MFs & SIFs

different in shade, united in purpose

Mutual Funds (MFs) and Specialized Investment Funds (SIFs) perfectly complement each other in achieving a well-rounded and resilient investment portfolio. The balance of long and short positions in your portfolio work harmoniously in balancing risk and reward for a more dynamic and resilient investment strategy. MFs provide potentially steady and long-term growth, while SIFs help capture both long-short opportunities, using derivatives, offering potential gains in both rising and falling markets

When prices differ, smart investors capture the spread

INVEST WITH ARBITRAGE FUNDS

Arbitrage Funds aim to benefit from price differences (or price spreads) between the cash and derivatives markets. By simultaneously buying a stock in the cash market and selling it in the derivatives market, these funds seek to capture the price spread between the two. By capturing these spreads, the strategy focuses on opportunities created by temporary market inefficiencies rather than relying on market direction. This approach can help limit exposure to broad market movements.

Mutual Fund investments are subject to market risks, read all scheme related documents carefully.

An investor education initiative by

LIC MUTUAL FUND

INVESTING KA EASY BUTTON

No stock-picking. No guesswork.
Just your money, spread across the market
automatically.

What is a Passive Fund?

A passive fund (Index Fund or ETF (Exchange Traded Fund)) mirrors a market index like Nifty 50 Index or Sensex Index. It doesn't try to beat the market, it simply follows it. Your money is spread across all companies in the index, in the same proportion. Simple, transparent, low-cost.

Lower Cost

Since the fund tracks an index, it typically carries a lower expense ratio, keeping your investment costs transparent.

Full Transparency

You always know exactly what you own.
No surprises, no black boxes.

Diversification within Index/ Sector

One fund. Many companies. Many sectors in a single step.

You don't need to find the best stock. Sometimes, owning the whole market is the smartest move.

Curious about passive investing?

To know more, please consult your Financial Adviser

Mutual Fund investors need to complete the Know Your Customer (KYC) process, which can be done by submitting completed KYC Form along with the required documents at any AMC's branch Office or Official Points of Acceptance. Please refer <https://www.licmf.com/kyc-redressal> to know about KYC documentary requirement, procedure for change of address, phone number, bank details etc. The investors are cautioned to invest only with SEBI registered Mutual Funds, the details of which can be verified on SEBI's website under 'Intermediaries/Market Infrastructure Institutions' (<https://www.sebi.gov.in/intermediaries.html>.) For any complaints and grievance redressal, investors can contact the Investor Relations Officer of the respective AMC and if not satisfied with the resolution given by the AMC, he/she can approach SEBI by registering the complaint on SEBI SCORES Portal (<https://scores.sebi.gov.in/>) and/or escalate the complaint through Online Dispute Resolution Portal (<https://smartodr.in/login>).

MUTUAL FUND INVESTMENTS ARE SUBJECT TO MARKET RISKS, READ ALL SCHEME RELATED DOCUMENTS CAREFULLY.

FIRST PAGE

What's in a name

Dhirendra Kumar
Editor-in-chief

There is an assumption that most mutual fund investors carry around without even realising it: that a fund's category name tells you what the fund does. It is a reasonable assumption. SEBI spent years recategorising funds precisely to create this clarity. The category name is meant to be a reliable shorthand, a way for an investor to know at a glance what kind of portfolio they are looking at.

The multi-asset allocation fund (MAAF) category proves the assumption wrong. A fund in this category may hold between 20 per cent and 70 per cent of its net assets in net equity. That is not a narrow band. That is half the equity risk spectrum. Two funds sitting in the same SEBI-defined category can behave like completely different products. One might be a conservative hybrid with a 25 per cent equity allocation. Another might be an aggressive hybrid at 65 per cent. Both carry the same MAAF label. The name, in other words, tells almost nothing about managing investors' money.

This is not a new problem. It is a problem that SEBI tried to solve and ended up recreating. Before the 2017 recategorisation, balanced funds suffered from the same ambiguity. The category permitted a wide equity range, and investors frequently discovered, too late, that the fund

they had bought was far more aggressive or far more conservative than the name had suggested. The recategorisation was meant to fix this. It did, for most categories. For MAAFs, it simply moved the confusion to a different label.

The real problem is this: the infrastructure that helps investors understand what they own has not kept pace with the infrastructure

close that gap. For MAAFs, they have not.

Our cover story this month does what the MAAF label should have done but did not: it classifies funds by what they actually do, by how much equity they hold, how they behave in market downturns, and what kind of investor each bucket suits. It is the work that SEBI's categorisation was meant to perform. We had to do it ourselves because the category name alone will not tell you what you need to know before you invest.

SEBI's 2017 recategorisation was a step forward, but it was not the last step. If a category name permits a 50-percentage-point equity range, the category is too broad to be useful. The industry knows this. AMFI knows this. The solution is not complicated: create sub-categories, mandate risk labels and require fund houses to state equity ranges in their category tags. These are not radical demands. They are the minimum conditions for informed investing. Until that happens, investors will keep picking funds based on labels that promise clarity and deliver confusion.

For now, if you are considering a multi-asset allocation fund, read the cover story before you invest. The label will not protect you, but understanding what is behind it will.

- Category names can still mislead investors
- MAAF category spans a dangerously wide equity range
- Distribution outpaced investor understanding tools
- Look beyond labels, understand actual allocation

that sells it to them. The Indian mutual fund industry has grown extraordinarily fast. Distribution is everywhere. Apps make investing frictionless. SIPs can be set up in under two minutes. New investors enter the market every month, many of them relying entirely on category names to make their choices. But the tools that help an investor figure out what is actually inside the fund they are buying have lagged. Category labels were meant to

DHIRENDRA KUMAR

The questions your advisor never answered

Because the industry was built to sell, not to answer

How am I actually doing?

Should I be worried about that fund that has been sliding for 18 months?

Have I got too much in small caps?

What do I do with the three funds I stopped paying attention to after 2020?

Where should my next SIP go?

Am I on track for my son's college?

What on earth is happening in the market this week?

I have been keeping a mental version of this list for 30 years. Every investor I have ever spoken to carries some version of it around. Think of a professional in her 40s, say, who has been investing for a dozen years, who holds nine or 10 funds, who feels reasonably competent about money, and who, in an unguarded moment over coffee, would admit to a rotating set of small questions that never quite go away.

Look at that list again. Not a single question on it is difficult. A competent advisor with full access to her portfolio could answer any of them in a few minutes. And yet, for most Indian investors, these questions remain unanswered for years. Sometimes for decades.

The reason is not that the answers are hard to find. It is that the advice industry we have built in this country is not structured to give them.

The relationship manager at the bank is measured on the products he sells; he has no incentive to tell you your portfolio is fine and that you should do nothing. The distributor earns a commission for activity, and dormant portfolios are not profitable for him. The social-media expert does not know you at all. He is broadcasting to a crowd. The WhatsApp forward tells you what to buy, but never what to ignore. Each of these sources answers questions you did not quite ask, and leaves the ones you did ask hanging in the air.

