The wait is the work

Dhirendra Kumar
Editor-in-chief

There is a particular kind of investor suffering that does not get enough attention. It is not the suffering of someone who made a terrible mistake—bought the wrong fund, chased a hot theme, panicked and sold at the bottom. Those stories get told often enough. The suffering I am thinking of is quieter and, in some ways, crueller. It belongs to the investor who did everything right and still spent three years staring at a return figure that made them question whether they had done anything right at all.

That investor is the subject of our cover story this month, and what the story reveals about the mathematics of compounding in the early years of a SIP is genuinely illuminating--not in a vague, motivational sense, but in a precise, data-backed sense that ought to change how investors read the numbers on their fund apps.

The core of it is this: a SIP return, especially in the first few years, is not a stable report card. It is a highly sensitive instrument that amplifies market movements by a factor most investors do not intuitively understand. An 18 per cent market correction can cause an early-stage SIP's XIRR to collapse by 35 percentage points—not because the investor erred, but because a small, growing corpus works that way. This is not bad news dressed up as good news. It is simply how the maths works, and understanding it changes how one sits with the discomfort.

The cover story explains the maths in full, and I would encourage every SIP investor to read it carefully. If you want a simpler way to hold the idea in your head, here is one I find useful. A SIP is not one investment. It is a series of separate monthly investments made at the market price for that month. The SIP mechanism is simply a convenience that automates them. When you think of it that way, the impact of a market fall becomes immediately legible. If the market drops to the level it was at six months ago, your last six instalments will be underwater. Not your entire portfolio—just those six. The ones before them, made when prices were lower, are doing fine. You can see this clearly in your head, without any spreadsheet. The investor who intuitively understands that a correction hurts only the recent instalments and actually helps the ones yet to come is far less likely to make the error that truly costs money: exiting.

- Early SIP returns can look misleading and discouraging
- Short-term discomfort is part of long-term compounding
- Understanding SIP maths helps investors stay patient

Because that is where the story gets serious. Patience in investing is not a personality trait some people are lucky enough to be born with. It is a conclusion you arrive at through understanding. The investors who stayed through the Global Financial Crisis and the ones who switched to the apparent safety of debt at the bottom are not fundamentally different kinds of people. They had varying understandings of what staying invested actually meant. The cover story puts that information front and centre.

Thirty years of writing about investing have taught me that the financial industry has a structural incentive to keep investors busy—new funds, new themes, new reasons to act. Compounding has the opposite requirement. It asks for inaction, or more precisely, the continuation of a single well-considered action over a very long time. The two are in constant conflict, and most of the time, the industry wins, not because investors are foolish, but because doing nothing is genuinely hard when the numbers look alarming.

What the data in our cover story make clear—across every market cycle since 1979 and across cohorts that started SIPs at the worst possible times—is that the destination was never really in doubt. The only variable was the length of the journey and the investor's willingness to stay on the road.

The maths, given enough time, always finishes what you started.

DHIRENDRA KUMAR

Be the investor who can sleep during crises

Peace of mind comes from not needing to predict the war

There is a reliable pattern to what happens in my inbox during periods like these. On an ordinary week, the questions that come in through **Fund Advisor** and from members generally concern funds, whether to pick one, whether to shift from one category to another, what to make of a particular fund manager's recent decisions. They are, in other words, questions about investing.

But when oil prices spike and television anchors start shrieking even louder than normal, the questions that arrive are not really about funds at all. They are about fear. They arrive dressed as investment queries, "Should I pause my SIPs?", "Is this a good time to move to debt?", "How much has my portfolio fallen?" But what they are actually asking is something simpler and more human: Is everything going to be all right?

I have been in this business long enough to have received versions of that question many times. During the dot-com collapse. After the 2008 crisis. During the Covid crash of March 2020. And now, with conflict near the Strait of Hormuz sending oil prices past levels that make people genuinely nervous. Each time, the question is the same. And each time, the honest answer is the same: probably yes, but not because of anything you can do about it in the next 48 hours.

The ability to bring all your family's investments into a single view is the most important crisis-management tool a retail investor can have

What I find more interesting than the question, though, is the anxiety underneath it, and where that anxiety actually comes from. In my experience, the investors who are most rattled during a crisis are not necessarily those whose portfolios have fallen the most. They are the ones who cannot clearly see what they own.

The investor who has accumulated funds across three platforms, in the names of various family members, some bought through an advisor, some directly, some remembered, some half-forgotten, is in genuine trouble during moments like this. Not because his portfolio is necessarily worse than anyone else's, but because he cannot see it. And what you cannot see, your imagination will fill in for you, almost always with something worse than the reality.

This is one of the things I had in mind when we built the portfolio analysis tools in Value Research Fund Advisor. The ability to bring all your family's investments into a single view, your own, your spouse's, your parents', your children's, is not merely a convenience feature. It is, I would argue, the most important crisis-management tool a retail investor can have.

When you can see everything in one place and each fund has a clear Buy, Sell, or Hold signal attached, the question "should I do anything?" mostly answers itself. You look and see that your SIP ran as scheduled, that the funds you hold are rated the same as last month, and that no alarms have been triggered on any of them. You close the app. You get on with your day.

The deeper argument, though, is one worth making explicitly.

> A well-constructed portfolio, one built around your actual goals, your time horizon and a sensible allocation across asset types, was already designed for exactly this kind of crisis.

Illustration: Anand

Not because anyone at Value Research predicted an Iran conflict, or because our Portfolio Planner has a view on the Strait of Hormuz. It has no such view, and neither do I. What a goal-based portfolio assumes, at the construction stage, is that bad things can happen. That there will be periods of sharp market falls. That oil will spike, or interest rates will move unexpectedly, or some geopolitical event will cause headlines that feel, in the moment, like the beginning of something permanent.

The asset allocation built into your portfolio is the acknowledgement of that uncertainty, expressed in numbers. It is, in a sense, the opposite of a prediction. It is a systematic admission that we do not know what will happen, and a structure built to survive that not-knowing.

This is what distinguishes goal-based investing from the more common alternative: investing based on a general feeling that the future will look more or less like the recent past.

> **The most** valuable thing Fund Advisor provides during a crisis is not advice but clarity

That second kind of investor is the one most destabilised by moments like these. His mental model has been disrupted. The goal-based investor, ideally, experiences something different, not indifference to what is happening, but a recognition that such events were already, in a sense, anticipated. Not predicted, but budgeted for. I am aware that this can sound too easy. The gap between knowing you should hold steady and actually holding steady, when your cooking gas is becoming more expensive and the news is relentlessly grim, is not trivial.

This is exactly why I believe that the most valuable thing Fund Advisor provides during a crisis is not advice, it is clarity. I can give advice in a column, or at **Fund Advisor Live** on Saturday mornings when my team and I work through member questions in real time. What a column cannot give you is the ability to look at your own specific situation, with your own specific funds, and see that it is intact. For that, you need to be able to see your portfolio clearly. Most Indian investors, if they are honest, cannot do this on an ordinary day. During a crisis, the cost of that opacity becomes very visible.

There is one more thing worth saying. When crises like these arrive, a certain kind of financial intermediary becomes very active. Calls get made. Meetings get proposed. The message, sometimes spoken and sometimes implied, is that something should be done, and that doing it requires going through the intermediary.

I am not suggesting that all of this is cynical, some of it is genuine concern. But the structure of commission-based advice means that action always pays the seller better than inaction.

The flat-fee model that Fund Advisor runs on has no such incentive. When I say your portfolio is probably fine and you should leave it alone, there is no revenue consequence for my company either way. That alignment, between what is good for you and what our business model rewards, is worth a lot when everyone else appears to have a strong view about what you should do urgently.

Questions like the ones arriving in my inbox are usually answered not by anything I say, but by the passage of time. Investors who can see their portfolios clearly and who find them to be what they expected will find it easier to stay calm than those who cannot. That is the design intention. And on the evidence of the past 30 years, it still holds. ☑

READERS' VOICE

Letters to the Editor's Note

Responses to the February 21 editorial, 'Paper gains, very real taxes'

Dhirendra Kumar's Editor's Note, *Paper gains, very real taxes*, published on February 21, 2026, examined a controversial proposal in the Netherlands to tax unrealised investment gains. He argued that taxing paper wealth before it is actually realised risks distorting incentives and forcing investors to sell assets simply to meet the tax bills.

The piece struck a chord with readers familiar with India's own history of punitive taxation and its unintended consequences.

Aditya Roy/AI-generated image

Summary

For decades, a simple principle has guided sensible investment taxation: you pay tax when you actually make money—when you sell an asset and pocket the proceeds. The gain must be real, not merely a number on a screen. The Netherlands is now proposing to abandon this principle.

From 2028, the Dutch government plans to impose a 36 per cent tax on investment returns that includes unrealised gains. If shares bought for €100 rise to €130 by year-end, investors would owe tax on the €30 increase—even though the asset has not been sold and the gain exists only on paper. The reform is meant to replace an earlier system that taxed a notional return regardless of actual earnings. Yet, under judicial compulsion, the 'correction' has produced a mechanism that could force investors to sell assets simply to pay tax on gains that may vanish the next year.

The larger concern is not the Dutch reform itself but the broader ideological shift it represents. In many policy circles and online discussions, taxing paper wealth is increasingly portrayed as an obvious act of justice. Within this worldview, market value is treated as money that governments are entitled to immediately, not when assets are actually sold.

India's history offers a cautionary example. In the early 1970s, the top marginal income tax rate reached 97.75 per cent, while wealth tax imposed annual levies of up to 8 per cent on the market value of assets. Though not technically a tax on unrealised gains, it had the same effect: rising asset values increased tax bills regardless of actual income. The result was tax burdens exceeding income, widespread evasion, the rise of black money and decades of economic stagnation. What India learnt painfully over 30 years, other countries now seem eager to rediscover.

READERS' VOICE

What our readers say

The first time I heard the word 'Dutch' in this context was at a restaurant with friends when we agreed to go 'Dutch.' Shared equally—very sociable indeed. I never imagined the Dutch government would abandon normal principles and make it taxing for people simply to earn a living.
I hope policymakers here in India do not get carried away and enact similar provisions that scrape away whatever is left in our bowls.

Prem Anantaraman

You have raised a very pertinent issue. Even NRIs living in the US are now required to declare and pay taxes on their holdings in India. Politicians often promise a utopian life, but the reality for the common man tends to be a much harder landing.

Ajay Gupta

The intention of the neo-nationalist lobby seems clear. If you cannot help people become rich, create systems that prevent them from becoming rich. In the end, people simply hide income and wealth, leading to the growth of a black economy.

Praveen Godbole

It is not just stupid—it is absurd to levy tax on gains that have not yet materialised and may turn into losses in the future, as you rightly pointed out. I was happy when CPI and CPI-M progressively lost their grip on India and when the USSR collapsed 35 years ago. It now seems that the population of the socialist, good-for-nothing brigade is trying to grow again. All progressive and capable people in the Netherlands must oppose this idiotic notion.

Sridhar Neelakantan

While I oppose the idea, governments could still address inequality through indirect measures—higher GST on luxury consumption, higher STT on large trading volumes, and more expensive loan rates when stocks are used as collateral.
Long-term capital gains tax could remain low or even zero.
Housing shortages and restrictive zoning laws in Europe should also be addressed before such taxation experiments.

S Raju

Thank you for highlighting the absurdity of taxing notional gains based on market value. In the US, something similar exists under the Passive Foreign Investment Company (PFIC) rules for non-US mutual funds. India also has a somewhat comparable situation in property transactions. Capital gains are calculated using stamp duty value or actual sale price, whichever is higher. While intended to curb black money, it sometimes forces genuine sellers to pay tax on gains they never actually received.
Let's hope we do not follow the Netherlands down this path and return to the tax regime of half a century ago.

Sunil Kothare

Thank you for the enlightening note. It becomes quite scary when you put it this way, and the consequences could be huge. However, isn't some form of "tax on unrealised gains" already prevalent? For example, interest from fixed deposits is taxed each year, even if the interest is reinvested or cumulative and not withdrawn. Mutual fund gains, of course, are taxed only on redemption.

Instead of squeezing the middle class further, governments could reduce administrative overheads and curb wastage. Perhaps something like the 'DOGE' approach could help.

You are spot on about the Netherlands heading into territory that India experienced in the 1970s. I'm no expert—just sharing the concerns of a senior citizen dependent on interest income.

PERSONAL FINANCE INSIGHT

Are your pay hikes funding wealth or lifestyle?

Two ratios that show whether income is turning into assets

By Siddhant Madhav Joshi

They earn earlier. They upgrade faster. They borrow instantly.

Gen Z entered the workforce in a period of rising salaries and seamless credit. Credit cards are approved in minutes. Buy-now-pay-later sits one click away. Travel, gadgets and lifestyle upgrades can be converted into EMIs almost instantly.

While income has arrived early, so has leverage. The result is young professionals with respectable pay but surprisingly thin balance sheets.

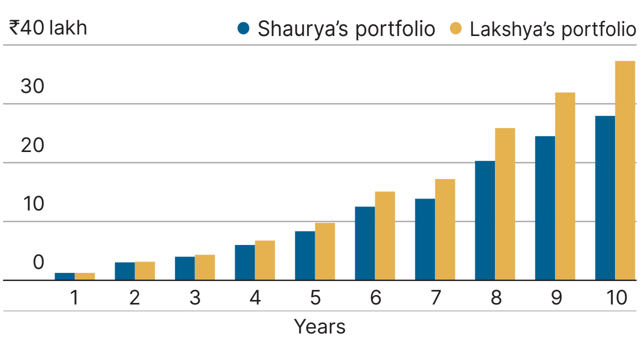
The real question is not whether Gen Z earns well. Many do. The question is whether those earnings are turning into assets or just being absorbed by increasing consumption.

The behavioural shift

Credit bureau data supports what we increasingly observe on the ground. CRIF High Mark's 2025 data shows borrowers under 30 are among the fastest-growing segments in unsecured retail credit, with higher early-stage delinquency rates than older cohorts.

Same salary, very different wealth

Small increment discipline creates big long-term gains



Both start with a monthly salary of ₹50,000 10 years ago, growing at 6 per cent annually, and invest in an average active direct flexi-cap fund. Both begin with a ₹10,000 SIP. Shaurya allocates 5 per cent of every annual increment to his SIP, while Lakshya allocates 35 per cent. Final portfolio values as of January 31, 2026.

Yogesh Sharma/AI-generated image

Access is instant. Consequences are slower.

Older generations often followed a simple formula:

Expenses = Income – Savings

Savings came first. Spending adjusted.

Today, the formula often reverses:

Savings = Income – Expenses

Spending is immediate. Saving is residual.

The difference looks small in a month, but is decisive over a decade.

Income alone does not determine financial strength, but how much of it stays with you does.

Two indicators reveal which direction a young professional is heading.

Indicator 1: Wealth capture ratio

Wealth capture ratio = Net investible financial assets ÷ cumulative lifetime earnings

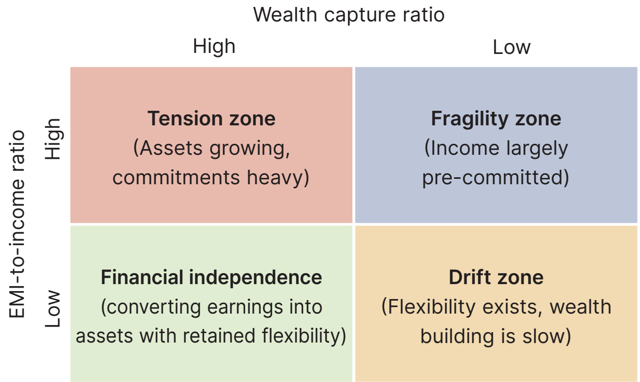
It measures how efficiently your earning years are turning into assets you truly own.

Net investible financial assets include mutual funds, stocks, retirement accounts and deposits, minus unsecured debt such as credit cards and personal loans.

We have excluded real estate. A heavily leveraged

Where do you stand today?

Wealth capture and EMI discipline define resilience



home can inflate perceived wealth and act as a burden during uncertain times such as job loss. Additionally, the house you live in is a shelter first, not a financial asset.

If you have earned ₹50 lakh and own ₹5 lakh in net financial assets, your capture ratio is 10 per cent.

Broad directional bands:

- Below 10 per cent: Low conversion zone
- 10–20 per cent: Building zone
- 20–40 per cent: Strong capture zone
- Above 40 per cent: Compounding zone

These are not rigid targets, but signals. Moving from 5 per cent to 25 per cent meaningfully alters long-term outcomes.

Two professionals can earn the same salary, invest in the same fund and still end up with very different wealth.

Consider Shaurya and Lakshya. Both started 10 years ago with a ₹6 lakh annual in-hand salary. Both invested 20 per cent of income in the same flexi-cap fund. The difference? Shaurya directed 5 per cent of every raise into investments. Lakshya directed 35 per cent.

That behavioural gap compounded into a wide divergence in wealth. (See graph: 'Same salary, very different wealth.')

Indicator 2: EMI-to-income ratio

EMI-to-income ratio =
Total monthly EMIs ÷ monthly income

This ratio measures flexibility. It shows how much of your future income is already committed.

Broad safety bands:

- Below 15 per cent: Flexible zone
- 15–33 per cent: Manageable zone
- 33–50 per cent: Stress zone
- Above 50 per cent: Fragility zone

Beyond one-third of income, increments begin disappearing into repayments. Above half, resilience drops sharply. A job loss or illness can destabilise cash flow quickly.

High EMIs shrink optionality. Raises get pre-allocated. Investing becomes secondary.

Low wealth capture combined with high EMIs creates structural vulnerability. In such cases, a single disruption can force you to halt SIPs and trigger redemptions.

The framework is not about guilt. It is about clarity. The illustration 'Where do you stand today?' shows how these ratios interact.

Preventive guardrails

If the numbers feel uncomfortable, structural changes matter more than motivation:

- Capture every increment. Pre-commit a portion of each raise to investments.
- Keep EMIs within protective limits. Choose long-term investing over short-term desires.
- Automate investments on salary day.
- Maintain a liquidity buffer to avoid stopping long-term investments.
- Track your wealth capture ratio annually. Observe whether your earning years are building wealth.

Small behavioural shifts compound more reliably than market timing.

Final words

The thresholds above are illustrative and should not be treated as fixed rules. Different life stages demand different trade-offs, and no single framework can capture all of life's variables. That said, financial strength should not come at the cost of well-being or meaningful experiences. The aim is not perfection, but direction.

While a high income creates opportunity, wealth creation ultimately depends on whether income increments build assets in the background or get absorbed into lifestyle upgrades.

Over time, that decision, repeated month after month, matters more than salary. ☑

INSURANCE BASICS

Small add-ons to protect big claims

Why having health insurance riders is a necessity, not a choice

By Siddhant Madhav Joshi

Buying health insurance isn't just about getting a large sum-insured at a low premium. The actual difference shows up at claim time. Room rent caps, co-payment clauses, consumable exclusions and strict payout definitions can slash what you actually receive meaningfully.

That's where riders and add-ons come in. These are optional features that either remove restrictions in your base policy or layer on additional benefits. The goal isn't to buy everything on offer. It's to know which ones close a real gap for you.

First, fix the structural cracks

Before chasing extra benefits, look for weaknesses that can silently shrink your payout.

Room rent limits: Many policies cap the room category you can choose. Pick a higher room and your insurer may apply a proportional deduction across your entire hospital bill, not just the room cost. A room rent waiver eliminates this risk. If your plan doesn't already offer no caps on room rent, this rider deserves a serious look.

Restoration benefit: Even one major illness can potentially exhaust your sum insured. Multiple admissions in the same year can certainly put extreme pressure on your policy. A restoration benefit refills your cover after it's depleted. Many modern plans include this by default, but the conditions vary; some restore only for unrelated illnesses, others are more generous.

Co-payment reduction: Many policies require you to pay a fixed percentage of each claim. A co-payment waiver or reduction rider directly lowers that out-of-pocket share, which can lead to meaningful savings over time.

Consumables cover: Gloves, syringes, masks, etc., get billed, but most standard policies don't reimburse them. The deductions might look small per item, but they add up. A consumable cover rider prevents these repeated cuts to your claim.

Some riders protect income, not just bills

These don't reimburse hospital expenses. They pay a fixed amount when a serious event occurs.

Critical illness rider: A lumpsum is paid on diagnosis of specified serious conditions such as cancer, heart attack or stroke. The payout is not linked to hospital bills, and once the amount is paid, the base policy benefit typically ends. The policyholder is free to use the money at their discretion, whether for treatment, recovery expenses, household needs or income support during time away from work. Payouts, however, depend on meeting defined illness severity criteria and survival periods specified in the policy.

Personal accident cover: Pays a lumpsum for accidental death or permanent disability. This can be valuable if you don't have a standalone accident policy. Less necessary if you're already well covered under life insurance.

Hospital cash: A fixed daily amount during hospitalisation, which may be useful for incidental expenses if you don't maintain a separate emergency fund. However, if you do, the incremental value rarely justifies the added premium.

The simple rule

Strengthen your base policy first. Lift room rent caps. Reduce co-payments. Confirm restoration. Understand your exclusions. Then consider riders that guard against income loss from severe events.

Don't buy every add-on on offer. Buy only what fills a genuine gap. In health insurance, clarity beats complexity every time. ☑

[FUND RADAR]

Investing beyond India

Here are the international funds open for investment

By Pranit Mathur

For decades, geography was a constraint Indian investors simply lived with. Capital stayed at home, whether it wanted to or not.

The arrival of international mutual funds changed that reality. They opened a gateway to the world's largest companies without requiring a foreign brokerage account or dealing with currency conversion.

Then, in early 2022, that gateway abruptly narrowed. SEBI directed fund houses to halt fresh investments in international funds after the industry collectively approached the Reserve Bank of India's $7 billion overseas investment ceiling.

That limit still exists. What has changed is the breathing room within it.

As some fund houses free up capacity, others temporarily reopen their funds to fresh subscriptions. The result is a narrow, rotating window for investors looking to allocate internationally.

We have mapped that window for you. The funds listed below were open for subscription as of March 9, 2026. Given how quickly availability can change, treat this list as time-sensitive. ☑

International funds still open for fresh investments

Surviving market storms

Low-volatility funds promise calmer investing. We check if that holds up.

By Siddhant Madhav Joshi

Markets have spent the past 18 months lurching without getting very far. For SIP investors, the reward has been thin: the Nifty 100 and Nifty 500 have delivered only about 4 to 6 per cent annualised returns.

The mix of muted gains and sharp swings is beginning to test investor patience. In such phases, strategies promising a gentler ride attract attention. Low-volatility funds are now being pitched as a way to stay invested without enduring the full turbulence. The natural question is whether they offer that relief, especially for those who find wild market moves hard to stomach.

But first, what is low-volatility investing?

It is a factor-based strategy that selects stocks with lower price swings. Starting with a universe like the Nifty 100 or Nifty 500, stocks with relatively smaller fluctuations (typically measured through one-year standard deviation) are chosen and weighted to form an index, with periodic rebalancing to maintain that profile.

The category is still in its infancy. Only about 13 passive schemes exist, most with less than five years of track record. The majority track the Nifty 500 Low Volatility 50 or the Nifty 100 Low Volatility 30 indices.

Does the strategy deliver on its promise?

Low-volatility investing rests on two claims. First, that it falls less in bad phases. Second, that by losing less, it delivers better long-term returns. It largely delivers on both.

Across major corrections of more than 15 per cent, the Nifty 500 Low Volatility 30 always fell less than its parent index and recovered faster. See table titled 'Softer landings in declines'.

In 2020, for instance, the Nifty 500 crashed nearly 38 per cent while its low-volatility peer limited the fall to 29 per cent and recovered two months earlier.

This pattern also holds true for the Nifty 100, whose low-volatility counterpart declined less in each downturn and recovered more quickly afterwards.

The second claim holds up as well. The two indices have mostly outperformed their parents over the past two decades. Between April 2005 and February 2026:

- Nifty 100 Low Volatility 30 outperformed its parent index in

Softer landings in declines

The low-volatility index has fallen less during major corrections and recovered faster

Correction periods	Nifty 500		Nifty 500 Low Volatility 30	
	Drawdowns (%)	Recovery years	Drawdowns (%)	Recovery years
2011	-27.9	2.0	-20.6	0.8
2016	-20.7	0.4	-16.0	0.3
2018	-15.6	1.2	-14.2	0.6
2020	-37.6	0.6	-29.0	0.4
2022	-18.3	0.4	-14.9	0.5
2025	-19.1	1.0*	-16.4	0.5

Data from January 3, 2011 to February 19, 2026. Correction periods denote phases when the Nifty 500 fell more than 15 per cent. Recovery years indicate time taken to regain prior peak from the bottom. *As of February 19, 2026 since previous peak hadn't been reclaimed yet.

Low-volatility wins more often, but not by much

The probability of beating the market rises with time, but the edge remains small

	% of times outperformed			
	3-year periods		5-year periods	
Margin of outperformance	Nifty 100	Nifty 500	Nifty 100	Nifty 500
Less than 2% p.a.	26.1	23.2	41.4	39.8
More than 2% p.a.	57.7	57.3	54.1	51.6
Total outperformance	**83.8**	**80.5**	**95.5**	**91.4**

Data from April 1, 2005 to February 19, 2026 considered.

about 84 per cent of all possible three-year windows. The Nifty 500 counterpart did so roughly 80 per cent of the time.

- Across all five-year holding periods, the outperformance rises sharply to over 90 per cent of the time for both.

Note that this consistency captures phases when the indices not only gained more but also declined less, helping them outstrip the broader market.

However, the magnitude of their outperformance is rarely dramatic. That reiterates the strategy as a way to smooth the journey and not maximise returns.

What to bear in mind about this strategy

It's not built for spectacular returns. The earlier analysis also reveals the limits. Investors expecting eye-catching outperformance may be disappointed, particularly over long holding periods. In nearly 40 per cent of all five-year windows, for instance, the Nifty 500 Low Volatility 30 index beat its parent by less than 2 percentage points a year, a gap that may not be as meaningful for investors bullish on the idea.

In other words, the strategy can edge past the broader market more often, but the advantage can tend to thin over longer periods. Its real appeal remains a smoother return profile, not dramatically higher gains.

Factors rotate. This is after all a factor strategy, and factors rarely stay in favour forever. Low volatility, like value or momentum, moves through cycles. There can be extended stretches when it lags the broader market. Investors therefore need patience and should not assume that past excess returns will repeat with the same consistency or magnitude.

Index history is not the same as fund experience. Much of the strategy's appeal rests on index data. But the funds available to investors are still young. Real-world products face frictions that indices often don't like: expense ratio and rebalancing costs that lead to tracking differences. Many offerings are ETFs, which introduces another layer of execution risk through liquidity and bid–ask spreads. In a strategy where the expected edge is often just a percentage point or two over long periods, such frictions can meaningfully erode the advantage.

No factor wins every year

Factor leadership keeps shifting across market phases

2020	2021	2022	2023	2024	2025
Quality 27.6	Momentum 78.9	Value 23.2	Value 62.6	Alpha 27.3	Value 16.9
Equal Weight 27.1	Value 56.4	Low Volatility 7.3	Alpha 57.5	Momentum 27.0	Low Volatility 16.1
Low Volatility 24.7	Alpha 56.2	Nifty 100 4.9	Momentum 47.7	Quality 23.1	Nifty 100 10.2
Alpha 23.1	Equal Weight 50.2	Nifty 500 4.2	Equal Weight 42.5	Equal Weight 22.9	Nifty 500 7.8
Momentum 21.0	Nifty 500 31.6	Equal Weight 1.6	Quality 41.9	Value 20.1	Equal Weight 1.0
Nifty 500 17.9	Quality 29.9	Quality -2.8	Low Volatility 33.4	Nifty 500 16.1	Quality -2.6
Nifty 100 16.1	Nifty 100 26.4	Momentum -7.6	Nifty 500 26.9	Low Volatility 15.8	Alpha -4.7
Value 8.5	Low Volatility 20.9	Alpha -8.8	Nifty 100 21.2	Nifty 100 12.8	Momentum -7.6

Total return index considered. Nifty 200 Alpha 30, Nifty 500 Equal weight, Nifty 500 Low Volatility 50, Nifty 500 Momentum 50, Nifty 500 Value 50 and Nifty 500 Quality 50 are considered to represent their respective factors.

Your takeaway

Low-volatility funds have a clear but limited role: to cushion against drawdowns and enable a frictionless ride. They prove their worth during sharp market corrections and the slow recoveries that often follow. If staying invested during market turbulence is your biggest challenge, the strategy can help. But if you aim to maximise returns in every phase, it will likely disappoint.

Use it therefore as a satellite holding, not a core one. It should complement a broad-market flexi-cap or multi-cap fund, but not replace one. An allocation of about 10 to 20 per cent of the equity portfolio will be enough to soften portfolio swings without turning the portfolio into a concentrated factor bet. ☑

FUND RADAR

Small caps: Where active funds pull ahead

Skill and selectivity leads to better outcomes

By Abhishek Rana

Here's a data point for you to chew on: In the market decline that began in September 2024, over 80 per cent of active small-cap funds held up better than the small-cap index by simply falling less. The Nifty Smallcap 250 index was still 10 per cent down as of mid-February. The average small-cap fund was down much less at 5.8 per cent.

This naturally calls for revisiting an old, popular dilemma: when you invest in small caps, does picking an active fund get you better outcomes than owning the index? Data shows that more often than not, you do.

Most small-cap funds beat the index over long term

Prior to 2018, small-cap funds could freely invest anywhere in the market to maintain outperformance. So, we analysed five-year rolling returns from 2018 onward after SEBI categorisation clearly defined the category's investing mandate.

What we found:

- Ninety-one per cent of active small-cap funds delivered higher average five-year rolling returns than the Nifty Smallcap 250.
- The average outperformance of these funds was a handsome 4.1 per cent per annum.
- In large caps, by comparison, only about half the funds managed to outperform, and that too, by a slimmer 1.9 percentage points on average.

This shows how most active small-cap funds don't just win; they win with a sizable gap.

Do they also win in market turmoil?

Mostly, they have in the past. For this, we considered crash periods as those when the Nifty Smallcap 250 declined at least 15 per cent. We also considered the performance during market recovery. For that, periods where the index climbed back to its previous highs (peak-to-peak) were considered, not including the latest fall that is yet to recover.

What we found:

- In all three corrections, all active small-cap funds fell less than the index, outperforming by an average of 3 to 10 percentage points.
- Lower declines meant they also recovered faster, surging ahead of the index, that simply climbed back to its peak with near-zero returns.
- For instance, the index merely recouped losses over three years between January 2018 and May 2021. But an average active small-cap fund gave 28 per cent returns during this time. See table 'When markets crack, active holds up'.

Why do active small-cap funds do better?

Because small-cap stocks are not only volatile but also inefficient. The gap between strong businesses and fragile ones is wide. And fund managers, by being selective, enjoy a stronger cushion during market stress.

Better stock selection. The small-cap 250 index by design holds everything that qualifies as a small cap, meaning stocks between 251 and 500 in market-cap

When markets crack, active holds up

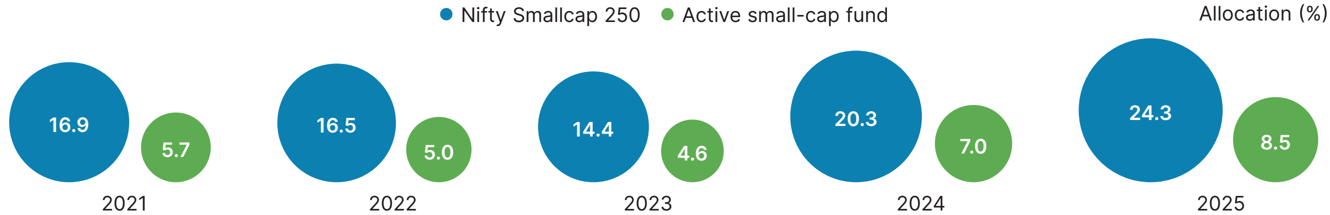
Since 2018, most active small-cap funds have fallen less and pulled ahead stronger vs the index

Crash period	% of funds beating index	Index return (%)	Average active fund return (%)
Jan-18 to Mar-20	100	-59.8	-46.1
Jan-22 to Jun-22	100	-26.6	-20.3
Sep-24 to Mar-25	100	-26.0	-22.7
Previous peak to next peak			
Jan-18 to May-21	92.9	0	28.1
Jan-22 to Jun-23	95.7	0	9.6

Crash periods are peak-to-trough phases where the Nifty Smallcap 250 fell at least 15 per cent. The previous peak-to-next peak is the time it took the index to reclaim its earlier high. Data of direct plans is considered.

Active funds own fewer weaklings

An average active small-cap fund tends to hold far less in poor-quality stocks than the index



Poor-quality stocks were those with a Value Research Quality Score of 1, 2, or 3 at the time. Monthly allocations were averaged to arrive at the annual average exposure. Only full calendar years were considered.

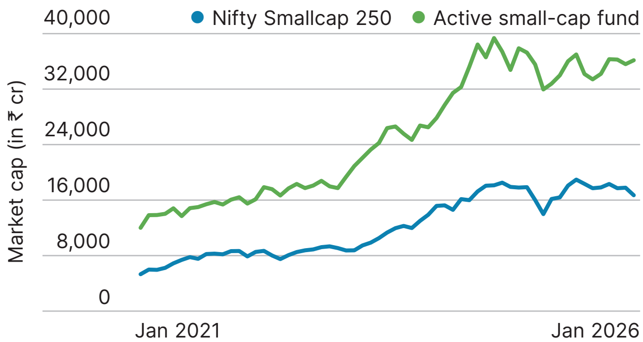
ranking. That means it also ends up owning even shaky businesses. Active funds don't have to. They can skip weak balance sheets, highly leveraged businesses and the kind of frothy names that unravel first in a downturn. In short, they avoid poor-quality stocks. And that shows up in their returns.

For instance, over the last five years, poor-quality stocks (defined later) on average made up between 14 and 24 per cent of the Nifty Smallcap 250's allocation, compared to 5 to 8 per cent in the average active small-cap fund. That gap shows how active managers keep far leaner exposure to the weakest names while the index bound by rules must hold any stock that is a small cap.

Poor-quality stocks were those rated one, two or three out of 10 on **Value Research Quality Score**, which captures a company's business efficiency and balance-sheet strength. The data was calculated by examining the monthly holdings of these stocks in both the index and an average active small-cap fund

Active funds prefer bigger stocks

An average active small-cap fund holds more larger-sized companies than the index



Monthly figures show the AUM-weighted average market cap across active small-cap funds.

and averaging for each year. See chart 'Active funds own fewer weaklings'.

Portfolio flexibility. Another factor that explains the outperformance of active funds is that they are required to invest only 65 per cent in small caps, leaving up to 35 per cent available for mid- and large-cap stocks. The Nifty Smallcap 250 by comparison needs to have complete exposure to small caps alone.

Active funds thus freely use this flexibility to their advantage. On average, they allocate about 80 per cent to small caps with the remaining 20 per cent parked in relatively larger companies.

This is clear in the market-cap trend over the past five years. The average market capitalisation of stocks held by active small-cap funds has consistently been higher than that of the index, suggesting higher preference for larger stocks. This also helps them maintain smoother returns.

To sum up

When investing in small caps, you will never have a smooth ride. They experience sharper corrections, wilder swings and longer recoveries compared to their bigger counterparts. Your patience will always be tested.

But the data analysed in this story still suggests something important: within this volatile space, active small-cap funds have historically done a better job than the index especially when markets were hostile. They have fallen less during crashes and recovered faster afterwards. In longer periods, most have also delivered meaningful outperformance.

Thus in this segment, which almost never escapes market lashings, selectivity matters. For investors seeking small-cap exposure, that makes active funds a better and more practical option. ☑

FUND RADAR

The tax-smart debt fund

A look at income plus arbitrage funds and their tax advantage

By Siddhant Madhav Joshi

For debt fund investors, the 2023 tax change was a setback. Earlier, long-term gains enjoyed indexation benefits that reduced the tax burden. That was scrapped, and gains are now taxed at the investor's income slab rate.

Fund houses quickly responded with a new category that attempts to offer the stability of debt funds without their tax inefficiency: income plus arbitrage funds.

These funds, a mix of debt and arbitrage, prove to be most useful for high earners. They lower the tax burden as they are taxed at a long-term capital gains rate of 12.5 per cent if held for at least two years, rather than slab rates applied to traditional debt funds.