This is the gap *Value Research Fund Advisor* was built to fill. It is, above all, a place where those questions finally have somewhere to go.

Consider what answering them genuinely requires. To say something useful about “**how I am doing?**”, you need someone who has looked at your whole portfolio across family members, across AMCs, across the accumulated layers of years, through a lens that is not trying to sell you anything. That is the work our Portfolio Analysis does. A subscriber wrote to us last month with 11 funds across two demat accounts and three folios. The analysis showed that four of them were large-cap funds doing almost exactly the same job, and that her “diversified” portfolio was in reality a 70 per cent large-cap bet with some decoration around the edges. She had been adding to it for nine years without noticing.

Every source answers questions you did not quite ask, and leaves the ones you did ask hanging in the air

Illustration: Anand Kumar

“What do I need to fix?” is the next obvious question, and here the answering tool is our Buy, Sell, Hold and Avoidable verdicts. Every major actively managed equity and hybrid fund in the country gets a clear tag, is updated regularly, and is written up so you can see the reasoning. A Sell is not a star rating grumbling its way downward. The analyst believes better options exist for the job this fund is meant to do. One subscriber had been holding on to a mid-cap fund for four years, watching it drift, telling himself it would turn around. Our Sell verdict gave him the one thing he had been missing: a written reason to act, from someone with no commission to earn from the switch. He moved the money, and he stopped losing sleep over it.

“Where should I invest next?” has two answers, depending on the kind of investor asking. For someone who wants to pick her own funds from a short, trusted list, there is *Analyst’s Choice*, our hand-picked selection from the Buy universe and our highest-conviction calls. For someone who would rather have the whole thing built for her, there is the *Portfolio Planner*, which takes a goal, a time horizon and a risk appetite to construct a complete portfolio, including asset allocation and fund selection. Two legitimate ways investors like to work, served without fuss.

The Planner also answers what is arguably the most important question on the original list: **“Am I on track for my goal?”** A fund down 12 per cent over two years may still be the right holding for a goal 12 years away. A portfolio that looks conservative may be reckless against a three-year target. The Planner holds the goal and

the portfolio together, and continuous re-evaluation tells you whether the two are still in step as markets move and circumstances change.

That leaves the last, and most persistent, question: **“what is going on? Is there something I should be worried about this week? Is there a new idea worth my attention?”** This is where I come in. Every Saturday, I write the *Advisor’s Note*, which lands in subscribers’ inboxes with my best attempt at cutting through the week’s noise: what to ignore, what the real risk is, and what mistake you are most likely to be making right now. And once a month, the fund analysis team and I go live with members directly, with no scripts and no sales pitches, to take whatever question is on their mind that day.

It is this last piece where Fund Advisor stops looking like a product and starts looking like something else. The tools I have described, the Analysis, the verdicts, the Planner and the Analyst’s Choice, are individually useful, but any competent team could build something like them in a year. What makes them worth subscribing to is that they are part of a relationship. A known person, writing to you at a known time each week. A known team, taking your questions in a known session each month. And an income model that is limited to your subscription and nothing else. On our Fund Advisor landing page, this is stated plainly: we will never earn a rupee from advising on a fund. That single sentence explains why the answers you get from us are the answers you get, and not some adjacent set of answers that happens to be more profitable for us to give. ☑

What makes Value Research Fund Advisor worth subscribing to is that it is part of a relationship, not a product

Move between market caps for more opportunities.

Choose Flexicap funds that aim to benefit from opportunities across large, mid and small caps.

A Flexicap fund has the flexibility to invest across large, mid and small cap stocks. This unrestricted nature of the fund enables the fund manager to pursue multiple investment opportunities across the market and tap them regardless of their size. Since they provide exposure to a broad equity spectrum i.e across market caps and sectors, it leads to a well-diversified portfolio striking a balance between risk and returns in a single portfolio.

To know more, speak to your mutual fund distributor/financial advisor for more advice on how flexicap funds can be part of every portfolio.

Letters to the Editor's Note

Your responses to 'At financial summits, every speaker is selling something'

Dhirendra Kumar's Editor's Note, *At financial summits, every speaker is selling something*, published on April 4, 2026, unpacked how seemingly expert opinions at market forums are often shaped by incentives rather than impartial insight. He argued that what appears as conviction is frequently a sales pitch in disguise, driven by industry interests.

The piece resonated with readers who recognised how easily persuasive narratives can blur the line between advice and promotion.

Aditya Roy/AI-generated image

Summary

A viral clip from a recent financial summit showed a fund manager passionately arguing that India is the best investment destination today. The sharpest response came in a simple comment: “Never ask a barber if you need a haircut.” It captured the core issue—what sounds like advice is often a sales pitch shaped by incentives.

The fund manager runs a fund investing only in Indian equities. Of course, she believes in India's prospects. This is not a moral failing; it is how incentives work. But for the viewer, the distinction between genuine conviction and structural

selling is invisible.

Another speaker offered a more revealing insight: the recent surge in retail participation has partly provided an exit route for foreign institutional investors. When FIIs were selling heavily in 2022-23, domestic investors, channelled through SIPs, were on the other side, absorbing supply. The timing is hard to ignore.

Retail participation in equities is beneficial when driven by understanding. But there is a difference between informed investing and being guided into markets because the system needs buyers. The financialisation of

savings has been widely celebrated, yet whether it has equally benefited savers remains an under-asked question.

This is not about one individual. At such events, everyone is selling something—AUM, trading volumes, research credibility or personal brand. The new investor has no easy way to identify these incentives. Rarely are basic questions asked: who benefits if I follow this advice, and what do they lose if they are wrong?

So, when you hear a confident investment argument, ask who is speaking and what they are selling. It may not invalidate the advice, but it will change how you hear it.

PPFAS 
MUTUAL FUND
There's only one right way®

[READERS' VOICE]

What our readers say

All speakers have their own agenda when offering gyan about the next big investment opportunity or warning you not to miss a once-in-a-lifetime chance. It's best to stick to your asset allocation and sell only when:

a) your goal has been reached, b) the fund's performance is consistently poor (say, over the last 5-6 quarters), or c) you urgently need the money.

Follow this discipline, and in my opinion, you will rarely go wrong.

N M Rajugopal Shreedhar

Very well said and neatly summarised. There is no free lunch. Financial summits are essentially marketing platforms, and speakers are paid. Investors must learn to separate milk from water, like a swan.

Sarita Pandya

This is among your best articles and one much needed today. Sales pitches disguised as advice and education are flooding every possible channel, and investors need to be alert.

Kartik Iyer

Brilliantly put. I watched the panel discussion you referred to, and the flaws in the 'India story' argument presented by the sole lady panellist seemed quite obvious. It shows how selectively chosen data can support almost any narrative.