So on a ₹1 lakh gain for instance, an investor in the highest tax bracket would pay ₹30,000 in tax in a traditional debt fund. In an income plus arbitrage fund, the tax would be ₹12,500 after two years. The savings are compelling for high-tax-bracket investors.

How they work

Income plus arbitrage funds are fund-of-funds (FoFs) that invest in other mutual funds. The debt component comprises debt funds across durations and issuers. The arbitrage portion (funds) captures price differences of a stock between the cash and futures markets.

By allocating 35–65 per cent to arbitrage funds and the rest to debt funds, these schemes avoid being taxed as debt funds and qualify for lower taxation. But whether these funds can replace traditional debt funds warrants a closer look.

Factors before you consider them

The cost caveat: Because income plus arbitrage funds operate as FoFs, investors pay two layers of costs. The first layer is the expense ratio of the FoF itself. The second layer comes from the expense ratios of the underlying funds the FoF invests in.

The headline expense ratio shown on most fund pages reflects only the parent scheme's fees, not the full cost. When both layers are considered, the actual expense ratio for the category ranges roughly between 0.23 per cent and 0.76 per cent annually. Only about a

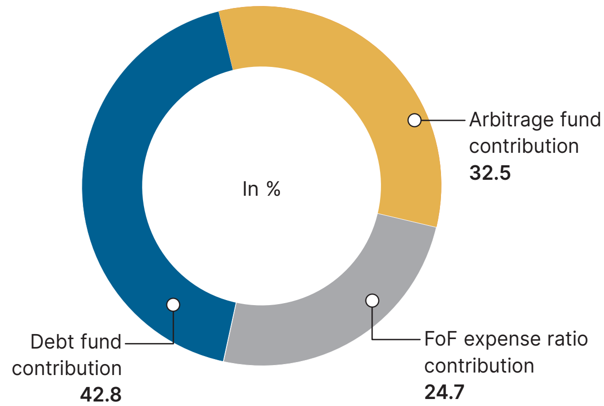
Vinayak Pathak/AI-generated image

fraction of that cost is visible at the FoF level. Investors comparing only the displayed expense ratio may thus underestimate the true cost.

How do they fare on returns: An equally important question is whether these funds deliver returns comparable to debt funds. But note that performance analysis is somewhat limited in this category since nearly 12 of the current 21 funds are less than three years old, reflecting the wave of launches after the

The hidden cost of FoFs

Only about 25 per cent of the total expense is visible on the fund fact sheet



Based on median portfolio allocations of income plus arbitrage FoFs as of February 28, 2026.

MUTUAL FUND INVESTMENTS ARE SUBJECT TO MARKET RISKS, READ ALL SCHEME RELATED DOCUMENTS CAREFULLY.

2023 tax change. Only about one-third have a track record longer than 10 years.

Even so, we examined the category's daily rolling returns across one-, three- and five-year periods over the past decade.

- The median fund has delivered returns broadly similar to short-duration debt funds. See table: Similar returns to debt funds but with occasional losses.
- Over every possible three-year period for instance, the category gave a median return of 7.6 per cent per annum at par with short-duration fund's 7.9 per cent.
- Further, they outperformed short-duration funds in roughly 61 per cent of all three-year holding periods.

However, for debt investors, the primary objective is not just steady returns but also avoiding negative outcomes or loss of capital.

Chances of negative returns: On this front, these funds show a small but noteworthy difference. Because part of their portfolio depends on arbitrage strategies linked to equity markets, there is a slightly higher chance of fluctuations in the short term.

Our earlier analysis shows that negative returns over short one-year rolling periods occurred about 0.5 per cent of the time. That frequency is extremely small, but it is not zero. And the worst one-year return was a negative 3 per cent. Over longer terms, there were no negative returns. Nonetheless, for investors expecting debt-like stability, even rare negative outcomes are worth taking notice of.

Do their returns improve after tax?

After accounting for tax, the outcomes differ sizably. Income plus arbitrage funds' outperformance over short-duration funds increases sharply from 61 per cent of the times (three-year rolling periods) before tax to 90 per cent of the times after tax for an investor in the highest tax bracket. Here's a more direct comparison. If you were in the 30 per cent slab over the past decade:

- A median short-duration debt fund taxed at a high slab rate would have given you a 5.7 per cent annual return in any three-year holding period.
- A median income plus arbitrage fund taxed at flat 12.5 per cent would have given 6.7 per cent per annum in comparison (if sold after two years).

Over time, even a one percentage point gap can compound significantly.

So who should invest in them?

Income plus arbitrage funds work best for a specific type of investor. They make sense if you:

- fall in the 15 per cent or higher tax bracket
- have an investment horizon of three to five years
- are okay with higher fees in exchange for tax efficiency

Tax saving is the biggest advantage of this category. For those in higher brackets, these funds can be particularly useful for preserving more of what you earn after tax.

But for those in lower or zero-tax slabs, the returns may not differ much as they are broadly on par with traditional debt funds. Then it's wise to remember their twin cost structure, and how their arbitrage component introduces a small possibility of short-term losses. ☑

Tax advantage grows with your income

Income + arbitrage funds beat short-duration funds more often after tax, especially for high earners

Income tax slab (%)	Outperformance probability: Pre tax (%)	Outperformance probability: Post tax (%)
5	60.8	26.0
10		55.6
15		66.3
20		78.4
25		85.2
30		90.4

Based on median three-year rolling returns of direct plans from February 2016 to February 2026.

Similar returns to debt funds but with occasional losses

Income plus arbitrage funds show a small chance of short-term losses

	1 year (%)		3 years (% p.a.)		5 years (% p.a.)	
	Median	Worst	Median	Worst	Median	Worst
Arbitrage fund	6.9	3.5	6.7	4.4	6.1	5.4
Short-duration debt fund	8.3	2.5	7.9	4.8	7.2	6.3
Income plus arbitrage fund	8.3	-3.0	7.6	2.6	7.9	3.7

The category median returns of direct plans are considered from February 2013 to February 2026.

We had investments, but no liquidity for an emergency

How one crisis taught us the importance of keeping money accessible

For years, I believed we were financially prepared. We had investments for long-term goals and contributions running regularly. On paper, everything looked responsible. We often reassured ourselves that if something unexpected happened, we would manage. Then came the emergency.

It was a medical situation that required immediate attention, the kind where decisions must be made in minutes. As we moved between hospitals and urgent phone calls, we realised that most of our money was tied up in long-term investments. The money existed, but we couldn't access it immediately.

In that stressful moment, the gap between investments and liquidity became painfully obvious. What we needed was quick access to money, not investments designed to stay untouched for years.

That experience forced us to rethink how we defined financial preparedness. Until then, we treated all our money as one pool; investments meant for long-term goals and funds that might be needed urgently were grouped together, assuming we could rearrange things if needed. Reality proved otherwise.

Emergency funds are for a specific purpose. They are not meant to chase returns. They exist so that when life takes an unexpected turn, money is available without delay.

Once the situation passed, we reorganised our finances with that lesson in mind.

We created a separate emergency fund designed purely for accessibility. This pool of money was kept in avenues that allow quick withdrawal when required. It sat alongside our long-term investments rather than replacing them.

That separation brought clarity. Money meant for future goals could remain invested without being disturbed by short-term crises.

Key takeaways

- **Financial preparedness is about access, not just accumulation.**
- **Emergencies require liquidity, not long-term investments.**
- **A separate emergency fund prevents forced withdrawals.**

At the same time, the emergency fund ensured that unexpected events would not force hurried financial decisions.

More importantly, it restored a sense of control. When emergencies occur, the situation itself is already overwhelming. Financial uncertainty should not add to that burden.

The experience reminded us that sound financial planning is not only about building wealth over time. It is also about ensuring that the right resources are available when life demands them.

Conclusion

Emergencies rarely arrive with warning. When they do, immediate access to funds matters far more than long-term returns.

An emergency fund acts as a financial buffer, allowing families to respond quickly without disturbing investments meant for future goals. By keeping a portion of money readily accessible, investors build resilience into their financial plans.

Planning for emergencies is therefore not separate from investing. It is an essential part of responsible financial management. When liquidity is built into the plan from the start, unexpected situations become easier to navigate and long-term goals can remain on track. ☑

SPECIAL REPORT

The women of India's money machine

Women leaders from India's finance industry reflect on the lessons that shaped their careers

This Women's Day, Value Research asked six senior women from India's mutual fund industry a different question, not what they have achieved, but what they have actually learned. About the work. About themselves. About what it truly takes to last.

The answers were not rehearsed. They were the kind of lessons that only come after years of doing the work.

The story you tell about yourself

Usha Raman has spent three decades in finance, from JPMorgan to heading internal audit at India's largest mutual fund, and today serves as Chief Compliance Officer and Company Secretary at Quant Mutual Fund. The advice she most wants younger women to hear has little to do with technical skills.

Usha Raman
Chief Compliance Officer & Company Secretary, quant Mutual Fund

"Before you enter the room, people already know who you are," she says. "Whether we want that story to be the way Google tells it, or whether we want to create that story entirely ourselves, that choice is ours."

Women, she observes, often do the work, collect the wins, and then stay quiet about it. Personal branding is not vanity, she argues. In a competitive industry, it is survival.

Her professional conviction runs just as deep. "We always follow the path of ethics and principle-based regulations," she says. In her experience, that path and the right business outcome are rarely as far apart as people assume.

The confidence nobody handed her

Aparna Karmase has spent more than 24 years in compliance across ICICI Prudential, BNP Paribas, Invesco and now Motilal Oswal AMC, where she heads compliance, legal and secretarial functions. She believes being a woman in a role that requires telling uncomfortable truths to powerful people can actually be a strength.

Aparna Karmase
Compliance Head, Legal and Secretarial, Motilal Oswal AMC

"As women, we are often prepared to set the right tone, whether in a family or an organisation," she says. "If we are confident that we are acting in the interest of investors and the organisation, we can explain this clearly to stakeholders."

That confidence came from understanding not just what regulations say, but why they exist and how to communicate that reasoning in language businesses understand.

Her advice to young professionals is simple: study the history of regulations, not just the text. The context behind a rule is often more valuable than the rule itself.

Permission to be imperfect

One line from Kamayani Nagar, Head of Retail Sales at Aditya Birla Sun Life AMC, may be the most necessary of all six conversations.

"We need to get it out of our heads that we are expected to be superwomen. It's a myth."

Kamayani Nagar
Head - Retail Sales, Aditya Birla Sun Life AMC Ltd

Nagar brings 23 years of financial services experience, a gold medal from IIM Indore and a background in journalism. Her point is not about lowering standards. It is about honesty with oneself.

Sometimes personal life will demand more attention. Sometimes professional life will. Choosing one over the other at different points is not failure. It is how people sustain long careers.

Investing in every PIN code

Madhu Lunawat, MD and CEO of The Wealth Company Mutual Fund, entered fund management through private equity and stressed assets, a space where the quality of the person running a business often matters more than the numbers themselves.

That experience shaped her investment philosophy.

"I always look at the promoter, not just the hard metrics but the softer aspects too," she says. "That is often where the real alpha is hidden."

Madhu Lunawat
Managing Director & CEO, The Wealth Company Mutual Fund

After years of managing wealth for family offices and institutions, she wanted to expand that opportunity across the country. That ambition led to MF Didi, an initiative that trains women at the grassroots level to become mutual fund distributors, offering them a career that is flexible, independent and entirely their own.

The competition she almost skipped

Cheenu Gupta, Senior VP – Fund Management (Equities) at HSBC Mutual Fund, had already secured a placement at a leading private bank after her MBA when she heard about a mutual fund competition offering a prize of ₹1 lakh.

She stayed back two days in an empty hostel to prepare, won the competition, and unexpectedly walked away with a job offer that changed her career.

Cheenu Gupta
Senior VP - Fund Management, Equities, HSBC Mutual Fund

"When you take a calculated risk, it may not pay off in the near term," she says. "But over the long term, it does pay off meaningfully."

Two decades of portfolio management later, that belief still guides her decisions. So does another principle.

"Conviction does not mean rigidity. If the drivers of an investment thesis are no longer intact, the fund manager must go back to the drawing board and take a call."

The joy of building something

Komal Narang, Chief Client Officer at Jio BlackRock Asset Management Company, left the scale of a large institution to join a startup backed by two global giants. For her, the answer is simple.

"It is the joy of creating," she says. "Very rarely in life do you get a chance to build something from the ground up." That instinct for clarity also shapes her view of the industry.

"A customer is looking for something simple that builds credibility and trust," she says. "The moment we started simplifying the message and speaking in a language that is not jargon-laden, scale became inevitable."

Komal Narang
Chief Client Officer, Jio BlackRock Asset Management Company

On women in finance, she is equally direct. "This is a highly meritocratic industry. After a point, gender becomes irrelevant. Your skill sets, how you are building a business, they take over."

Six women. Six different paths. One common thread: careers worth having are rarely built on being extraordinary every day. They are built by showing up consistently, holding your ground when needed, and trusting that honest work eventually speaks for itself. ☑

[SPECIAL REPORT]

What SEBI's new mutual fund rules change

Key shifts in equity schemes, portfolio overlap and a new category

By Abhishek Rana

Market regulator SEBI's new mutual fund categorisation framework, issued in late February, introduces meaningful changes for asset management companies (AMCs) and investors alike. Among the most notable are the tightening of portfolio allocation rules, limits on overlap in a few categories, and the introduction of a new mutual fund category replacing another. We round up these changes below.

Sakshi/AI-generated image

Equity threshold raised in key schemes

- First, some of the sectoral and thematic funds will now be treated as separate categories, instead of being clubbed together. This increases the number of equity scheme categories from 11 to 13.
- Second, a few strategy-based equity schemes—dividend yield funds, value funds, contra funds, and focused funds (restricted to a maximum of 30 stocks) now must maintain at least 80 per cent equity allocation, up from 65 per cent.

This higher threshold reduces room for fund managers to dial equity exposure down so that these

Lookalike alert

Fund houses and how many of their sectoral and thematic funds overlap significantly

	Quant	WhiteOak Capital	ICICI Prudential	Union	Kotak Mahindra	Axis	Invesco
No. of sectoral/ thematic funds with over 50% overlap	12	6	6	4	4	4	3
Highest overlap (% of portfolio)	79.5	64.2	60.2	65.1	55.8	53.5	76.2

Data as of January 31, 2026 disclosures.

funds remain distinctly equity-oriented in practice, not just by label.

Further, the non-equity portion of an equity scheme can be invested in money market instruments, gold and silver instruments, InvITs and other permitted assets, within prescribed limits.

Overlap limits in similar funds

- Fund houses can now run both a value fund and a contra fund. Earlier, they could offer only one of the two. However, the two schemes cannot have more than 50 per cent portfolio overlap.
- Similarly, fund houses cannot have more than 50 per cent overlap among their sectoral and thematic funds and with their other equity schemes (except large-cap funds).

The overlap will be computed on a quarterly basis using daily portfolio data. Existing schemes have been given a three-year glide path to meet these limits. If they fail to do so within this period, they may have to be merged. This signals a shift in regulatory focus from merely defining categories to enforcing genuine differentiation.

'Lookalike alert' table captures how many sectoral and thematic funds had over 50 per cent overlap with other equity schemes within the same fund house (excluding large-cap funds) as of January 31, 2026 disclosures. It also shows their highest overlap. The numbers confirm that some funds sold as different strategies can be quite similar at the portfolio level. The new mandate could thus lead to portfolio reshuffles, clearer mandates, or scheme mergers over the next three years.

For investors, the end result should be more clarity on what a scheme truly offers, though the transition could involve some short-term reshuffling.

Solution-oriented schemes replaced with Life Cycle funds

The regulator has also scrapped the solution-oriented category that mainly included children's funds and retirement funds. Existing schemes are now required to stop taking fresh subscriptions and will have to be merged into other schemes with a similar asset mix and risk profile.

Notably, this was not a small category. There were 12 children's funds managing over ₹25,000 crore in assets and 29 retirement schemes managing over ₹32,000 crore as of January 31, 2026. Over time, however, many such funds had started resembling hybrid or asset-allocation funds. That may explain the removal of this category and the introduction of a more defined product like life cycle funds.

Life cycle funds are open-ended mutual funds with fixed goal tenures of five, 10, 15, 20, 25 or 30 years. Their main feature is a pre-defined glide path, which means their equity-debt mix will automatically change as the scheme inches closer to its maturity.

In plain terms, their equity exposure will be higher in the early years and gradually reduce with an increase in the debt allocation as the goal approaches. Check the two tables with SEBI's prescribed allocation ranges for five- and 30-year tenures.

They can also take exposure in other assets like

Motilal Oswal	LIC	Aditya Birla Sun Life	Mahindra Manulife	Quantum	Franklin Templeton	Bank of India	SBI
2	2	1	1	1	1	1	1
75.2	58.3	63.7	61.9	61.0	56.5	54.3	52.4

How will the asset mix change in a 30-year life cycle fund

Years to maturity	Equity	Debt	Gold/Silver ETFs/ETCDs/InvITs
	Allocation (%)		
15-30	65-95	5-25	0-10
10-15	65-80	5-25	0-10
5-10	50-65	5-25	0-10
3-5	35-50	25-50	0-10
1-3	20-35	25-65*	0-10
< 1	5-20	25-65*	0-10

*For schemes with one to three years remaining to maturity, exposure to debt instruments shall be restricted to AA and above rated instruments, with residual maturity not exceeding the target maturity of the scheme. Source: SEBI.

How will the asset mix change in a 5-year life cycle fund

Years to maturity	Equity	Debt	Gold/Silver ETFs/ETCDs/InvITs
	Allocation (%)		
3-5	35-50	25-50	0-10
1-3	20-35	25-65*	0-10
< 1	5-20	25-65*	0-10

*For schemes with one to three years remaining to maturity, exposure to debt instruments shall be restricted to AA and above rated instruments, with residual maturity not exceeding the target maturity of the scheme. Source: SEBI.

InvITs, exchange-traded commodity derivatives, and gold and silver ETFs. Exit loads are graded to discourage early withdrawals: 3 per cent in year one, 2 per cent in year two, and 1 per cent in year three. Further, a fund house can have only six life cycle funds at any time. When a scheme has less than one year left, it can be merged into the nearest-maturity life cycle fund if unitholders approve.

Your takeaway

The new framework doesn't change much for retail investors. But it still does something useful: it makes fund labels harder to game and portfolios harder to disguise. Higher minimum equity allocation in strategy-based funds, clearer separation of categories, and tighter overlap limits all push AMCs towards one outcome: a scheme must look like what it claims to be.

The discontinuation of solution-oriented funds may inconvenience investors who liked the clarity of a goal tag, but the goal itself doesn't go away. It can still be pursued through the right mix of equity, debt, and hybrids based on time horizon and risk appetite.

The one change most relevant for retail investors is the introduction of life cycle funds. For those who struggle with rebalancing, these funds could offer a promising structure. But when launched, they will be new and untested across market cycles. Thus, their outcomes will depend on execution, how intelligently AMCs design glide paths within the permitted ranges, and how smoothly asset allocation shifts in real-world conditions.

The only way to actually LOSE MONEY on your SIP

By Pranit Mathur

Imagine checking your mutual fund app on a Sunday morning, coffee in hand, fully expecting to feel good about yourself. And why not? You had done everything right. Three years ago, you started a SIP in a broad-based index, ignored every stray tip, and made contributions every single month without fail. And for a while, the discipline paid off. At the end of year one, your XIRR, the return metric that measures what every rupee of your SIP has actually earned, sat at a dizzying 40 per cent. At 18 months, still 39 per cent. Then the recent correction came.

By the second year, that 40 per cent had collapsed to 4. Not gradually but violently—a 35-percentage-point freefall in a market that had itself corrected only 18 per cent. Now, at the three-year mark, even after a partial recovery, the return is 9 per cent.

You might be puzzled. What did you do wrong to end up worse off than even the market? Nothing, as it turns out. The reason your returns look battered is not bad investing but simply the mathematics of how a young portfolio behaves.

Why early years make your SIP returns look bad

The wild swings in the XIRR are not signs of failure. They are the natural result of doing SIPs in the early stages. In the first few years, the invested corpus is still small. Each new monthly instalment makes up a large share of the total portfolio. Because of this, recent market movements dominate the calculation of returns. When markets rise sharply, the XIRR climbs to flattering levels. When markets correct, it drops just as sharply—or more.

Think of it this way. SIPs are a series of separate purchases made monthly. Each instalment is its own purchase, made at whatever price the market offers that month.

When markets fall, it is only the most recent instalments, bought at higher prices before the decline, that end up underwater. Not the entire portfolio. The earlier ones, purchased when prices were lower, still sit in positive territory. In other words, a correction hurts only the recent instalments, and actually helps the ones yet to come by lowering the purchase price.

So a bruised XIRR is not evidence that the portfolio has underperformed the market. It is simply evidence that the portfolio is young and has not yet reached the stage where it can absorb volatility. That stage comes later. And it occurs when something important shifts in the portfolio's makeup.

The early years of SIPs are a rollercoaster

The XIRR of a three-year SIP can swing from euphoric highs to alarming lows

Based on monthly SIP invested at the beginning of each month from March 1, 2023, to February 28, 2026, in BSE 500 TRI. End-of-month values are considered for returns.

What tames wild returns

What changes over time is the balance between the money you invest and the money the portfolio generates. In the early years, most of the portfolio consists of your contributions. The gains are small relative to what you keep adding. Over time, the equation shifts. The portfolio grows large enough that its gains begin to rival, and eventually exceed, the monthly investments.

We call that shift the crossover point. For this analysis, we define it as the moment when the portfolio reaches roughly twice the total amount invested—that is, when accumulated gains equal total contributions. This is our analytical threshold, not a universal standard, but it serves as a useful marker for when the portfolio starts to develop its own momentum and becomes more growth-driven than contribution-driven.

After the crossover, volatility feels less severe. Compounding becomes visible in a more durable way.

So if your SIP returns look erratic in the first few years, that is simply how XIRR behaves in the early stages, driven by prevailing market conditions. The portfolio starts to absorb corrections better only after it has substantially outgrown the money put into it. The question then becomes: how long does that take?

How long does it take for compounding to show results

Under textbook conditions, a steady 12 per cent annual return, roughly the long-term Indian market average, a ₹10,000 monthly SIP reaches crossover at around year 12. But markets do not deliver steady returns. A 12 per cent return sustained for 12 years is a spreadsheet assumption, not reality.

So we turned to the Sensex, which, since 1979, has lived through booms, crashes, geopolitical shocks, policy upheavals, and full economic cycles. That 45-year history allows us to test how compounding unfolds in the messy conditions of real markets, not on a spreadsheet.

We tracked investors who began monthly SIPs in the Sensex at different starting points, from 1980 onward, spaced five years apart. Each entered the market under different conditions. Some started just before powerful bull runs. Others began at the start of prolonged periods of weak returns. The differences in their journeys were stark.

The fastest investor reached crossover in just 2.1 years, powered by one of the strongest bull markets in Indian history. The slowest took 11 years, having started in a period where market returns stayed well below average for an extended stretch. Thus, across four decades, the time to crossover ranged from 2 to 11 years. See table: How market cycles affect time to reach crossover.

The reason for this range is straightforward. When markets surge in the early years, the portfolio swells quickly, and gains overpower contributions sooner. When markets are weak early on, the young corpus takes much longer to build enough strength for compounding to take hold.

How market cycles affect time to reach crossover

SIPs starting in different years reached crossover at very different speeds

Starting year	Years taken to reach crossover point	Return at crossover point (% p.a.)	Return 5 years after crossover point (% p.a.)
1980	5.4	26.0	18.6
1985	5.6	25.9	25.1
1990	2.1	83.8	14.8
1995	10.6	12.6	15.1
2000	5.7	24.6	20.3
2005	2.8	55.2	9.1
2010	11.0	12.1	11.6
2015	9.5	14.2	11.0

Based on monthly SIPs in Sensex. For periods, where 5 years after crossover hadn't elapsed, data till March 4, 2026, was considered.

The early years determine the length of the journey. But they do not change the destination. Every single investor in our dataset eventually crossed the point where portfolio growth began to dominate fresh contributions. Those who started in strong markets arrived quickly. Those who started in difficult markets waited much longer. But every one of them arrived.

That is one reassurance from this exercise. The timing of crossover varies enormously depending on what the market does in your early years. But it always comes. This also raises a question: if your portfolio reaches crossover faster, are you better off? Not necessarily.

The mirage of arriving early

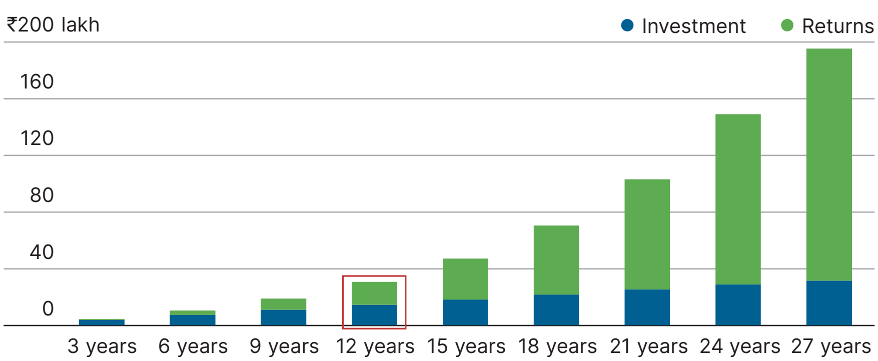
Consider the most appealing number in the earlier table: 2.1 years. That is how quickly the 1990 investor reached crossover, with an extraordinary annualised return of almost 84 per cent. This may look like compounding at remarkable speed, but it was not.

These returns were the product of a market that had become irrationally overvalued in a short period. The crossover was not earned through patient accumulation. It was driven by temporary, unsustainable gains.

When the bubble burst, the gains that had powered the early crossover evaporated. The portfolio fell back to roughly the level of total contributions. For years afterwards, it was simply trying to recover ground that had vanished. It did not sustainably outgrow its investments again until around 2004, roughly 14 years after the SIP began. See table:

How compounding works in a perfect world

At 12% annual return, a monthly SIP reaches crossover in about 12 years



Based on monthly SIPs of ₹10,000 made at the beginning of each month yielding an assumed 12 per cent per annum.

An early crossover that didn't last.

The pattern is clear: while sharp early returns may bring crossover quickly, they rarely last. And even if you start out ahead by luck, markets eventually normalise. Over long periods, the returns settle into a range not dramatically different from that of someone who arrived at the crossover later, but more steadily.

A similar contrast appears across fund categories. Small-cap portfolios often reach crossover sooner, but the journey is far more volatile. Large- and flexi-cap portfolios typically take longer and experience fewer severe swings along the way. See table: Where you invest shapes what you get.

Speed is not necessarily an advantage. Fast crossovers often ride on fragile gains and high volatility. Slower ones, built through steady accumulation across market cycles, tend to produce portfolios that hold up better when markets eventually turn rough.

Time makes portfolios tougher

Once a portfolio matures beyond crossover sustainably, market crashes stop rewriting its return history. That resilience is the accumulated result of years of compounding, building a cushion underneath the portfolio.

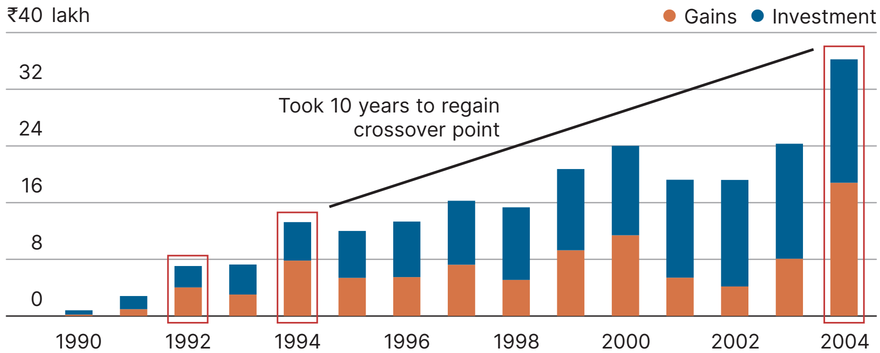
The table—Older SIP portfolios hold up better in crisis—examines seven major corrections since 2000, each involving a decline of over 20 per cent in the BSE 500. For each episode, it shows what the SIP return (XIRR) in an average flexi-cap fund looked like at the market bottom for portfolios of different ages.

During the 2008 crisis, the one-year-old portfolio was down nearly 52 per cent per annum at the bottom. A three-year-old corpus was also deep in the red, at minus 26 per cent per annum. But a seven-year-old portfolio was still in positive territory at 11.5 per cent annual return. A 10-year-old portfolio was up 14.4 per cent per annum.

These numbers, without context, would not suggest any crash had occurred. The same market event, the same index correction, yet investors sitting 10 years apart in their SIP journey experienced it in

An early crossover that didn't last

The 1990 SIP crossed over in two years but quickly lost momentum



Based on monthly SIPs in Sensex from January 1990.

Where you invest shapes what you get

One 2010 investor, multiple categories, dramatically different endings

Categories	Years taken to reach crossover point	SIP return (% p.a.)	Worst fall (%)	2nd worst fall (%)	3rd worst fall (%)
Large cap	11.1	11.3	-36.7	-17.7	-17.6
Mid cap	5.1	15.5	-36.1	-21.8	-20.9
Small cap	4.9	15.3	-43.5	-25.5	-24.8
Flexi cap	8.0	12.1	-36.0	-19.5	-18.9
Aggressive hybrid	11.4	11.0	-29.3	-14.8	-10.2

Based on the regular plan of an average fund in the category, as per VR classification. Fall refers to a decline in portfolio value from its peak. Data from January 1, 2010 to March 6, 2026 considered.

completely different ways.

The reason is simple. Young portfolios, dominated by recent contributions, suffer sharply every fall. Older portfolios carry years of accumulated gains and units bought across multiple cycles. Those earlier units sit on substantial profits, giving the portfolio a cushion that younger ones simply do not have.

This pattern also holds throughout the last 25 years of the market. A continuous SIP in the Sensex from 2000 to 2026 shows that early returns swung wildly as each market cycle reshaped the portfolio. But as the corpus aged, those swings narrowed. By the 2010s, the return settled into a steady band around 13–14 per cent, largely unmoved by corrections that sent younger portfolios into freefall.

This is what staying invested actually produces. Not a straight line upward, but a gradual, irreversible calming.

The price of leaving

Mature portfolios absorb shocks far more easily. But knowing this in hindsight and living through a crash in real time are different experiences. An investor with a three-year SIP during the 2008 crash saw their portfolio decline by 26 per cent. At that moment, the instinct to move to safety is strong. Some investors did exactly that. How did their outcome differ from someone who stayed?

We compared two identical investors. Both began with the same SIP in a flexi-cap fund. Both experienced the same crash. The only difference is what they did at the bottom.

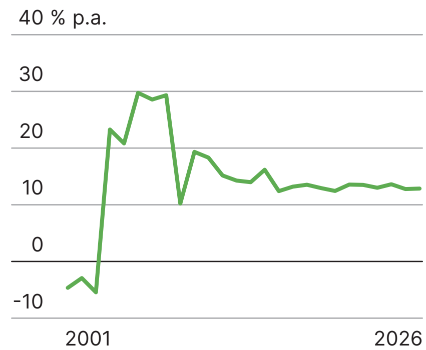
Investor A stayed invested and continued the SIP in equity. Investor B switched the entire portfolio to a short-duration debt fund in March 2009 and directed all future SIPs there. From that moment, the two portfolios began to diverge.

By March 2026, A's portfolio had grown to about ₹94 lakh. B's portfolio reached roughly ₹45 lakh. The gap is approximately ₹50 lakh. **An important caveat:** this comparison does not account for tax implications at the time of switching. Exit loads and capital gains tax on the equity-to-debt transfer would reduce B's corpus further at the point of switch, while also reducing the headline gap somewhat, depending on the investor's tax bracket. The conclusion that leaving equity at a market bottom is extremely costly holds firmly. But the precise ₹50 lakh figure should be read as indicative, not exact.

The larger point remains. March 2009, when B made their exit, was not just another market low. It

Time in market stabilises your portfolio

XIRR returns swing widely in early years of an SIP before gradually settling down



Based on monthly SIPs made at the beginning of each month in Sensex from March 01, 2000 to February 18, 2026.

Older SIP portfolios hold up better in crisis

Years of accumulated gains help older portfolios cushion market declines

		SIP return at crash (% p.a.)						
Crash (%)	Crash name	1 year	3 years	5 years	7 years	10 years	15 years	20 years
-67.7	Dot com bubble - 2001	-47.5	-11.7	11.8	–	–	–	–
-29.2	2004 crash	22.7	36.4	20.9	26.0	–	–	–
-32.6	Macro driven crash - 2006	-11.1	30.0	37.6	28.5	30.0	–	–
-66.4	2008 GFC	-51.8	-26.0	-4.0	11.5	14.4	–	–
-20.9	Correction due to overvaluation - 2016	-25.1	6.3	9.8	10.1	10.1	17.1	19.3
-38.4	Covid-19 crash - 2020	-52.7	-20.9	-8.7	-1.4	3.2	6.8	12.6
-19.0	Current correction* - 2025	-18.8	8.5	12.6	12.3	11.6	12.3	12.4

Corrections of over 20 per cent in the BSE 500 since 2000 are included. *Though the current correction does not qualify the criteria, it has been included for context. Based on monthly SIPs in the regular plan of an average flexi cap fund. "–" indicates insufficient fund history.

became the starting point of one of the strongest equity rallies in Indian market history. Every rupee that left equity at that moment missed the subsequent recovery. Market bottoms are rarely recognisable in real time. But they are almost always the moment when the next phase of growth quietly begins.

The longer you stay, the more certain the outcome

If leaving early is costly, what does patience actually deliver? We examined daily rolling SIP returns of an average flexi-cap fund—starting from every possible date between October 1996 and March 2026—for different holding periods. The pattern changes dramatically as the investment horizon lengthens.

At one year, the results are chaotic. About 25 per cent of one-year SIPs delivered losses. Meanwhile, 47 per cent produced returns above 20 per cent. Almost any outcome between those extremes was possible. Over such a short period, an SIP behaves less like a strategy and more like a coin toss.

At three years, the picture improves, but uncertainty remains. Losses still occur in 9.2 per cent of cases, and the spread of outcomes is still wide.

At 10 years, the picture transforms. In every 10-year SIP window we tested, not a single one delivered a loss. The distribution of returns begins to concentrate in higher bands. The probability of earning between 10 and 20 per cent per year rises sharply, accounting for two-thirds of all outcomes. **At 15 years**, that figure reaches 72 per cent. **At 20 years**, it rises to around 84 per cent.

Time does two things. It steadily increases the likelihood of higher returns. And it compresses the range of possible outcomes. Short horizons produce wildly different results. Long horizons narrow those possibilities into a far more predictable band.

Luck matters a great deal in the first few years. Given enough time, it matters far less. The only real challenge is surviving the early years—the volatile returns, the market corrections, and the numbers that look worse than they are—before compounding has had enough time to take hold.

The odds of strong returns rise with time

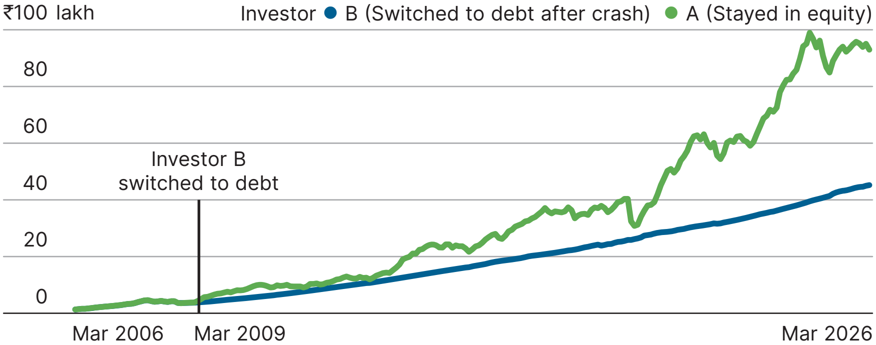
Higher return bands become far more likely over longer horizons

	Probabilities (%)						
SIP return buckets	1 year	3 years	5 years	7 years	10 years	15 years	20 years
Less than 0% p.a.	25.4	9.2	1.1	0.1	0.0	0.0	0.0
0 - 5% p.a.	8.1	9.4	3.8	1.2	0.2	0.0	0.0
5 - 10% p.a.	8.7	11.9	15.7	11.9	3.1	2.6	0.0
10 - 20% p.a.	10.5	31.3	48.0	57.3	66.4	72.3	83.7
More than 20% p.a.	47.2	38.2	31.4	29.5	30.3	25.2	16.3

SIP in the regular plan of an average flexi cap considered. Based on data from Oct 24, 1996 to Mar 4, 2026.