Small retail investors like me have little choice but to stay invested in Indian markets, even at high valuations. Over the long term, I remain optimistic about India's earnings story.

Ravi

You made a sharp point about incentives shaping the tone and content of financial summits. I agree that much of what passes as "advice" is often coloured by commercial interests, and that retail investors rarely see the fine print behind the passion. The barber analogy captures this well: conviction is rarely neutral when livelihood depends on persuasion.

That said, I would temper the

conclusion slightly. Not every speaker is purely selling. Sometimes conviction and commercial interest align with sound analysis. A fund manager bullish on India may be talking her book, but she may also be right. The challenge is not to dismiss such views outright, but to filter them with awareness of incentives.

On retail participation, the timing of rising SIP flows

during heavy FII (foreign institutional investor) outflows does raise valid concerns. Yet, systematic investing remains a powerful tool if backed by financial literacy, not just industry cheerleading.

Financial summits are not neutral classrooms; they are marketplaces of persuasion. The takeaway should be vigilance: listen, but interrogate.

Ashok Malhotra

Clarity, not chaos

The smartest guide
to Indian investing

For more info on KYC, changes in various KYC details & redressal of complaints, visit <https://bit.ly/3UjIQJr> Investors may also register their complaint on the SEBI SCORES portal. Investors are cautioned to deal only with the Mutual Funds registered with SEBI, details of which can be verified on the SEBI website under "Intermediaries/Market Infrastructure Institutions. This document has been prepared by Bandhan AMC Limited for general information purposes only and should not be construed as an offer, recommendation or investment advice. There is no assurance or guarantee on return of investments. Neither Bandhan AMC Limited/Bandhan Mutual Fund nor any person connected with them, accept any liability arising from the use of this document. Investors should seek personal and independent advice regarding the appropriateness of investing in the schemes of Mutual Fund and/or tax implications on withdrawals. From a tax perspective, withdrawals from mutual funds can be subject to capital gains tax. If you hold these funds for less than a year, a 20% Short-Term Capital Gains (STCG) tax will apply. However, if you hold them for more than a year, you'll be subject to a 12.5% Long-Term Capital Gains (LTCG) tax. When investing in debt mutual funds, gains are taxed based on your income tax slab. Therefore, factoring in these tax implications when planning your withdrawals is essential. Past performance may or may not be sustained in future

Salary Wala Plan is a creative representation of Systematic Withdrawal Plan ("SWP"), a feature offered by Mutual Fund Schemes. SWP allows the Unitholders to withdraw a predetermined sum of money periodically from his investments in the Schemes. SWP is ideal for investors seeking a regular income stream for meeting their financial needs. It is also ideally suited for retirees or individuals who wish to invest lumpsum amount in Schemes and systematically withdraw from the investments over a period of time.

The ‘boring’ asset that shields your portfolio

When times get rough, debt comes in handy

By Siddhant Madhav Joshi

The past 18 months have tested investors. First, the correction. Then tariffs. Now, the US-Iran conflict. With markets in the red, portfolios have stagnated and optimism is fading; not into panic, but into something more corrosive: a slow withdrawal of conviction.

The signs are visible in declining SIP flows and rising stoppage ratios. Investors are not fleeing. They are gradually disengaging. And in investing, that drift often does more lasting damage than any single moment of fear. This pattern is not new. Between April 2022 and June 2023, when markets went sideways for over a year, SIP momentum dropped, recovering only once markets did (see graph: ‘SIPs lost momentum as conviction faded’).

These phases expose two things: the fragility of equity-heavy portfolios and the cost of ignoring debt.

How investors sabotage their own wealth

When markets turn shaky, pausing a SIP feels sensible. But it rarely is.

Compounding is unforgiving about interruptions. Even a brief pause changes outcomes. Investors who

step away typically return only after confidence is restored, by which point much of the recovery is gone. Market volatility is rarely the real threat. The inability to stay invested usually is.

This is where debt earns its place.

Debt: The boring companion you cannot afford to ignore

The numbers tell their own story. Equity mutual funds hold ₹35.4 lakh crore in assets. Hybrid funds, which blend equity with debt, hold ₹11.1 lakh crore. Simply put, for every four rupees in the market, three go into pure equity funds, while only one gets real diversification through hybrid funds.

Investors have overestimated their risk appetite and underestimated what stability does for a portfolio. The table ‘When equity stalled, debt did the work’ makes the case. While equity took one to two years to recover, short-duration debt funds delivered 12-13 per cent returns over the same periods. Portfolios with debt rode out the turbulence. Those without it faltered.

SIPs lost momentum as conviction faded

Median QoQ SIP growth has more than halved since the market peaked in September 2024

Source: AMFI monthly flows. Nifty 500 TRI value rebased to 1000 on July 31, 2021. Due to the unavailability of March SIP flow data as of April 2, 2026, the last quarter flow is compared with the 66.67 per cent flow of the quarter ending December 2025.

When equity stalled, debt did the work

While equity remain stagnant, debt funds continued delivering modest but steady returns

Period of 0 equity return	Debt fund return (from peak to recovery) (%)	Years of 0 return from equity
Nov '10 to Mar '14	35.3	3.4
Mar '15 to July '16	11.6	1.4
Aug '18 to Jan '20	7.5	1.3
Feb '20 to Nov '20	6.2	0.7
Oct '21 to Nov '22	4.2	1.1
Sep '24 to Apr '26*	9.4	1.5*

Market fall periods refer to drawdowns of more than 15 per cent in the Nifty 500 TRI between April 1, 2010 and April 1, 2026. Debt fund returns refer to absolute returns generated by the regular plan of an average short-duration debt fund from the market peak until the Nifty 500 regained that peak. *In the last phase, the September 2024 peak had not recovered as of April 1, 2026.

The ideal debt allocation according to your situation

There is no universal debt allocation. Your life stage and risk appetite determine yours.

Investor profile	Typical situation	Suggested debt allocation (%)	Why this works
Young salaried (20s–early 30s)	Stable income, long-term goals, no immediate liabilities	10-30 	Lower need for liquidity; equity can dominate, but some stability prevents behavioural mistakes
Mid-career salaried (30s–40s)	Family responsibilities, multiple goals (education, home)	20-40 	Balances growth with stability; protects near- to medium-term goals
Variable income (business / freelance)	Unpredictable cash flows, uneven income cycles	30-50 	Higher buffer needed to manage uncertainty and avoid forced equity exits
Pre-retirement (50+)	Approaching retirement, wealth preservation focus	30-50 	Ensures stability of corpus while retaining some growth through equity

Less fall, more control

Adding just 30 per cent debt cut drawdowns by more than 8 percentage points in market declines

Drawdown (%)

- 100% equity
- 70% equity / 30% debt
- 50% equity / 50% debt
- 40% equity / 60% debt

Periods shown represent market falls of more than 15 per cent in the Nifty 500 TRI. Equity returns are based on the Nifty 500 TRI, while debt returns use the category average of short-duration debt funds.