Switching exacts a heavy cost

Exiting equity at the 2009 market bottom left one investor poorer by almost ₹50 lakh



Based on monthly SIPs made in the regular plan of an average flexi-cap fund. Switching is done at the trough of the market correction on March 9, 2009. Fresh SIPs are shifted towards the regular plan of an average short-duration debt fund. No tax implications have been considered at the time of switching.

The view from the other side

Return to the beginning of this story. Three years in, that SIP return of 9 per cent which, not long ago, was 39 per cent looks like a failure.

But the fall has actually done something good. The correction that crushed the XIRR also lowered the average cost of units in your portfolio. Every monthly instalment during the downturn bought more units at lower prices. Since these units were added at prices lower than where the market stands today, they are already in profit and have more room to run. In effect, the portfolio is better positioned for the next sustained rally than it was at 39 per cent.

Over time, the portfolio will grow. The share of the corpus made up of fresh contributions will shrink. The gains generated by earlier investments will begin to dominate. When that shift happens, market swings that once shook the XIRR will matter progressively less. Returns will settle into a narrow, predictable band. Not because you did anything extraordinary, but because you gave the process enough time.

The data from 45 years of Indian market history says the same thing, in every way we tested it: the only investors who permanently lost money on their SIPs were the ones who stopped.

The best upgrade to your SIP costs nothing but discipline

If time and discipline are the engines of compounding, can an investor do anything beyond staying invested to improve outcomes? There is one simple method: increase the SIP amount gradually as income grows.

This is called a step-up SIP. The monthly contribution rises by a fixed percentage every year. As earnings increase, investments keep pace.

You might expect that step-up SIPs delay the crossover point, since larger investments should need larger gains to reach the 2x threshold. Surprisingly, that does not happen.

Across almost every starting-year cohort, step-up SIPs and flat SIPs reach crossover in nearly identical timeframes. Long-run returns at the 20-year mark are similarly close, diverging by only a percentage point or two in most cases.

What differs dramatically is the final corpus. The investor who began in 1980 and increased their SIP by 10 per cent every year ended with roughly ₹3.9 crore after two decades. The one who kept contributions unchanged reached about ₹2.4 crore—a difference of ₹1.5 crore. The reason is straightforward: steadily increasing contributions allow more capital to enter the compounding process. It does not change the rate of compounding. It gives compounding more money to work with.

A note on the 2005 exception: In that cohort, the flat SIP investor reached crossover in 2.8 years while the step-up investor took 13.6 years. This is a mathematical edge case. At the moment the flat SIP achieved crossover, the step-up SIP's gains were approximately 96 per cent of contributions—very close to the threshold. But the 2008 crash erased those gains before they could cross over, pushing the step-up SIP's formal crossover date out to when the flat SIP was re-achieving it after the same crash. ☑

The best upgrade to your SIP

Step-up SIPs match flat SIP returns and crossover time while building nearly double the portfolio

SIP start year	Years taken to reach crossover point		Return at crossover point (% p.a.)		Value after 20 years of SIP (₹ cr)		Return after 20 years of SIP (% p.a.)	
	Step-up	SIP	Step-up	SIP	Step-up	SIP	Step-up	SIP
1980	5.4	5.4	29.2	26.0	3.9	2.4	19.3	19.7
1985	5.6	5.6	27.7	25.9	2.2	1.2	13.7	14.2
1990	2.1	2.1	84.5	83.8	2.6	1.2	15.2	14.5
1995	10.7	10.6	14.8	12.6	2.3	1.1	14.2	13.7
2000	5.7	5.7	26.6	24.6	2.0	1.1	12.7	13.2
2005	13.6	2.8	11.8	55.2	1.9	0.9	12.2	11.9

Based on a monthly SIP of ₹10,000 invested at the beginning of each month in the Sensex. Step-up scenario assumes a 10 per cent annual increment. The crossover point is defined as the moment when accumulated gains exceed total contributions.

INTERVIEW

Investing isn't mathematics, it's judgement

Bharat Shah,
in conversation with **Dhirendra Kumar**

I recently had the opportunity to spend nearly three uninterrupted hours speaking with Bharat Shah, one of India's most thoughtful investors. The co-founder of one of India's most respected portfolio management firms, Shah has spent three decades doing what few investors manage: building a reputation not on returns alone, but on the rigour of his thinking.

The conversation ranged widely, from valuation and business quality to the deeper psychology of investing. Shah returns repeatedly to first principles: judgement over formulas, discipline over fashion and the courage to stand apart. What follows is an excerpt of that wide-ranging discussion.

You were a topper in school, then a top-ranking CA and cost accountant, followed by an MBA. After working for a while, you moved into investing. What drew you to investing so early?

My baptism into investing happened much earlier, during college. I felt an instinctive pull towards understanding businesses and how they worked. The irony was that I had no money to invest. I came from a modest background, so investing was a luxury I couldn't afford. But curiosity pushed me forward. I would go to scrap dealers and buy annual reports by the kilo. Those reports became my first real course in investing.

Books on investing were expensive then, especially the good ones from the US, so I learnt directly from companies instead of frameworks. Reading annual reports fed my curiosity and deepened my appetite for understanding businesses. Over time, I realised that investing is fundamentally about managing risk intelligently. It is not a deterministic exercise; it is a game of probabilities.

What fascinated me was its dynamism. Investing forces you to think about the future, something we are not naturally wired to do. At its core, it is about paying X today in the hope of receiving X plus Y over time. That means postponing gratification and living with uncertainty.

People often think investing is about numbers and precision, but the precision is largely an illusion. Mathematics helps structure judgement, but the real challenge is forming that judgement about the future. If you play the game well, wealth becomes a by-product.

For me, even in those early days when I had no capital to deploy, the joy was in the learning and the process of digging deep into businesses.

You often say 'quality' is not a slogan. What do you mean by that?

Quality is not a fetish. It is not a shibboleth. It is not something you adopt because it sounds good on a slide.

Quality is the innard of a good investment. It is what gives a business resilience against change and against the vicissitudes of the environment. Without quality, businesses become casualties of change, and change today is violent, multifarious and constant.

Resilience matters for two reasons. First, it gives longevity. Anything that will prevail longer is more valuable today. A business likely to endure for 30 years is more valuable than one likely to endure for 10, all else equal.

Second, quality gives you the psychological advantage to remain invested for the long term, not because "long term" sounds good, but because you believe the business can ride through storms. Long-term investing is what allows compounding to work, unless the economics are permanently impaired or the business is damaged beyond repair. Bad weather is not a storm, and even a storm passes.

“People often think investing is about numbers and precision, but the precision is largely an illusion. Mathematics helps structure judgement, but the real challenge is forming that judgement about the future.”

Quality is also mathematical. Return on capital employed is not only a number, it is an idea. A business needs capital, it generates a return on that capital. Higher and sustained returns suggest the business is doing something right.

Every business has a cost of capital. Your own equity has an implicit cost. Borrowed capital has an explicit cost. Value creation is the difference between the return you earn and the cost you pay.

The value of a business today is the discounted value of future economic value added, adjusted for time value of money and risk. Quality sits at the heart of this equation. It is not a display item. It is core.

Third, quality enables growth. In financial businesses it is very clear, but it applies elsewhere too. If return on equity is poor, high growth is not sustainable. Money is the raw material. If returns are low, growth beyond that requires capital injection, which creates dilution. Quality acts like a gravitational force. Inferior quality creates high friction against growth. Superior quality reduces friction and allows growth to translate into cash flows.

So quality is the economics and the psychology of investing, and in some sense even its spiritual core.

How do you define a reasonable price? You've said P/E is a poor way to compute value. Why?
First, P/E compares today's price to near-term earnings, six months, one year, two years. But the value of a business is the value of its entire life, not a small slice of forecasted future.

Second, P/E compares price to profit. Profit is an incomplete description. Cash flow is the complete description. Profits can be suppressed, inflated or managed. Cash is harder to fake.

Third, P/E does not incorporate time value of money. Profit 10 years from now is not the same as profit next year. Without time value of money, you can't arrive at value.

Fourth, P/E ignores capital efficiency and business quality, return on capital employed and the factors that determine durability, predictability and resilience. Valuation is not a single number. It is context.

The game is probabilistic. Value is a probabilistic judgement about how cash flows and business characteristics will play out over time. If you do it well, you will still be wrong sometimes, but you will get enough right. A 65 to 75 per cent hit rate is more than enough. The problem starts when we try to force this into false precision, and which is why P/E is such a poor, but unfortunately very popular description of value.

Take China's market P/E and India's market P/E over a 30-year period. India's P/E is higher through most of the period. If P/E were a reliable predictor, one would assume China is the obvious bet. Yet India delivered far higher dollar returns over those 30 years. The "cheap" market underperformed despite staying cheaper. That should tell you something about the limitations of a single-number framework.

You've said exclusion is central to investing, what you choose not to do matters. What makes you walk away from something that looks brilliant?
Exclusion works at two levels. One, you apply it to each filter. Two, you apply it to the totality. If you have 10 filters and a business scores well on six, that is not enough. It must be acceptable on all. Not the best on every parameter, but it must clear the bar on each, opportunity size, growth rate, quality of growth, durability, management character, balance sheet strength and so on.

The reality is that out of 100 businesses, 90 to 95 will fail to create adequate value over time. Similarly, out of 100 management teams, perhaps only three to five are worth serious attention. And when you combine quality of business and quality of management, this is multiplicative, not additive. That is why exclusion is so powerful. Human psychology craves congregation. It gives comfort. Investing demands the ability to stand alone, without wavering, without arrogance, but with the confidence that you have done the work and that the world can still be wrong.

Investing is not a democracy. Democracy belongs to society and politics. It doesn't belong to investing.

You don't invest in profitless companies. In India, many loss-making companies have enormous market caps today. What does that tell you about where we are in the cycle?
The rule of investing has not changed over

centuries. The core equation remains.

On the left-hand side is the price you pay for one share. On the right-hand side is the stream of future profits over the life of the business. We refine that to cash flows, then to net cash flows, and then to discounted net cash flows adjusted for time value of money and risk.

That equation does not change. Price is a given. The right-hand side requires imagination, how long, how much, what converts to cash, what discount rate is appropriate. If cash flows are not there today, they must be there tomorrow. If losses exist, they must be offset by higher future cash flows, after discounting. If the business never generates profits, it has no value. If it generates some profits but not enough to justify the price paid, value is impaired. If it converts losses into very large future cash flows, it can still be a great investment.

But the equation is inescapable. What changes from time to time is crowd psychology, enthusiasm and exaggerated beliefs about the future. When those beliefs are punctured, the outcome is punctured too.

How do you avoid selling too early? Is there a temperament practice or a checklist?

There is a mathematical rule and there is an investment precept.The mathematical rule is to operate with a margin of safety. As we discussed, there are three sources of return.

One, future growth in cash flows, an annuity. Two, quality of that growth, another annuity. Three, margin of safety, a one-time kicker, because price eventually converges to value.

When price equals value, the margin of safety is gone. After that, you are left with growth and quality. When price goes above value, you enter a margin of hazard, and that hazard reduces future returns. At some point you must decide what return is acceptable relative to alternatives.

The difficult part is what I described earlier. You buy a great business at a big margin of safety. Growth exceeds expectations. Quality improves. Operating leverage kicks in. The whole equation becomes a force multiplier, and price runs up rapidly. Eventually price closes in on value and then exceeds it, and yet you remain holding.

The first time price exceeds value is the first signal to watch. But a great business becomes a loved business. You start owning it and loving it more than you should. If the excess of price over value is reasonable, you can live with it and accept lower future returns.

But you still need a cutoff. If something that once offered a 20 per cent expected return now offers eight, you must decide whether that works. The pressure is psychological. You are selling a trophy asset. It has worked brilliantly. It has massaged your ego. Letting go pulls you out of your safety zone and into dissonance. That is where internal discipline matters.

Is there any disclosure you actively look for today that wasn't available earlier?

The only disclosure I really look forward to is cash flow. Everything else is English, and English can be dressed up however the author wants. It can sound like a symphony or poetry or an epic, but it is still the management's narrative.

“The rule of investing has not changed over centuries. The core equation remains. On the left-hand side is the price you pay for one share. On the right-hand side is the stream of future profits over the life of the business.”

I want to read what management says. I want to understand what they want us to believe. But I don't want to form my opinion from their words. I prefer to observe the innards of the business and draw conclusions from independent facts about the business, the industry and even critics, not only friendly sources.

There is value in meeting management periodically, but meeting them too often exposes you to unnecessary influence. Benjamin Graham's approach was that you don't need to meet them, and there is intellectual merit in that. At the same time, some visionary beliefs can only be understood by listening to the person who holds that belief. It could be right or wrong, but you learn by listening to inspired entrepreneurs. So I don't deny myself that, I only try to avoid overexposure. ☑

I sat with Bharat Shah for nearly three hours and was barely interrupted. Every sentence carried the weight of decades of investing wisdom. This was just a glimpse; the full masterclass is coming soon.

Still rewarding, but no longer easy

After the broad rally, wider dispersion makes fund selection crucial

Mid- and small-cap funds operate in a part of the market where the upside is larger, but so is the room for error.

Mid-cap funds invest in companies ranked 101st to 250th by market value, while small-cap funds go further down the market-cap ladder beyond the top 250. These are businesses still scaling up. Market positions are less settled and stock prices react more sharply to both promise and disappointment.

That makes these funds rewarding over long periods, but far less forgiving along the way. For investors, the trade-off is clear: stronger long-term potential, but a much bumpier ride.

Key trends

Performance: The tone of the market has changed meaningfully over the past few years.

The broad rally that lifted much of the mid- and small-cap universe in 2023 gave way to a tougher environment in 2025. Mid caps proved relatively more resilient, while small caps weakened more sharply.

Returns are no longer easy or evenly distributed. That turbulence appears to have carried into 2026 as well.

Fund selection matters more again: A softer market phase makes the gap between funds far more visible.

In the mid-cap category, one-year returns as of January 31, 2026 range from 16 per cent for the best performer to -9 per cent for the weakest.

Small-cap funds show a similarly wide spread of over 16 percentage points.

This dispersion is an important reminder that in this segment, portfolio construction and a fund manager's ability to navigate volatility can materially influence outcomes.

Investor appetite outlasts the rally: Flows into mid- and small-cap funds stayed strong even after the broad rally had cooled. Combined inflows peaked in 2025 and remained close to ₹8,000 crore in February 2026, indicating that investor appetite had not faded despite returns. Even as performance became harder to achieve and more uneven across funds, investors continued to commit meaningful capital to the category and remained engaged with it.

Category snapshot

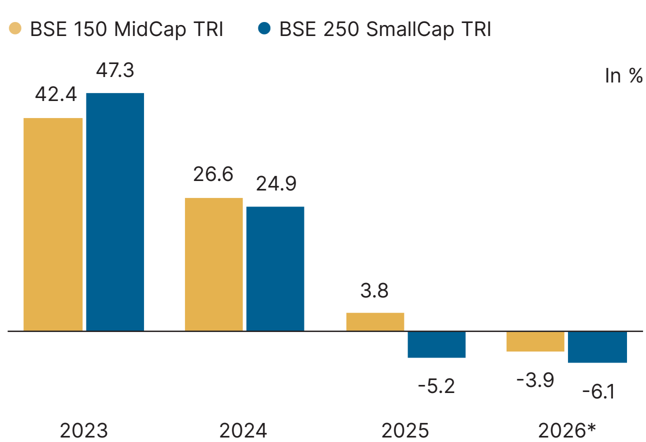
Key metrics of mid- and small-cap fund categories at a glance

Parameter	Mid cap	Small cap
Total number of actively-managed funds	32	34
Total assets managed (₹ lakh crore)	4.50	3.56
Asset-weighted expense (%)	0.68	0.66
Asset-weighted category returns (%)	8.69	1.19
Average return of top quartile funds (%)	13.35	6.68
Average return of bottom quartile funds (%)	0.25	-4.28
Average large-cap exposure (%)	12.02	4.91
Average mid-cap exposure (%)	72.20	14.40
Average small-cap exposure (%)	15.78	80.80

Returns are based on one-year data as of January 31, 2026.
All other data as of January 31, 2026.

Back from the stratosphere

Mid- and small-cap returns weakened after 2023 rally



*As of January 31, 2026.

Baroda BNP PARIBAS MUTUAL FUND

A Multi Asset portfolio for your wealth

...is like a wholesome meal for your health

Baroda BNP Paribas Multi Asset Fund

(An open ended scheme investing in Equity, Debt and Gold ETF)

Convenience

Access to multiple asset classes saves the hassle of investing and tracking investments in multiple strategies.

Diversification

Offers lower risk by spreading investment across asset classes.

Optimal Risk adjusted Returns

Different asset classes with varying returns and risks, has potential to provide optimal risk adjusted returns.

Our top picks
Mid-cap funds

Edelweiss Mid Cap ★★★★★

- Bettered its average peer in seven of the past 10 calendar years through selective exposure to reasonably priced growth stocks.
- Strong stock selection has helped it outperform both the benchmark and its peers consistently.
- Its portfolio reflects a clear quality-focused style and high conviction in business selection.

Kotak Midcap ★★★★

- The fund focuses on reasonably priced, growth-oriented businesses, often with a tilt towards larger mid-cap companies.
- With a one-year return of over 17 per cent (as of March 11, 2026), around five percentage points ahead of the BSE 150 benchmark, it has stood out over the past year.
- Its portfolio has also held up relatively better during weaker markets, making it a steadier option in a volatile segment.

WhiteOak Capital Mid Cap ★★★★★

- The fund has delivered one of the highest alphas in the category over three years, beating the index by 4 per cent.
- Its portfolio of roughly 120 stocks combines established mid caps with smaller emerging names, providing both stability and future growth potential.