How much debt is enough?

Debt will not make your portfolio immune to market falls. But it will make the fall easier to deal with and that difference matters more than it sounds.

Data shows that adding just 30 per cent debt to an all-equity portfolio has trimmed drawdowns by five to twelve percentage points across every major market fall since March 2010 (see chart: 'Less fall, more control').

A portfolio that falls less needs less time to recoup. More importantly, it stays easier to hold, and a portfolio an investor can actually hold is one that compounds.

That said, 30 per cent is a starting point, not a formula. The right debt allocation depends on income stability, dependents, proximity to goals and temperament.

A young salaried investor with no major liabilities can work with 10-30 per cent in debt. Someone with variable income or approaching retirement needs more, typically 30-50 per cent, to protect capital and preserve stability when it matters most.

The takeaway

A portfolio built only for growth will, at some point, become difficult to hold. Equity delivers the long-term, inflation-beating returns that build wealth. But it is debt that helps it ride through the rough tides.

The past 18 months have not just tested portfolios. They have tested the investors behind them. The ones who endured and stayed were almost always the ones who had built in room to absorb the discomfort.

That is what debt does, quietly, unglamorously and exactly when it is needed most.

Insured, but not covered

Why valid cashless claims get denied, and what to do now

By Siddhant Madhav Joshi

You buy health insurance for one reason: so that when you are hospitalised, money is not your biggest worry. But increasingly, even with a valid policy, an empanelled hospital and a legitimate treatment, cashless claims are being denied. This is not a fringe issue.

According to IRDAI's Bima Bharosa portal, FY2024-25 saw 1,37,361 grievances linked to general and health insurance, a 45 per cent spike year-on-year, with nearly 69 per cent of those being claim-related. So, while it's true that the system is settling more claims than before, it is trying to shave more money off each one.

Why your cashless claim might be at risk

Policyholders often choose a policy based on whether it offers cashless treatment, and understandably so. Cashless means no large upfront payment at the hospital, no scrambling for funds in the middle of a medical emergency. But cashless treatment is a feature, not a right. And it is an increasingly fragile one.

Every cashless transaction involves three parties: the hospital, the insurer and a TPA—a third-party administrator, which is an intermediary company that processes claims on the insurer's behalf. When any one of these three is out of step, the whole arrangement can break down.

Hospitals deny cashless for several reasons: delays in insurer approvals, disputes over package rates, deductions so steep that cashless

becomes commercially unviable for the hospital and persistent payment backlogs from insurers. In recent months, some hospital groups have suspended cashless facilities for certain insurers entirely, leaving patients with no choice but to pay upfront and seek reimbursement later. These are not isolated incidents. They are recurring episodes of a structural standoff between what insurers will pay and what hospitals will accept, and it is the policyholder who bears the cost.

Cashless denied? Here's your next step

Act quickly. Get the denial in writing. Switch to reimbursement and collect itemised bills. Escalate to the insurer in writing, not just by phone.

If there's no response, approach the Bima Bharosa portal or the Insurance Ombudsman, a free grievance mechanism most policyholders don't know about.

What most policyholders get wrong

The typical insurance buyer compares premiums and claim settlement ratio, or CSR. But CSR only measures the percentage of claims settled by number. It says nothing about how much was actually paid, how long it took or how often cashless was denied.

A more revealing measure is ombudsman complaints normalised per lakh policyholders. According to the CIO Annual Report 2024-25, Star Health recorded 12,186 ombudsman complaints, Care Health 4,423 and Niva Bupa 3,983. Absolute numbers naturally favour larger insurers, so the ratio normalised per lakh policyholders is what actually tells you how a company behaves when a claim is filed.

Finally, no policy fully eliminates cashless risk. Keep a credit line or liquid fund covering two to three weeks of hospitalisation costs in your city, not as a backup, but as a baseline. The goal is to never be financially hostage to a system dispute when a family member is on a hospital bed. ☒

Multi-cap vs flexi-cap funds

Where should your money really be?

By Abhishek Rana

Before getting into which category wins between multi-cap and flexi-cap funds, it helps to understand why the comparison exists. Until a few years ago, multi-cap funds had the freedom to invest across market capitalisation without allocation rules, often tilting towards large caps. That changed in late 2020 when SEBI mandated at least 25 per cent each in large-, mid- and small-cap stocks. This structured approach limited flexibility, prompting the creation of flexi-cap funds.

Flexi-cap funds retain the original 'go-anywhere' mandate, allowing fund managers to allocate freely across market caps. Today, the divide is clear: one is rule-bound, the other unconstrained.

Where they meet and diverge

The two categories look similar on the surface. Expense ratios are nearly identical, and sector preferences overlap, with financials, industrials and consumer discretionary dominating both. The difference lies in allocation.

A flexi-cap fund operates with genuine discretion. They can allocate 100 per cent of the corpus to large caps or shift heavily to smaller companies. Multi-cap funds, in contrast, must maintain at least 25 per cent each in large-, mid- and small-cap stocks. The remaining 25 per cent can go wherever the manager pleases.

Clearly, flexi caps enjoy much more freedom. But as it turns out, they still park most of their money in large

Similar on the surface

The two have similar sectoral preference and costs but different allocation rules

Parameter	Flexi cap	Multi cap
Number of funds	84	33
Median AUM (₹ cr)	2,686	3,142
Largest fund by AUM (₹)	Parag Parikh Flexi Cap (1.3 lakh cr)	Nippon India Multi Cap (50,820 cr)
Asset weighted expense ratio (%)	0.72	0.70
Top 3 sectors by weightage (%)	Financials (30.9), Industrials (12.4), Consumer Discretionary (12.4)	Financials (26.7), Industrials (15.0), Consumer Discretionary (14.7)

Data as of February 28, 2026. Active funds per Value Research fund classification.

caps. Going by the three-year average market cap allocation of active funds which are at least three years old:

- Flexi caps on average have held 65 per cent of their assets in large-cap stocks.
- Multi caps held only 43 per cent with higher tilt in mid- and small caps.
- By count, 65 flexi-cap funds had over half their allocation in large caps.

Leaning towards large caps

Given a free hand, most flexi-cap managers still play it safe

	Number of funds	
Large-cap allocation range	Flexi-cap funds (Out of 70)	Multi-cap funds (Out of 18)
Less than 25%	0	0
25 to 50%	5	18
50 to 75%	50	0
More than 75%	15	0

Based on three-year average allocation of active funds with at least three years of history as of February 28, 2026. Fund classification as per Value Research.