Our top picks
Small-cap funds

Bandhan Small Cap ★★★★★

- The fund remained in the top quartile through 2023, 2024 and 2025.
- It has delivered higher returns than most peers, though with higher volatility.
- With AUM more than doubling from ₹8,475 crore in February 2025 to ₹20,474 crore in February 2026, the fund expanded to 245 stocks, its highest stock count since 2020.

HDFC Small Cap ★★★★

- The fund improved sharply from the fourth quartile in 2024 to the top quartile in 2025.
- Its value-conscious approach has helped it outperform both benchmark and peers over longer periods.
- It has also held up relatively well on the downside, an important trait in small caps.

Invesco India Smallcap ★★★★★

- The fund has generated a 7 per cent alpha over the past three years, making it one of the stronger recent performers.
- Its portfolio is more tactical and concentrated than many peers, with about one-third of assets in the top 10 holdings. ☑

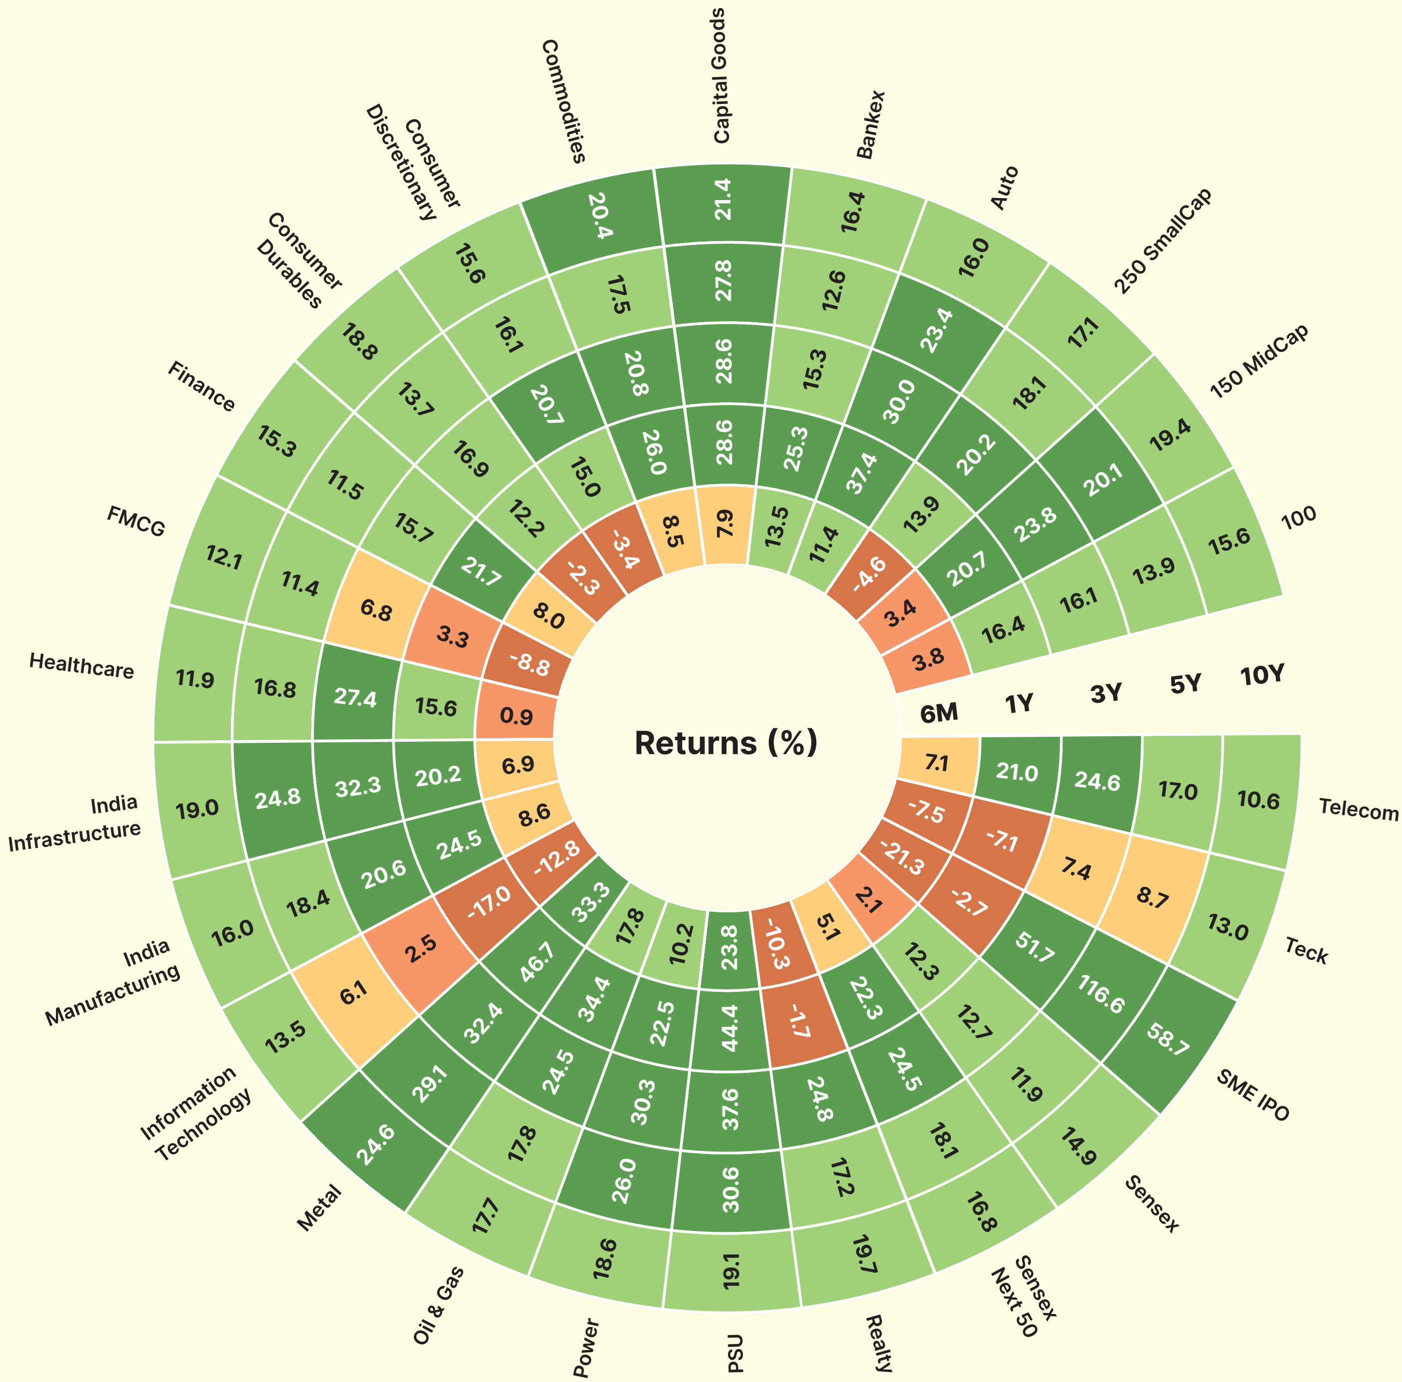
THE INDEX INVESTOR

Tech missed the memo

Even as broader indices hold firm, the technology sector is showing signs of strain



Data as of February 27, 2026 for BSE indices. Total Return Index (TRI) considered for all indices. Returns of over a year have been annualised.

The passive flexi-cap play

Let's unpack the Nifty 500 Flexicap Quality 30 index

Index snapshot

Parameter	Details
Launch date	April 4, 2025
About the Index	Tracks 30 quality stocks selected from large-, mid- and small-cap universes, with 10 stocks drawn from each segment based on six-month average free-float market capitalisation.
Largest / smallest company (market cap, in ₹)	TCS (11.3 lakh crore) / Indian Energy Exchange (11,307 crore)
Median market capitalisation	₹79,105 cr
Top sectors by weight	IT (29.2%), FMCG (24.1%), Capital Goods (12.3%)

Source: NSE Factsheet. Market cap data as of January 31, 2026.

True to its label

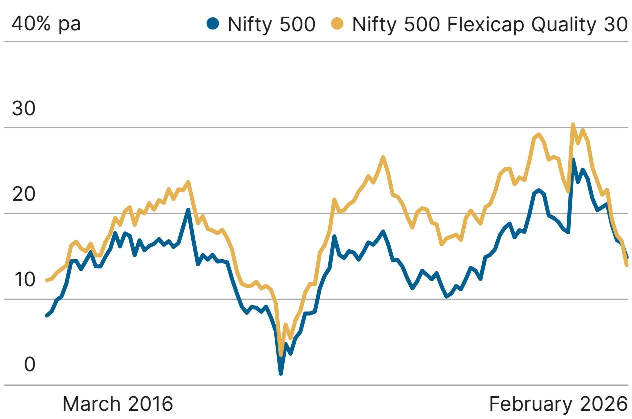
The index shows stronger quality metrics than the Nifty 500 and the average flexi-cap fund

Metric	Nifty 500 Flexicap Quality 30	Nifty 500	Average flexi-cap fund
D/E	0.04	0.76	0.78
ROE - 5Y avg. (%)	24.68	16.64	15.11
ROCE - 5Y avg. (%)	31.82	16.86	15.07
Quality Score (Out of 10)	9.19	7.04	6.94

D/E (debt/equity), ROE and ROCE data on a TTM basis as of March 6, 2026. Quality Score as per Value Research Stock Rating as of January 31, 2026.

A quality advantage

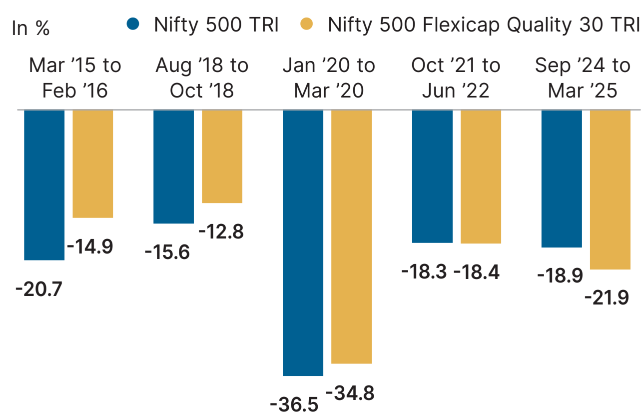
Across 5-year periods, the index has majorly outperformed its parent



Data as of February 28, 2026. Total Return Index (TRI) considered.

Quality protection during corrections

In recent corrections, the index has fallen less than the Nifty 500



Periods when Nifty 500 TRI fell at least 15 per cent since 2015 are considered.

Final verdict

The Nifty 500 Flexicap Quality 30 Index brings together high-quality companies from across large-, mid- and small-cap segments, and this has translated into a strong performance record on paper. Over the past decade, its five-year rolling returns have averaged more than 19 per cent per annum, compared with around 15 per cent per annum for the Nifty 500. During recent corrections, the index has fallen less than the broader benchmark, although the difference has generally not been very large.

It is also important to note that these numbers are based on back-tested data, which may not always reflect future performance.

THE INDEX INVESTOR

Nitin Yadav/AI-generated Image

The index isn't the market

Why market-cap weighting hides the deeper damage during corrections

Market corrections often confuse investors. You open the financial news and see the index down around 15-20 per cent from its peak. Uncomfortable, yes, but hardly catastrophic.

Then you open your portfolio. Many stocks are down 30 per cent. Some 40 per cent. A few look like they have fallen off a cliff.

This raises an interesting question: if the index is down only 15-20 per cent, why are so many stocks falling much more? The answer lies in something most investors rarely think about, how stock market indices are constructed.

Beneath the surface

Popular indices such as the BSE 500 often mask what is really happening beneath the surface of the market.

As we move down the market-cap ladder, a larger share of stocks tends to fall sharply during corrections compared with the largest companies.

To illustrate this, we examined periods since 2018 when the BSE 500 fell more than 15 per cent from its peak. The 500 stocks were divided into four groups based on market capitalisation: 1-50, 51-100, 101-250 (mid caps) and 251-500 (small caps).

While stocks ranked 1-100 together broadly represent the large-cap universe, we split them further to highlight the outsized influence of the top 50 companies on the index.

We then analysed how many stocks in each bucket fell by more than 30 per cent during these market correction periods.

The pattern is clear. During the Covid-led correction between January and March 2020, the index fell about 38 per cent. Yet within the index, roughly 360 stocks had fallen more than 30 per cent.

And the deeper we move down the market-cap ladder,

Where the real damage happens

As we move down the market-cap ladder, the share of stocks with steep declines rises sharply

		Stocks falling more than 30% across ranks			
Period	Nifty 500 decline (%)	1 to 50	51 to 100	101 to 250	251 to 500
Aug '18 to Oct '18	-15.7	3	5	17	37
Jan '20 to Mar '20	-38.4	39	35	101	185
Oct '21 to Jun '22	-18.3	10	15	60	99
Sep '24 to Feb '25	-19.0	8	16	50	100

Stock rankings are based on market cap. Periods when the BSE 500 fell by more than 15 per cent from its peak from 2018 have been considered.

the sharper the damage becomes. Yet the headline index number often appears far less severe. To understand why, we need to examine how indices are constructed.

How indices are built

Indices such as the Nifty 500 are market-cap weighted. Larger companies carry much greater influence on the index's movement.

Think of it like a weighted average in school. If an external exam counts for 65 per cent of your final grade and an internal exam for 35 per cent, a poor internal score barely moves the final result compared with a poor external score.

The same logic applies to stock indices.

Just 50 companies account for around two-thirds of the entire index. The bottom 250 companies together account for just 7 per cent. So when smaller companies collapse during market corrections, they simply do not have enough weight to drag the index down with them. Large companies, typically more stable, dominate the headline number investors see.

The equal-weight test

Now imagine a version of the Nifty 500 where every stock carries the same weight, roughly 0.2 per cent each, whether it is a giant like Reliance or a relatively small company.

This is essentially how the Nifty 500 Equal Weight (EW) index works. In such a structure, smaller companies receive far greater representation. Stocks ranked 251-500 together account for nearly half the index, whereas in the regular Nifty 500 their combined weight is less than 10 per cent.

As a result, mid- and small-cap movements have a much stronger influence on the equal-weight index.

When we compare major drawdowns since 2018, the equal-weight version consistently falls more sharply than the regular Nifty 500. The reason is straightforward: by giving mid- and small-cap stocks a larger role, the index becomes far more sensitive to their steeper declines. There is no cushion from dominant large-cap stability.

This comparison is not meant to suggest that equal-weight indices are inferior. They have their own strengths and often perform well during strong bull markets.

The purpose here is simply to highlight how weight distribution alone can lead to different outcomes, even when both indices contain the same set of stocks.

In other words, a market-cap weighted index reflects the movement of the largest companies far more than the average stock.

The hidden advantage of indices

All this reveals something interesting about traditional market-cap weighted indices. They come with built-in stabilisers.

First, large companies dominate the weight, providing a strong anchor.

Second, those companies tend to fall less during market corrections, which helps moderate the overall market decline.

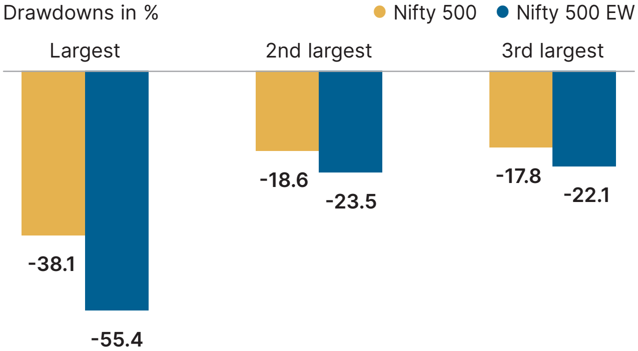
Third, indices still offer diversification across hundreds of companies, limiting the damage caused by any single stock collapse.

Put together, these features make indices naturally more resilient than many portfolios built around a handful of individual stocks.

This is one reason investors concentrated in mid- or small-cap stocks often experience sharper volatility than the broader market index. ☑

Equal weight, deeper fall

Equal-weight indices fall more in corrections because mid- and small-cap declines carry greater influence



Total Return Index (TRI) considered. Corrections include instances since 2018 when the index fell by at least 15 per cent from its peak.

A handful of stocks dominate the index

The top 50 companies account for nearly two-thirds of the BSE 500's total weight

Company rank	Weight in BSE 500 (%)
1-50 (Large caps)	64.0
51-100 (Large caps)	12.9
101-250 (Mid caps)	15.4
251-500 (Small caps)	7.7

Based on monthly averages over the past five years (ending January 2026). Stock rankings are based on market capitalisation.

Data as of February 28, 2026; portfolio-related data as of January 31, 2026. The scoreboard features the top 150 ETFs by AUM, excluding debt ETFs. Performance figures are based on market price, not NAV. Premium/(discount) shows the average difference between the ETF's price and NAV over the past year. Tracking error reflects how closely the ETF has matched its benchmark returns. Liquidity is indicated by an icon next to AUM, based on average daily trading volume (ADTV): ☺ High – above ₹1 crore | 😐 Moderate – ₹10 lakh to ₹1 crore | ☹ Low – below ₹10 lakh.

Data as of February 28, 2026; portfolio-related data as of January 31, 2026. The scoreboard features the top 150 ETFs by AUM, excluding debt ETFs. Performance figures are based on market price, not NAV. Premium/(discount) shows the average difference between the ETF's price and NAV over the past year. Tracking error reflects how closely the ETF has matched its benchmark returns. Liquidity is indicated by an icon next to AUM, based on average daily trading volume (ADTV): ☺ High – above ₹1 crore | 😐 Moderate – ₹10 lakh to ₹1 crore | ☹ Low – below ₹10 lakh.

Data as of February 28, 2026; portfolio-related data as of January 31, 2026. The scoreboard features the top 150 ETFs by AUM, excluding debt ETFs. Performance figures are based on market price, not NAV. Premium/(discount) shows the average difference between the ETF's price and NAV over the past year. Tracking error reflects how closely the ETF has matched its benchmark returns. Liquidity is indicated by an icon next to AUM, based on average daily trading volume (ADTV): ☺ High – above ₹1 crore | ☺ Moderate – ₹10 lakh to ₹1 crore | ☹ Low – below ₹10 lakh.