Jun '22 to Nov '22	Recovery	21.8	19.6	22.1
Nov '22 to Sep '24	Bull	58.8	61.5	74.6
Sep '24 to Feb '25	Bear	-18.6	-19.0	-19.8
Feb '25 to Jan '26	Recovery	22.2	17.7	18.8

Bull phase: When Nifty 500 TRI went from the previous peak to the new one. Bear phase: When it declined 15 per cent or more from its peak. Recovery phase: When it climbed back to the previous peak from the bottom. Fund classification as per Value Research.

● All multi-cap funds maintained the necessary 25-50 per cent range. See table: Leaning towards large caps.

What their returns say

Since both categories have only been co-existing since 2021, we checked performance data as far back as that period across different market phases.

See table: Same market, different outcomes.

● In both bull runs since 2021—periods when the Nifty 500 TRI scaled new peaks—multi-cap funds on average strongly outstripped their flexible peers.

● In bear phases—periods when the index slumped 15 per cent or more from its peak—multi caps fell only slightly more on average.

Multi caps lead on risk-adjusted returns

The riskier category comes with returns that justify the higher volatility

Based on category averages. Average ratios over three-year rolling periods measured at six-month intervals from February 2024 to February 2026. Fund classification as per Value Research.

● During recovery phases—periods when the index bounced back to its earlier peak from the bottom—they were again ahead of flexi caps if only modestly.

Put simply, multi-cap funds have delivered stronger upside without materially worse downside so far. However, this comes with an important caveat. The period since Covid has largely favoured mid- and small-cap stocks. A prolonged downturn in these segments, as in earlier cycles in 2008, 2011 and 2018, has yet to fully test multi-cap funds.

Are the extra returns worth the extra risk?

Another important parameter to judge them on is whether their recent gains justify the volatility that comes as a result of their mid- and small-cap exposure.

The Sharpe ratio answers this. It measures how much return a fund generates for every unit of risk it takes on. A higher number means investors are compensated better for the volatility they endure.

We measured three-year average rolling Sharpe ratios for average funds in both categories at six-month intervals starting February 2024—the first point at which a full three years of post-2020 data was available—through February 2026. This gave us five distinct three-year observing windows and multi-cap funds led in each of them. See graph: Multi caps lead on risk-adjusted returns.

Multi-cap funds did not just deliver higher returns. They delivered better returns for the risk they took, which was higher due to their mid- and small-cap slice. Flexi-cap funds despite their lower volatility and heavier large-cap tilt delivered lower returns in proportion to the risk they took.

So which fund is right for you?

Flexi-cap funds are in practice large-cap-heavy funds. Multi caps by mandate are more diversified with a meaningful portion always in mid- and small caps. That is the single biggest reason they have delivered better absolute and risk-adjusted returns since the 2020 rule change.

But the catch is equally worthwhile. When a deep and prolonged mid- and small-cap correction eventually arrives, multi-cap managers cannot run to large caps for cover like flexi-cap managers can. That will be their real test.

Until then, investors willing to endure sharper swings for a better shot at stronger long-term returns have a solid case for multi-cap funds. Those who want a gentler ride and are okay with giving up extra returns for it will be better served by flexi caps. ☑

Old risks, new enthusiasm

PSU banks have roared back. But years of patchy returns warrant caution.

By Abhishek Rana

Public sector banks are having their moment in the sun. After years of being the sector that investors stayed clear of, they are suddenly back in vogue. Returns have been strong, headlines have been flattering and enthusiasm is running high.

But before you get carried away, it is worth asking a question that is easily overlooked when a sector is hot: what does the long-term picture actually look like?

Recent numbers look quite impressive

Let us start with the good news. In the one year ending March 30, 2026, the Nifty PSU Bank index has rallied nearly 33 per cent. In comparison, the Nifty 500, proxy for the broader market, returned -2.9 per cent.

Stretch it to five years and the staggering outperformance remains. The PSU bank index has grown nearly 32 per cent annually against the broader index's 11.9 per cent.

These are strong numbers no doubt, especially at a time when most broad market indices have been flat or in the red. Looking at them alone will have you thinking that PSU banks are one of the finest investment ideas in the market right now. But data has a habit of telling very different stories depending on how far back you look.

The long-term record tells a humbling story

Zoom out and the picture changes

More cycles lost than won

The PSU bank index has lagged the Nifty 500 over 70 per cent of the time

Narrowing the bad loan gap

PSU banks have cleaned up and nearly caught up with private peers

dramatically. We looked at the five-year rolling returns of the Nifty PSU bank index starting all the way

back from 2011 and compared them against the Nifty 500.

Profitability lost and found

From red to respectable, PSU bank ROEs have staged a strong comeback

ended up with dull returns even after staying invested for five full years and even lost money in many periods. The recent outperformance therefore proves to be a relatively recent phase in an otherwise prolonged period of lag. See graph 'More cycles lost than won' on the previous page.

What went wrong and what changed?

PSU banks spent much of the past decade grappling with bad loans or NPAs (also known as non-performing assets). Aggressive lending during the mid-2000s boom backfired when growth slowed. Rising bad loans hurt profits and weakened balance sheets.

The practice of evergreening, where lenders give fresh loans to stressed borrowers to repay existing loans to avoid classifying them as bad debt, meant the problem festered for years.

The turnaround came from regulatory force and policy intent. The Reserve Bank of India's asset quality review in 2015 forced honest recognition of stressed loans. This alongside the Insolvency and Bankruptcy Code

gave banks legal teeth to recover dues. Weaker PSU banks were merged into stronger ones to reduce fragility across the system. These efforts paid off.

By March 2025, the sector's median gross NPA had fallen from a peak of 16.4 per cent in 2018 to nearly 3 per cent, closing the gap with private banks at 1.9 per cent.

The median return on equity, which measures how much profit a bank generates for every rupee of shareholder capital was severely negative around 2018. It has since recovered meaningfully to over 15 per cent.

As the clean-up became hard to ignore, valuations that had stayed depressed for years gave way to a re-rating and stock prices followed. This recent comeback is real. But it is still in many ways a recovery from a very low base.

Why we still urge caution

The clean-up is genuine but several structural risks remain and they are worth understanding before you act.

Outperformance runs in cycles. The long-term data makes this plain. PSU banks, and related sectoral funds for that matter, shine in

specific windows typically when credit cycles recover or valuations are beaten down to near-distress levels. Outside those windows, they have consistently lagged for long periods of time.

The deep value argument no

longer holds. Between 2020 and 2023, PSU banks traded at an average price-to-book (P/B) of just 0.7, below the accounting value of their assets.

That scepticism is now largely gone with the average P/B re-rated to around 1.3 times. Much of the easy gain has already been made. The risk-reward today is meaningfully different from what it was two years ago.

Economic health remains the real

driver. PSU banks' growth and health is tied to how the economy performs. A slowdown leads to borrower repayments slipping and also softens credit growth. The hard-won improvement in asset quality, while real, is not immune to another possible downturn.

High concentration. Taking exposure to the sector comes with high concentration risk.