NIRMAY CHOKSI

Sherlock Holmes of investing

Unmasking quality traps through forensic and governance analysis

A good investor reads balance sheets. A great investor reads between the lines.

Every checklist has its limits. Earnings look strong, margins are expanding, and the brand is recognised. There are many companies which passed the standard test before failing the only one that ultimately matters: honesty.

The gap between a convincing and an honest financial statement is where Forensic and Governance (F&G) analysis lives. Forensic asks whether the numbers hold together: are reported profits backed by actual cash flow, or dressed up by accounting choices? Governance asks whether the people in charge can be trusted: how do promoters behave, what do related-party transactions reveal, and are disclosures consistent or conveniently vague? Together, they serve one purpose: identifying companies worth avoiding before the market reaches the same conclusion.

The gap between a convincing and an honest financial statement is where F&G analysis lives

Why F&G analysis matters more than most investors think

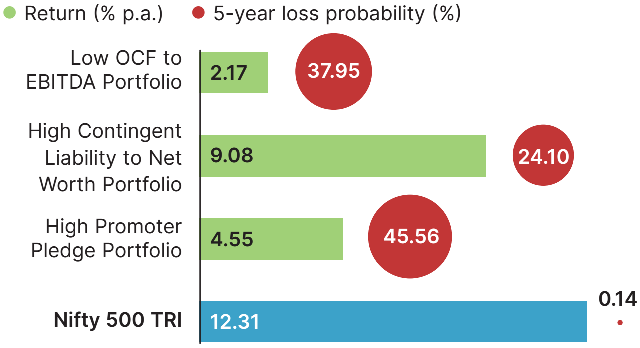
Think of a detective who rules out the innocent before pursuing the guilty. F&G analysis works the same way: remove the landmines first, then evaluate what remains on its own merits.

Some companies exploit the market's patience for a good narrative. Revenue gets recognised ahead of collection. Costs get capitalised rather than expensed. One-off gains get folded into recurring income. Working capital gets stretched until profits look healthy and cash quietly vanishes. The tell is almost always there.

Satyam Computers fabricated bank confirmations and inflated cash balances for years. IL&FS Transportation reported capital work-in-progress that never converted into productive assets, while promoter pledges

The cost of ignoring red flags

The real cost is capital, not just returns



Source: NJ AMC's Internal Research, CMIE, NSE, NJ AMC's Proprietary SmartBeta Research Platform. Data is for the period September 30, 2009, to February 28, 2026. The Low OCF to EBITDA Portfolio and the High Contingent Liability to Net Worth Portfolio comprise the bottom 50 stocks from the Nifty 500 universe based on their respective parameters. The High Promoter Pledge Portfolio comprises stocks with more than 25 per cent promoter pledge to their total holdings from the Nifty 500 universe. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained and is not indicative of future returns.

Not all quality is created equal

Even inside a quality portfolio, the F&G screen separates the compounders from the pretenders

Portfolio/Model	Sharpe ratio	5-year median rolling returns (% pa)	3-year loss probability (%)
NJ Quality+ Model	0.57	19.72	1.03
Top 80 stocks as per F&G ranking	0.62	22.43	0.28
Bottom 20 stocks as per F&G ranking	0.38	9.70	14.81

Source: NJ AMC's Internal Research, CMIE, NSE, NJ AMC's Proprietary SmartBeta Research Platform. Data is for the period September 30, 2006 to February 28, 2026. Top 80 stocks and Bottom 20 stocks as per F&G ranking represent stocks ranked based on Forensic & Governance (F&G) parameters from NJ Quality+ Model. NJ Quality+ Model is a proprietary methodology developed by NJ Asset Management Private Limited. This data represents a back-tested simulation and does not represent the performance of any existing Mutual Fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained and is not indicative of future returns.

remained stubbornly high.

Manpasand Beverages saw auditor fees rise sharply across consecutive years. Jet Airways carried contingent liabilities that dwarfed its net worth. In each case, red flags preceded the collapse. The data spoke, but most investors were not looking for it.

Two concepts explain why F&G analysis cuts through: earnings quality and reporting quality. The first checks whether profits are converting into sustainable cash flows. The second asks whether the auditor is independent enough to be believed. Even businesses with impressive performance can fail both tests. High ROE is not a defence against hidden liabilities or compromised disclosures.

F&G analysis does not promise out-performance. It promises fewer landmines.

Quantifying the red flags

F&G analysis is often mischaracterised as subjective. Red flags can also be quantified and screened systematically. See the chart titled 'The cost of ignoring red flags' on the previous page.

Promoter pledge: When a promoter pledges shares as collateral, the stock becomes leverage in someone else's financial position. A falling price triggers forced selling, which can drive it lower still. A portfolio comprising of companies having high promoter pledges delivered an annualised return of just 4.55 per cent between September 2009 and February 2026, against the Nifty 500 TRI's 12.31 per cent, with a five-year loss probability of 45.56 per cent.

Operating cash flow (OCF) to EBITDA: Profits can be shaped by accounting choices. Cash flows are harder to manufacture. When operating cash flow falls persistently short of reported EBITDA, the income statement is flattering the business. The Low OCF to EBITDA portfolio returned just 2.17 per cent annually, with a 37.95 per cent chance of loss over five years.

Contingent liabilities to net worth: Off-balance-sheet obligations, pending litigation and unresolved claims can accumulate until they overwhelm a company's financial buffer. High contingent liability portfolios returned 9.08 per cent annually, with a 24.10 per cent five-year loss probability. The Nifty 500 TRI's equivalent figure was just 0.14 per cent. The gap is the cost of ignoring red flags.

Elimination over selection

Sometimes, even high-quality companies can fail the F&G test. F&G analysis is not a replacement for quality; it is the necessary second layer. F&G analysis does not promise outperformance. It promises fewer landmines.

Even from a universe of 100 high-quality stocks (NJ Quality+), the bottom 20 companies as per their F&G ranking trail significantly behind the rest of the stocks with a 14.81 per cent loss probability and returns of just 9.70 per cent per annum. As opposed to this, the remaining top 80 companies carry a three-year loss probability of just 0.28 per cent and a five-year median rolling return of 22.43 per cent per annum.

NJ AMC's quantitative Forensic and Governance model is built on this logic, using quantitative screens to systematically detect red flags across its universe.

While quality gets you into the right neighbourhood, Forensic and Governance make sure you are not buying the house next to a crime scene. ☑

RANJIT BHATIA

When the world feels unsafe

The news screams crisis. Your portfolio whispers discipline.

February 24, 2022. Russia invades Ukraine. Markets fall 5 per cent in a day. Rahul, a disciplined investor, watches his portfolio show a ₹12 lakh loss. Messages flood in: "Sell everything", "Move to cash", "World War 3 is starting" His brother-in-law sells half his equity holdings and urges him to follow. It feels different this time—a geopolitical shock, not a routine market correction.

Rahul instead checks his allocation and rebalances to target allocation. Eighteen months later, his portfolio is up over 25 per cent. His brother-in-law is still sitting in cash, waiting for "clarity."

The headlines kept screaming. The disciplined portfolio stopped listening.

Every geopolitical crisis feels uniquely terrifying. Yet market history shows they rarely damage long-term returns.

The illusion of 'this time is different'

Every geopolitical crisis feels uniquely terrifying when we are living through it. Yet market history shows they rarely damage long-term returns. Markets recovered far faster than the fear suggested. Each crisis felt existential in real time, but ended up being a temporary speed breaker, as illustrated in the timeline mapped below.

No harm to long-term returns

These are the things markets care most about: corporate earnings, interest rates and valuations. Geopolitical events rarely change these fundamentals permanently.

Take the Russia-Ukraine war. Energy prices

Every crisis feels final. None has been.

1998
Russian debt crisis

Sensex fell over 10 per cent during the crises. Recovered fully within six months.

2001
September 11 attacks

Global markets crashed as terror and conflict fears spiked. Nifty fell 17 per cent in two weeks, but by December 2001 it had recovered.

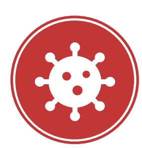
2008
Mumbai terror attacks

Markets already weak from the financial crisis fell further after fresh terror attacks. Sensex dropped to 8,500, but investors then saw it rise to 21,000 by 2010.

2019
Balakot airstrike

India-Pakistan tensions peak. Markets volatile for two weeks. Six months later, nobody remembered the dip.

2020
Covid crisis



Markets declined 32 per cent from March to April. Recovered within four months.

2022
Russia-Ukraine war

This was supposed to be a big one. Energy prices surged, nuclear war fears rose. Nifty fell from 18,000 to 15,200, but by September 2024, it crossed 25,000.

spiked. Supply chains were disrupted. Inflation accelerated. These created short-term volatility. But did they alter the long-term earnings trajectory of Indian companies?

ICICI Bank still lends money. Asian Paints still sells paint. Titan still sells jewellery. The war was terrible, but it did not stop Indians from banking, buying homes or getting married.

Corporate India adapted, found alternative suppliers and customers, and kept growing. Within a year, most companies' earnings had recovered or exceeded pre-war levels.

Contrast this with the 2008 financial crisis. That was not geopolitical but structural. Banking systems froze, credit dried up, and companies struggled to function. Recovery took years because the damage was economic, not just sentiment-driven.

Geopolitical shocks are usually sentiment shocks. They create fear, volatility and dramatic headlines. But they rarely break the underlying economic machinery.

The deadly temptation to time geopolitical events

When a crisis hits, our instincts scream at us to act. Doing nothing feels irresponsible. Ironically, this is where wealth often gets destroyed, not in the crisis itself but in the panicked response. Here is what typically happens:

Stage 1: Panic sell. Markets crash and you sell because "it will get worse."

Stage 2: Frozen wait. Markets stay volatile. You wait for "clarity" before entering again. Clarity rarely comes quickly.

Stage 3: Painful miss. Markets recover 20 or 30 per cent from the bottom. You are still in cash and it now feels too expensive to re-enter.

Investors who sell during geopolitical shocks usually underperform those who stay disciplined. Not because they choose poor investments but because they exit at the wrong time or remain on the sidelines.

Investors who sell during geopolitical shocks usually underperform those who stay disciplined

The rebalancing advantage

Here is the counterintuitive truth. Geopolitical crises can become opportunities for disciplined investors. When markets fall, equity as a share of your portfolio drops. Rebalancing forces you to buy low. Not because you are brave, but because you are systematic.

The greatest risk during geopolitical volatility is not that markets fall. It is that you sell low and turn temporary losses into permanent ones by missing the recovery.

The framework for handling geopolitical volatility

Before crisis: Set your system

1. Define your asset allocation based on goals and risk capacity, not geopolitical forecasts.
2. Set rebalancing bands. A range of ±5 per cent is common.

During crisis: Execute your system

1. Reduce news consumption. Headlines trigger emotion, not investment insight.
2. Check allocation, not daily prices. Once a month is enough. Did any asset class fall below your rebalancing band? Then act. If not, do nothing.
3. Rebalance systematically. Use new money to buy underweight assets.

After crisis: Review, don't regret

1. Evaluate the process, not just the outcome.
2. Avoid hindsight bias. Timing one crisis correctly does not mean you will time the next.

But what if this time really is different?

This question appears in every crisis. What if this war escalates? What if the global system breaks? Here is the honest answer. If the world truly collapses, portfolio allocation will not matter. Food, water and safety will.

But the probability is extremely small. In three decades of post-liberalisation markets, India has seen wars, terror attacks, political instability and global shocks. None permanently broke the system.

The framework summary

Do: Stick to your asset allocation, rebalance if allocations drift, reduce news noise, and focus on long-term fundamentals.

Don't: Panic sell, try to time the crisis resolution, assume 'this time is different', or let headlines override your system.

The world will always feel dangerous. That is precisely when your portfolio allocation should feel boring. ☑

SHYAMALI BASU

Three investors, one truth

An agony aunt, a rookie and a seasoned investor walk into a tea stall

In a busy tea stall near the stock market, all eyes were fixed on the ticker. No one could explain why stocks had corrected that day. Was it a flare-up between Russia and Ukraine, tensions involving Iran and the US, fresh uncertainty around the India-US trade deal, friction between China and its neighbours, or fears of an AI bubble bursting?

Everyone had a different theory.

Illustration: ANAND

Over the past year and a half, unsettling events have arrived in quick succession, keeping volatility high and investor nerves on edge.

That afternoon, three characters stood out in the stall.

Three kinds of investors

The first was the agony aunt. She worried every time the market dipped. Even when prices were flat, she complained about not earning enough. The tea stall owner knew her well and teased her gently.

Then there was the amateur, a post-Covid investor convinced he could outsmart seasoned fund managers. He proudly spoke about his gains but rarely mentioned his losses. His attention jumped from long bonds to equities, then to derivatives, crypto and metals. He was always chasing the asset that was rising and urging others to follow him online.

But after the recent correction across markets, he seemed lost. He spent his time blaming politicians, regulators and business leaders.

The third was different. A quiet, suave investor who often came for a cup of *cutting chai*. He listened to the chatter but remained calm. When pressed, he simply said he was a long-term investor. Trends did not disturb him because his investments matched his goals.

The suave investor's mantra

Curious, I asked him how he stayed so steady.

His answer was simple: discipline. He worked hard, lived comfortably, spent sensibly and enjoyed time with his family. But he never forgot to save and invest regularly.

Over the years, he had learnt that getting hyper is often a sign of taking on more risk than one can handle. Diversification mattered. Owning a portfolio of good, growing companies over time mattered even more. He had seen crises before, global shocks, Covid-19, sharp corrections. Those who panicked, he said, damaged both their health and their wealth.

To the agony aunt, his message was clear: there will always be something to worry about. Focus instead on what is in your control, steady investing guided by a sound plan.

> **Trying times** will pass. The real task is to stay focused, patient and aligned with your goals.

To the amateur, he offered a gentle warning. Chasing trends is futile. He recalled how even Isaac Newton lost money in a bubble.

Markets move in cycles, and greed often erases gains. Jumping onto a running train out of FOMO (fear of missing out) rarely ends well.

I am not sure whether the agony aunt or the amateur absorbed his advice. But it felt important to write it down.

Trying times will pass, as they always have. The real task is to stay focused, patient and aligned with your goals. ☑

Sapno ko skip nahi,
SIP Karo!

Dream Car, Dream Holiday, Dream Home… are, in reality, financial goals on our mind which we hold as dreams. But along with these, there also there also exists a doubt: “How many can I truly achieve, and if I really can?” And so we work hard, investing ourselves into our jobs, so we can make more money and give ourselves a chance of achieving atleast some of the dreams. That’s good. But just not enough because every dream is important. So what to do?

To put it simply – Start investing financially through SIP!
Invest your hard-earned money as smartly and systematically as you are yourself invested in your dream.

What is SIP?

Systematic Investment Plan, or SIP as it is called fondly, is a smart, easy and convenient way of investing a fixed amount of money, regularly over a defined period of time. The best part about SIP is its ability to arrest market-related ambiguity, by purchasing more units when the market’s low, and vice versa.

SIP is powering
10.29 Crores
folios, helping people fulfil their dreams!

Source : SIP Accounts as on January 2026

SIP is a good plan in more ways than one!

Inculcates Financial Discipline

Monthly and timely investments make you set aside a fixed sum, which helps you become a Disciplined Investor.

Rupee Cost Averaging

Since the market tends to be cyclic, SIP averages out the cost by buying more units when the market is low and lesser when the market is up.

Power of Compounding

It is like earning interest on interest – so, the longer you stay invested, more you benefit from the Power of Compounding.

Helps in Achieving Financial Goals

The best thing about SIP is that you can go about your financial goals, systematically, without puting a burden on your budgets, through small fixed investments that suits your wallet.

No Need to Time the Market

Since SIP is designed in a way to weather market volatility to the best of its capacity, it helps you counter the stress of timing the market.

Advt.

THE PLAN

Fixed income maturing soon? Deploy it smartly

A roadmap to help you invest your corpus to meet your financial goals

By Siddhant Madhav Joshi

Amit, 48, began investing in the Public Provident Fund (PPF) nearly 20 years ago. Like many Indians, he preferred the certainty of fixed-income investments and largely stayed away from equity.

Over the years, he also kept some money in his bank account for daily expenses. But he never formally created an emergency fund or consciously built a retirement portfolio.

Today, his PPF corpus has grown to ₹50 lakh and will mature soon. Now Amit faces a dilemma: How should he deploy such a large sum as retirement approaches? And so, he approached us with two key questions:

- Should he withdraw the entire corpus and treat it as emergency money?
- Can liquid or debt funds provide stability and returns comparable to PPF?

Fixed-income maturity: A moment to reassess

Amit's situation is not unusual. Many investors follow a disciplined, long-term saving approach but rarely anticipate how large their corpus might become over time. When such investments mature, uncertainty about how to deploy the money can lead to poor decisions and damage long-term wealth.

The first step is to organise financial goals into three distinct buckets:

- Immediate needs
- Medium-term stability
- Long-term retirement growth

Let us see how Amit could allocate his ₹50 lakh corpus across these three buckets.

Ring-fence your emergency fund

This bucket is meant for expenses that require immediate access to money. Since emergencies are unpredictable, the funds must be easily accessible and placed in low-risk, highly liquid instruments.

Suppose Amit's monthly expenses are about ₹60,000. His emergency fund could look like this:

Stable salaried profile: About six months of expenses, roughly ₹3.6-4 lakh

Higher responsibilities or variable income: Around 12-18 months of expenses, roughly ₹7.2-10.8 lakh

Liquid debt funds are well-suited for such needs. They typically offer returns comparable to fixed deposits, but without lock-ins or early withdrawal penalties. Access to money is also simple and quick.

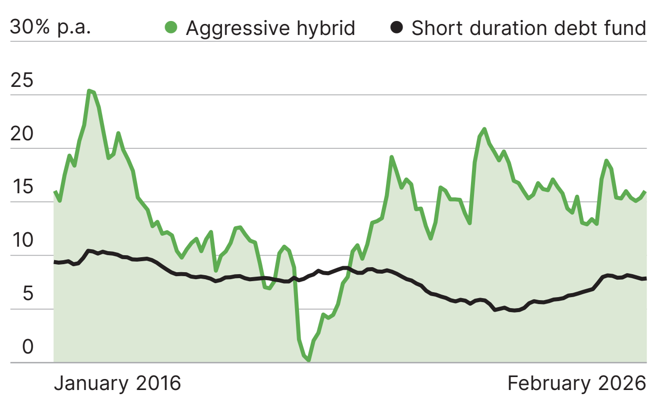
Extending PPF does not solve the liquidity requirement. Even though PPF allows withdrawals during the extended period, they are limited to one per year. A single withdrawal in a year does not qualify as true liquidity. Emergency funds must be available exactly when needed, without procedural constraints.

Create stability for medium-term goals

After setting aside money for emergencies, the next step is to allocate funds for medium-term needs.

Are aggressive hybrid funds suitable for retirement planning?

Over 3-year rolling periods, they outperformed short-duration funds nearly 90 per cent of the time



Based on three-year rolling returns from January 1, 2016 to February 28, 2026, for a median direct fund as per Value Research classification.

A prudent corpus allocation strategy for future goals

How much growth do you need to avoid a retirement shortfall?

Scenario	Starting corpus	Allocation	12-year outcome (illustrative)	Corpus required to maintain current lifestyle after retirement
Fixed income only	₹50 lakh	**Allocation:** 100% fixed income **Contribution:** Monthly SIP in PPF	₹3.0 crore	₹3.6 crore
Emergency + mid-term + retirement		**Emergency allocation:** ₹10 lakh in liquid funds **Mid-term needs:** ₹10 lakh in short duration debt funds or PPF **Retirement:** ₹30 lakh in agg. hyb. fund with monthly SIPs	₹3.7 crore	

Illustrative 12-year projections. Corpus based on the 4 per cent withdrawal rule with expenses growing at 6 per cent inflation. Annual returns assumed: PPF 7.1 per cent, liquid fund 7 per cent, aggressive hybrid fund 10.5 per cent. Based on a monthly SIP of ₹50,000 stepped up 10 per cent annually.

This bucket typically covers expenses expected over the next two to five years. Examples include a child's higher education, a home renovation, a wedding or other large family expenses.

Short-duration debt funds or conservative hybrid funds can work well here, depending on an investor's comfort with risk. These options usually offer higher yield potential than liquid funds while maintaining relatively stable returns.

PPF can also play a role in this bucket. It provides declared, predictable returns that are tax-efficient and generally more stable than most debt funds. For investors who value certainty, keeping some allocation to PPF within this bucket can make sense.

Build a retirement growth engine

At 48, Amit still has around 12 years before retirement. This gives him a meaningful window to pursue growth.

Keeping all his money in fixed-income investments may provide stability, but it is unlikely to generate the growth required to sustain his post-retirement life. A portion of his corpus, therefore, needs exposure to equity.

The remaining funds after building an emergency fund and a medium-term pool, can be invested in diversified, equity-dominant mutual funds. However, the investment should not be made all at once.

Instead, Amit can stagger the lumpsum over 12–18 months using a systematic transfer approach. This reduces timing risk and helps avoid emotional stress if markets become volatile during the investment period.

Alongside this, Amit should begin regular monthly SIP investments into this retirement growth bucket. Aggressive hybrid funds are suitable for this purpose, as they combine equity exposure with a debt cushion.

Data from the past decade highlights their potential. The average aggressive hybrid fund has delivered about 14.4 per cent annual returns, compared with roughly 7.9 per cent for an average short-duration fund over rolling three-year periods. Aggressive hybrids have underperformed short-duration funds in only about 11 per cent of observations, while negative returns occurred in just 0.7 per cent of the periods analysed.
See chart 'Are aggressive hybrid funds suitable for retirement planning?' on the previous page.

Post-retirement planning in a nutshell

Achieving a comfortable retirement requires disciplined, long-term investing. But it is equally important to deploy accumulated wealth wisely once large investments mature.

In Amit's case, a practical approach to allocating his ₹50 lakh corpus could look like this:

- ₹4.5-10 lakh earmarked for emergencies, ideally through liquid funds
- A portion allocated to medium-term needs, through short-duration funds and possibly continued PPF exposure
- The remaining amount is gradually invested in a retirement growth bucket through equity-heavy funds over 12-18 months. This should be complemented by regular monthly SIPs, which can be stepped up over time as income grows.

By structuring his finances into these three buckets, Amit can ensure liquidity for emergencies, stability for upcoming expenses and growth for his retirement years. ☑

Value Research

For expert advice

Tax while cleaning up portfolio

While cleaning up a portfolio may be necessary, selling old holdings can trigger tax, especially if held for 4-5 years. This can make portfolio clean-up feel costly. If tax is a major concern, should one avoid cleaning up the portfolio?

– Nikhil Chitalia

Though tax is an important factor to keep in mind while cleaning up your portfolio, it shouldn't be a reason to hold on to a poor-performing investment.

Selling mutual funds may trigger taxes, but delaying the decision only postpones them, not eliminates them. If the proceeds are moved to a better fund, the performance improvement can often offset the one-time tax cost over time.

Portfolio clean-up should therefore be guided by the quality of the holding and its prospects, not by tax anxiety alone.

At the same time, portfolio clean-up should be a selective, thoughtful process, not a justification for frequent churn.

Impact of new tax regime on ELSS returns

Do ELSS funds give lower returns under the new tax regime?

– Annavajjhala Venugopal

No. The new tax regime has not reduced the returns of ELSS funds. It has only reduced the appeal of the Section 80C tax deduction for those who would benefit by moving to the new regime.

From January 2018 to February 2026, ELSS funds delivered average five-year rolling returns of 15.3 per cent per annum. This is in line with flexi-cap funds and slightly ahead of the Nifty 500 TRI, which delivered annual returns of 14.8 per cent during the same period.

So, while ELSS may be less relevant for investors under the new regime who don't benefit from the Section 80C tax deduction, its return potential remains unchanged.

While ELSS may be less relevant for investors under the new regime, its return potential remains unchanged

Pros and cons of REITs

Please explain the pros and cons of investing in REITs

– Suhas Jamkhandi

REITs (real estate investment trust) offer a way to invest in real estate without requiring huge capital and the effort of buying and managing property directly. They provide diversification to an equity-heavy portfolio and, since regulations require them to distribute at least 90 per cent of net distributable cash flows, they also offer a steady stream of income.

However, REITs are neither fixed-income products nor pure growth assets. Their prices can decline when interest rates rise, and cash flows can weaken if occupancy falls, tenants leave, or refinancing becomes expensive. Taxation can also be uneven because different components of the payout are taxed at different rates.

For most investors, REITs should form only a small portion of their portfolio (around 5-10 per cent).

Picking the right index funds

Which are good index funds to invest in?

– Rita Dixit

While selecting index funds is simpler than choosing active funds, there are a few factors that still matter.

First, pick an index that matches your risk profile and investment horizon. For instance, choosing a small-cap index for a goal that is only three years away exposes you to the risk of sharp market corrections.

Second, choose a fund that tracks its index closely at a low cost. Pay attention to its tracking error and expense ratio. You should prefer funds where both these factors are meaningfully lower than others in the same category.

When selecting index funds, pay attention to their tracking error and expense ratio. Prefer funds where both are meaningfully lower.

Older struggles of NPS

If NPS looks so good on paper, why has it still not become as popular as one would expect?

Watch video

NPS, or National Pension System, has long had the ingredients of a strong retirement product. Its costs are among the lowest in the market, the investment framework is disciplined, and the returns have been respectable. So, the problem was never really about performance. It was about what happened at the end.

NPS was designed in the context of government employment, where retirement at 60 and the idea of a pension were central to the product's structure. This is why it came with a built-in annuity requirement, where at least 40 per cent of the corpus had to be used to buy an annuity. On paper, that sounds sensible. In practice, it made many investors uneasy.

The discomfort came from the fact that annuities in India have often been seen as inflexible and unattractive. Many retirees today do not fit the old template of stopping work at 60 and needing an immediate fixed pension. They may continue working, consult or simply want more control over how and when they use their money. For such people, being forced into an annuity felt restrictive.

That is what held NPS back: not poor returns, but exit anxiety. Investors were uncomfortable with the lack of choice at maturity. This is why recent moves to offer greater flexibility matter so much. In retirement products, reducing anxiety can often do more to improve adoption than adding yet another performance advantage.

What held NPS back was not poor returns, but exit anxiety. Investors were uncomfortable with the lack of choice at maturity.

After two extraordinary years, many investors began to feel that small-cap funds were somehow less risky than they really are

Small cap funds' return normalisation

Small-cap funds did very well in 2023 and 2024. What changed in 2025?

Nothing fundamentally changed in 2025. What changed was how investors viewed small-cap funds and the valuations they were willing to pay.

Watch video

After two extraordinary years, during which small-cap funds delivered very high returns, many investors began to feel that they were somehow less risky than they really are. That is often how trouble begins. Strong past returns create comfort, comfort attracts more money and that money pushes prices even higher.

There was also a structural reason behind the sharp rally. Once small caps were clearly defined as companies beyond the top 250 by market capitalisation, flows into dedicated small-cap funds became more concentrated. But this is still a relatively narrow and less liquid part of the market. Many of these companies have limited float due to high promoter holdings. Thus, when a lot of money enters the market, prices can rise disproportionately. The reverse is also true.

By 2025, the key question was whether the underlying businesses justified the prices being paid. Once valuations stretch too far ahead of fundamentals, even a mild disappointment can lead to a correction.

So, the decline in 2025 should not be seen as some structural failure of small caps. It is better understood as a normal cooling off after an overheated phase. The lesson is simple: when returns look unusually easy for too long, investors should become more careful. ☑

[SCOREBOARD] Guide

Optimise your investments with clear and comprehensive mutual fund data

▶ Serial Number

A serial number is generated for every fund and is the first column on the Scoreboard. To locate a specific fund, look for this number in the Index against the name of the fund.

▶ Portfolio Composition

For equity funds, it shows the portfolio's allocation in large-, mid-, small-cap stocks and cash/others. **Value Research** follows its own market-cap classification to arrive at this. The top listed companies that constitute 70 per cent of the market cap are classified as 'large caps'. The ones that fall between 70-90 per cent of the total market cap are classified as 'mid caps'. The smallest listed companies that comprise the remaining 10 per cent of the market cap are called 'small caps'.

In the case of hybrid funds, the minimum and maximum allocations to equity and debt over the past 12 months are displayed. For funds launched within the last year, the available historical range is provided. The equity exposure is shown net of derivatives (unhedged portion).

Portfolio Composition (%)			
Equity		Debt	
Min	Max	Min	Max

▶ Alpha

Indicates value added (or subtracted) by the fund vis-a-vis the benchmark, for the risk taken. A positive alpha indicates that the fund has performed better than expected, while a negative alpha indicates the fund has underperformed based on the risk taken by the fund manager. It is calculated using calendar month returns for the last three years.

		Performance								Portfolio Composition (%)										
		Returns (%)				Rank														
S.No.	Fund Name	1Y	3Y	5Y	10Y	1Y	3Y	5Y	10Y	Large Cap	Mid Cap	Small Cap	Cash & Others	Alpha	Info. Ratio	Risk Grade	Expense Ratio (%)	Assets (₹ cr)	Fund Rating	Average Rating

Portfolio Composition			
Credit Quality (%)			Avg. Maturity
High	Medium	Low	(years)

▶ Credit Quality

Debt fund's portfolio exposure across three levels:

- **High**
Includes exposure to government securities and corporate bonds with the highest grade ratings such as AAA, AAA+, AAA-, A1, A1+, P1+, AA+ and cash.
- **Medium**
Includes exposure to bonds with medium grade ratings such as AA, AA-, A2+ and A2.
- **Low**
Includes portfolio exposure to bonds with lowest grade ratings such as A+, A, A-, A3, BBB+, BBB, BBB-, BB+ and below.

▶ Average Maturity

Weighted average maturity of all debt securities held by the fund.

▶ Information ratio

Indicates excess returns generated by a fund relative to the category benchmark and the consistency of that outperformance. A higher information ratio compared to other schemes with the same benchmark reflects better risk-adjusted performance. It is calculated using calendar month returns for the past three years.

▶ Risk Grade

Value Research Fund Risk Grade measures a fund's risk of loss, focusing only on downside volatility, unlike standard deviation and beta. It accounts for absolute losses and periods of underperformance compared to a risk-free investment. This reflects the risk of earning less than a guaranteed return, such as from a term deposit. Fund risk is calculated by comparing monthly/weekly returns to the risk-free return (State Bank's 45-180 days Term Deposit Rate) and measuring underperformance. Average underperformance is used to derive a risk score, which is rated against the category average. The risk score of a fund is then rated according to the following distribution:

High	: Top 10%
Above Avg (+Avg)	: Next 22.5%
Average	: Middle 35%
Below Avg (-Avg)	: Next 22.5%
Low	: Bottom 10%

▶ Fund Rating

The **Value Research Fund Rating** is a convenient composite measure of returns and risk, based on a quantitative system without any subjective components. It provides a quick summary of a fund's historical performance relative to its peers, adjusted for risk. For equity and hybrid funds, the system combines three- and five-year performance periods, while debt funds' ratings are based on 18 months and 36 months of weekly risk-adjusted performance. Only equity funds with a minimum three-year performance history are rated, and for debt funds, the minimum is 18 months. A category must have at least 10 funds with an average AUM of at least ₹5 crore over the past six months to be rated. The rating distribution is as follows:

★★★★★	: Top 10% funds
★★★★	: Next 22.5%
★★★	: Middle 35%
★★	: Next 22.5%
★	: Bottom 10%
NR	: Not Rated

▶ Average Rating

The average of the monthly fund ratings over the past three years. For newer funds, the available rating history is used.

Numbers are in ₹ lakh; - indicates that the fund lacks sufficient performance history; data as of February 28, 2026

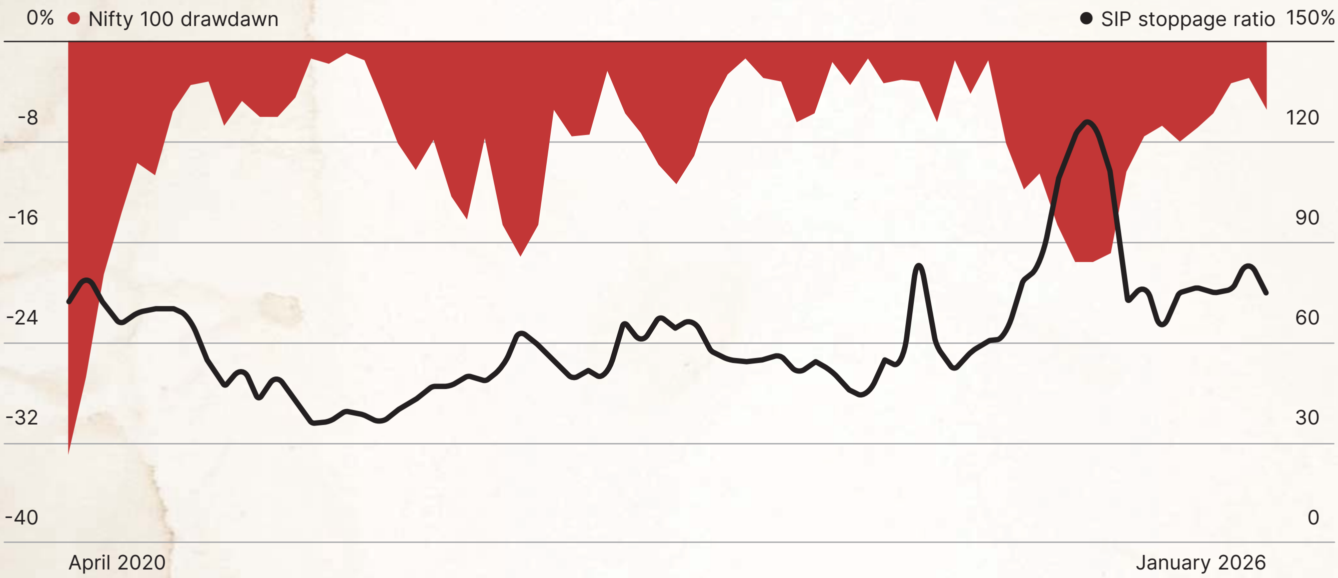
END NOTE

Panicking is the real risk

Volatility passes. Missed returns don't.

When markets fall, investors pull back

Market declines test discipline, and many investors fail that test



SIP stoppage is calculated as the percentage of SIPs discontinued relative to new SIPs registered in that month. Nifty 100 data is from Apr 1, 2020 to Jan 31, 2026.

Best days don't come easy

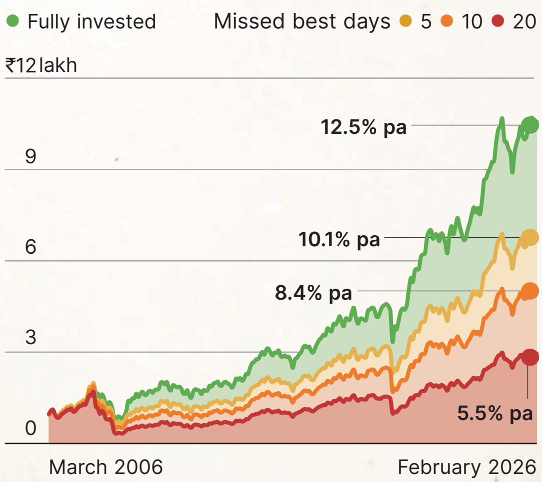
Most of Sensex's best days came after sharp declines

Rank	Date of best day	1 day return of best day (%)	Previous 1 month return (%)	Previous 3 month return (%)
1	May 18, 2009	17.3	29.6	58.4
2	Apr 07, 2020	9.0	-20.0	-26.4
3	May 18, 2004	8.3	-16.8	-19.1
4	Oct 31, 2008	8.2	-25.0	-31.8
5	Oct 13, 2008	7.4	-19.2	-16.0
6	Apr 07, 2000	7.2	-6.6	-3.6
7	Mar 25, 2020	7.0	-29.2	-31.2
8	Jun 15, 2006	6.9	-19.3	-11.6
9	Jan 25, 2008	6.6	-7.5	-2.2
10	May 04, 2009	6.4	17.3	31.9

Based on Sensex values from January 03, 2000 to January 28, 2026.

Cost of missing a few key days

A handful of missed days can reshape wealth



Based on investment of ₹1 lakh in the Nifty 100 TRI from March 2006 to February 27, 2026.