Nearly one-third of the PSU bank index is made up of one stock alone, SBI.

What you should do

- ▶ For most investors, a diversified portfolio that invests in flexi-cap and multi-cap funds remains the sound choice.
- ▶ If you still believe in the PSU bank story, keep it as a satellite allocation of at least 5 per cent—enough to benefit if the rally continues, not enough to hurt significantly if it doesn't. ☑

Each time my income grew, I made sure my SIP grew along with it

A small habit that could aid an investor's compounding journey

I remember the day my first salary came in. I was twenty-three, freshly employed, and for the first time, money was flowing in rather than out. Rent, commute, groceries, the occasional dinner with friends, all had their claims on it. But after everything, some amount still remained. Not much, just enough to make a small choice.

A colleague, a few years senior, gave me advice I almost ignored. “Start a SIP with whatever you can. And when your salary goes up, increase it before you get used to the extra.” Simple enough to brush off, but sensible enough to stick. I started with ₹3,000 a month.

My first appraisal came about a year later, a raise of roughly ₹8,000 a month. The thought of a better phone or a weekend trip crossed my mind briefly. Instead, I raised the SIP by ₹2,500 that same week. My lifestyle barely noticed. Within a month, I had settled into the new take-home pay just fine.

That became my system. Every appraisal, the SIP went up first, but not by the full raise, because I didn't want to feel like I was punishing myself. A portion stayed in my account for lifestyle spending. But a meaningful share moved into investments before my habits could absorb it.

Aprajita Anushree/AI-generated image

Increments grew over the years, and the SIP followed. What started at ₹3,000 had reached ₹25,000 a month by my mid-thirties. No grand plan behind it, just one habit repeated across every appraisal cycle.

The strangest part was how normal it all felt. No sacrifice, no sense of missing out. Life had improved, just not in step with every rupee earned. The rest had been compounding steadily in the background.

When I reviewed my portfolio a

decade in, the number took a moment to sink in. No windfall, no big bet. Just the result of habit and time.

Conclusion

Lifestyle inflation is one of the easiest traps in personal finance. Expenses tend to rise with income, and before long, every increment feels spoken for before it even arrives.

Stepping up a SIP with every raise tackles this directly. The amount is committed before spending adjusts, so the habit sustains itself with very little effort. Over time, each increment adds to a growing base, and compounding works on more than just the original sum.

The earlier this pattern starts, the longer compounding has to do its work. Across a career, that difference is rarely small. 

Key takeaways

- Step up your SIP with every salary raise
- Lifestyle inflation is quiet, but compounding is louder
- The earlier you start, the harder compounding works

Mutual Fund investors need to complete the Know Your Customer (KYC) process, which can be done by submitting completed KYC Form along with the required documents at any AMC's branch Office or Official Points of Acceptance. Please refer <https://www.licmf.com/kyc-redressal> to know about KYC documentary requirement, procedure for change of address, phone number, bank details etc. The investors are cautioned to invest only with SEBI registered Mutual Funds, the details of which can be verified on SEBI's website under 'Intermediaries / Market Infrastructure Institutions' (<https://www.sebi.gov.in/intermediaries.html>.) For any complaints and grievance redressal, investors can contact the Investor Relations Officer of the respective AMC and if not satisfied with the resolution given by the AMC, he/she can approach SEBI by registering the complaint on SEBI SCORES Portal (<https://scores.sebi.gov.in/>) and/or escalate the complaint through Online Dispute Resolution Portal (<https://smartodr.in/login>).

MUTUAL FUND INVESTMENTS ARE SUBJECT TO MARKET RISKS, READ ALL SCHEME RELATED DOCUMENTS CAREFULLY.

[COVER STORY]

ONE FUND for all seasons

By Pranit Mathur

Something has been happening in Indian markets over the past few months that tells you everything about how investors actually behave versus how they imagine they behave.

Through the first quarter of 2026, markets lurched with remarkable unpredictability. Geopolitical tensions sent oil prices into their own orbit and equities out of theirs.

Amidst this turmoil, India's domestic investors found a new favourite: Multi-Asset Allocation Funds, or MAAFs. A category that promises a bite of every important dish you need for a balanced portfolio, with at least 10 per cent exposure each to equity, debt, and commodities.

The category received its highest-ever monthly inflow in January 2026 at ₹10,485 crore. Over the 12 months through February 2026, it accumulated ₹61,666 crore, a massive jump of ₹25,869 crore over the previous year.

But this sudden rush into MAAFs tells you less about the category and more about investors. MAAFs are designed to be an all-weather solution. The irony is that they find their spotlight only when the weather turns rough.

An all-weather solution, noticed only in bad weather

Investors have not suddenly woken up to the importance of asset allocation. What has happened is simpler: equities have turned weak, gold has surged, and because gold is a core component of MAAFs, the category is riding that wave. Gold ETFs pulled in over ₹21,000 crore in January 2026 alone. MAAFs recorded their highest-ever inflow the same month. That is not a coincidence. That is recency bias playing out in plain sight.

No asset stays on top

Same assets with opposite stories depending on when you arrived

Period	Return (% p.a.)		
	Equity	Debt	Gold
Optimistic markets			
Mar-09 to Mar-15	25.3 	8.6 	1.3 
Feb-16 to Aug-18	25.9 	7.1 	1.9 
Oct-18 to Jan-20	16.3 	5.7 	19.9 
Mar-20 to Oct-21	82.6 	8.0 	9.6 
Jun-22 to Sep-24	32.6 	7.0 	17.6 

Period	Return (%)		
	Equity	Debt	Gold
Pessimistic markets			
Mar-15 to Feb-16	-20.7 	6.6 	9.9 
Aug-18 to Oct-18	-15.6 	0.5 	5.9 
Jan-20 to Mar-20	-36.5 	-0.6 	1.5 
Oct-21 to Jun-22	-18.3 	1.3 	7.7 
Sep-24 to Feb-25	-19.1 	2.7 	12.4 

Optimistic markets were periods from Nifty 500 TRI's trough to peak; pessimistic markets were periods from peak to trough (based on an atleast 15 per cent fall). Equity returns were derived from Nifty 500 TRI, debt returns from an average short-duration debt fund, and gold returns from domestic gold prices.

The deeper problem with this behaviour is timing. Investors do not run for cover before the storm reaches the shore. They run after it has already arrived, after the damage to their portfolio is done. And that is how their portfolio allocation math turns out wrong.

Investors get asset allocation wrong, consistently

There are two mistakes investors make with remarkable regularity. The first is chasing whatever has just worked and dismissing whatever has not. The table 'No asset stays on top'

Illustrations: Anand Kumar

illustrates this well. In the sharpest bull runs—March 2009 to March 2015 and March 2020 to October 2021—equity delivered 25.3 and 82.6 per cent per annum respectively. Gold returned 1.3 and 9.6 per cent per annum. The gap was so wide that holding anything other than equity would have felt like a poor decision.

Every single pessimistic period tells the opposite story. Between March 2015 to February 2016, equity was down 21 per cent with gold up almost 10 per cent. When equity stumbled during the pandemic crash, gold and debt were the only anchors.

In bull markets, equity looks so compelling that debt and gold seem ignorable. In crashes, equity looks so risky that gold and debt feel indispensable. Investors swing between these views, forgetting the last each time. Because asset allocation isn't treated as a

Returns lead. Investors follow

Inflows followed the curve up. They did not lead it.

Returns based on Nifty 500 TRI. Netflows data from AMFI.

Late to gold, as always

Gold's rally ran for two years before inflows exploded

Returns based on gold prices. Netflows data from AMFI.

permanent discipline, something to maintain from the start, every market shift catches portfolios unprepared.

The allocation decision, in practice, is almost never forward-looking. With extraordinary consistency, it is a rear-view mirror reading of whatever just happened.

The rush into whatever has worked recently leads to the second mistake: arriving too late. Between June 2022 and September 2024, the Nifty 500 TRI delivered over 80 per cent in cumulative returns. Monthly net flows into equity funds marched upward in lockstep, from around ₹15,000 crore to over ₹36,000 crore a month. The money did not lead the rally. It followed it with each rupee arriving later and at a higher price than the one before. See chart: Returns lead.

Investors follow.

The bigger problem is that this enthusiasm does not last. As a correction followed, most investors did not wait it out. They left to chase whichever asset had just turned comforting. That was gold, which had returned over 150 per cent between January 2024 and February 2026. The inflows followed that curve too. See chart: Late to gold, as always.

This constant movement in and out, driven entirely by what markets have just done, is what damages returns and leaves portfolios permanently unsteady. Getting the timing right on your own is hard. Getting the allocation right on your own, and then holding it through volatility, is harder still.

This is where MAAFs make sense

A MAAF takes the DIY problem off the table. It maintains allocation across equity, debt, and commodities (typically gold, silver) not when sentiment demands it but continuously as a structural discipline. The current surge in MAAF flows may well fade when equities recover and gold loses its shine. Hot money is not loyal. But that would be the market's irrationality at work, not a verdict on the category.

MAAFs are genuinely useful, not as a shelter from a specific storm but as part of a portfolio built to withstand any weather. Their typical structure makes that clear. The average fund in the category as of February 2026 held 54 per cent in net equity, 22 per cent in debt, 15 per cent in commodities, predominantly gold and silver, and 9 per cent in cash. The average fund therefore offers growth from equity, stability from debt, an inflation hedge from gold and a liquidity buffer in cash.

For an investor who would

The full portfolio in one 'thaali'

An average MAAF delivers diversification most investors find difficult to achieve on their own

As per February 28, 2026 disclosures. Based on the allocation of an average fund as per Value Research classification.

otherwise spend considerable energy deciding how much to put where, rebalancing periodically, and then typically abandoning that exercise during volatile markets, this structure has real value.

There is also a tax advantage. When the fund manager rebalances internally, selling equity to buy gold, or shifting from gold to debt, no capital gains event is triggered for the investor. If that same investor were managing three separate funds and rebalancing manually, every switch would be a taxable transaction. Over a decade, this structural efficiency compounds into a difference that discipline alone cannot replicate.

In simple terms, a MAAF is the financial equivalent of a well-assembled thali. It may not have the finest individual dish but it has something from every essential group on one plate, assembled thoughtfully, and it will not leave you hungry or unwell.

The problem however is that not every thali in this category is assembled the same way. Between the category's promise and what investors actually hold lies a gap wide enough to produce very different outcomes. And that makes choosing the right fund difficult.

No two MAAFs are the same

The MAAF space is wider than most investors realise. It helps to understand it along two lines: by structure and by allocation.

One label. Four structures

Behind the MAAF label sits a universe of different fund types

Based on funds nomenclature as of Mar 31, 2026.

By structure. Of the 51 funds active (as of March 31, 2026) in this space, 34 are standard MAAFs that invest directly in securities, five are Active FoFs (which invest in other active mutual fund schemes), six are Omni FoFs (a mix of active and passive underlying schemes), and six are pure Passive FoFs.

By allocation, where the real story begins. AMFI's naming convention tells you a category. What it does not tell you is the risk profile within that category and this is where investors are most commonly surprised, usually at an inconvenient moment.

A MAAF can, by the letter of SEBI's rules, hold anywhere from 10 per cent to well over 70 per cent in gross equity. The rule merely requires that at least three asset classes each receive a minimum 10 per cent gross allocation. For those unfamiliar with the distinction: gross equity accounts for all long and short strategies, while net equity is the actual market exposure after netting off hedged positions, the number that will move your portfolio's needle in the long run.

The distance between a fund sitting at 20 per cent net equity and

one at 70 per cent is the difference between a portfolio that behaves like a conservative income product and one that behaves like an aggressive hybrid fund. Both carry the MAAF label. This is the hidden problem with the average allocation figure that AMC's and investment platforms routinely use to sell the category. That figure is accurate and simultaneously misleading, the most dangerous kind of accurate.

Take the example of the US Air Force. In the 1950s, the Air Force measured over four thousand pilots across nearly a dozen physical dimensions and redesigned their cockpits to fit the average. The result was embarrassing: not a single pilot matched that average. Every pilot had what researchers called a jagged profile, long legs but short arms, large chest but small head. The cockpits built for the average pilot fit nobody at all.

The average MAAF allocation is a similar fiction. It describes the category, but no fund within it. Inside that tidy average are funds with 30 per cent net equity and others with 70 per cent, some that behaved like conservative income products during the Covid crash and

The categories within the category

Five distinct risk profiles sit underneath the single MAAF label

Classification of funds based on net equity exposure range from May 2018 to February 2026.

[COVER STORY]

others that fell almost as much as the Nifty 500.

How we sorted the category

To make sense of the category on investors' terms, rather than AMFI's nomenclature, we classified MAAFs with sufficient operating history into five buckets based on their sustained net equity posture over time.

We started with all 51 currently active MAAF funds and applied a minimum one-year history filter, also excluding each fund's first five months of portfolio data. Fund managers typically spend those early months building toward their intended allocation rather than running it. The sixth month onward is when a portfolio reflects a deliberate choice.

This brought the working universe

to 38 funds, with data running from May 2018 to February 2026. Classification was based on net equity exposure (gross equity minus hedged and arbitrage positions), observed monthly. A fund was assigned to a bucket if it spent at least 50 per cent of its observed months within that bucket's net equity range:

Conservative: Net equity below 35 per cent

Moderate: 35 to 50 per cent

Aggressive: 50 to 65 per cent

Very aggressive: Above 65 per cent

Dynamic: Swinging too widely to settle in any single bucket

Conservative MAAF funds maintained a median net equity allocation of around 21 per cent. Moderate funds clustered around 43.7 per cent. The Aggressive bucket, where most of the funds sat, had almost 59 per cent. Very aggressive funds, nine of them, maintained a median around 68 per cent, placing them squarely in aggressive hybrid territory, with gold added on top. And two funds proved genuinely Dynamic, oscillating between 29.9 and

How your MAAF is taxed

- Tax treatment depends on each fund's average gross equity allocation over the preceding 12 months and varies from fund to fund.
- Most MAAFs keep gross equity above 35 per cent, qualifying investors for equity-like taxation after two years of holding.
- In the Aggressive and Very Aggressive buckets, where gross equity can exceed 65 per cent, equity taxation after one year can become a possibility.
- For long-term investors, hold for two years or more, and the tax question largely resolves itself. Focus instead on choosing the right bucket.

67.3 per cent net equity without settling into any consistent posture. See table: Same category, very different portfolios.

An investor choosing a Very aggressive fund is, in most conditions, running equity similar to an aggressive hybrid, with a gold overlay. A conservative bucket investor holds something closer to an equity savings fund with a more generous commodities allocation. These are very different, yet the MAAF label does not distinguish between them at purchase.

Same category, very different portfolios

Strip away the MAAF label and this is the equity risk you actually run

Classification based on net equity exposure from May 2018 to February 2026. IQR i.e. interquartile range shows the range within which each bucket spent most of its time; the tighter the range, the more consistent the fund's equity allocation.

Does gold earn its keep?

Before recommending which bucket suits which investor, it is worth asking whether the gold component inside a MAAF actually does what it promises. The latest five-year picture looks compelling. Gold has returned 25 per cent per annum, ahead of every major broad-based equity

index. But gold's history over longer periods is more complicated.

Considering the period since the Sensex launched in 1979, there have been multiple instances when gold went through extended stretches of flat or even declining real returns. Between 1982 and 2001, nearly two decades, gold delivered roughly 5.8 per cent annualised returns, well below the Sensex's 14.2 per cent.

Between 2013 and 2019, gold returned a little over 3.1 per cent per annum, again trailing equity's 11.2 per cent by a significant margin. The Sensex, since inception, has compounded at roughly 14 to 15 per cent per annum. Gold over the same stretch has underperformed substantially.

What gold reliably delivers is not return enhancement but return stabilisation. Its low or negative correlation with equity, demonstrated clearly across the five market crashes since May 2018, where gold posted positive returns each time equity fell sharply, is the actual argument for its presence in a portfolio.

Think of the gold allocation in a MAAF as insurance, not return. That framing changes what you should expect from it and whether you will hold the fund when gold eventually goes quiet.

The recent gold rally has been exceptional by any historical measure. Building a portfolio assumption around its continuation is a risk, not a plan.

Investors entering MAAFs today because gold has returned 25 per cent per annum over five years are making the same error that equity investors made in early 2008: buying the trailing return, not the asset's logic. That distinction matters for how long an investor will hold a MAAF fund and whether they will be there when the

Where does your MAAF stand?

Only funds that were atleast one-year old by March 31, 2026 were considered. Net-equity exposure is averaged across portfolio disclosures till February 28, 2026. Fund classification is based on our in-house model. NOTE - These are not our recommendations.

The other side of the gold story

The recent gold rally is exceptional, but history urges caution

category's diversification properties actually pay off.

Measuring MAAFs against their true peers

Each MAAF bucket should be compared against a hybrid category carrying similar net equity exposure to ensure a like-for-like comparison.

Conservative MAAF vs equity savings and conservative hybrid funds. Conservative MAAFs underperformed equity savings funds in strong bullish years but outperformed in consolidation and stress periods. Across calendar years 2019 through April 7, 2026, conservative MAAFs beat their

peers in five out of eight years while carrying broadly similar equity risk. The gold component was the difference.

Moderate MAAF vs dynamic asset allocation funds. Moderate MAAFs slightly underperformed in equity's strongest years but outperformed during bearish phases, finishing ahead in five of eight years against dynamic asset allocation funds, or balanced advantage funds. The pattern confirms that the gold overlay consistently earns its keep in volatile and declining market conditions.

Aggressive MAAF vs aggressive hybrid funds. This is the category's clearest result. Despite less net equity, aggressive MAAFs outperformed aggressive hybrid funds in 6 of the 8 years observed. The gold component cushioned corrections without materially dragging bull-market returns. This is

the bucket where the MAAF structure earns its strongest case.

Very aggressive MAAF vs aggressive hybrid funds. The edge largely disappears at this level. Against aggressive hybrid funds, very aggressive MAAFs won in only 4 of 8 years. At roughly 68 per cent net equity, the gold allocation is too small a share of the portfolio to provide meaningful cushioning, and the fund behaves predominantly like an aggressive hybrid with a modest overlay.

Performance through corrections. In March 2020, when the Nifty 500 TRI fell 24 per cent, aggressive MAAFs fell 16.7 per cent, moderate MAAFs fell 9.9 per cent and conservative MAAFs fell 7.4 per cent, all considerably less than the 18.6 per cent decline in aggressive hybrid funds. In March 2026, which saw a sharp 11.4 per cent equity fall, the same pattern held across every bucket. The trade-off is consistent: MAAF buckets perform well in sideways and declining markets at the modest cost of slightly underperforming in strongly bullish ones. This makes them well-suited to investors prone to panic exits because the portfolio cushions the very events that typically trigger them.

Which bucket is right for you?

Conservative MAAF. Suitable for investors who are new to market-linked products, who are risk-averse, who have a two-to-three-year horizon.

An honest note on our analysis

The MAAF category only began operating at meaningful scale from May 2018. Eight years of data is sufficient to be directional. It is not sufficient to be definitive. We have used calendar-year returns rather than rolling returns precisely because rolling return analysis requires a longer history to be statistically robust. Thus, conclusions in this story should be read accordingly.

Mapping returns of the MAAF buckets

At low equity, gold made the difference

Despite struggling in equity-dominant years, conservative MAAF beat the others in most years

The gold overlay earned its keep

Moderate MAAFs beat balanced advantage funds in 5 out of 8 years

Aggression has a limit

Push net equity past 65 per cent and the MAAF advantage seemingly disappears

Average fund considered. Categorisation as per net-equity exposure for MAAF and as per Value Research for other categories. *Data till April 7, 2026 considered.

At roughly 21 per cent net equity, this is a meaningful upgrade from a pure debt fund and with gold adding resilience that pure debt cannot provide. However, the net-equity

structure of the class lacks the ability to aid long-term wealth creation.

Moderate MAAF. The most balanced entry point for investors who want meaningful equity participation

without the full volatility of a predominantly equity portfolio. Its track record against balanced advantage funds, outperforming in five of eight years, makes it a credible core holding for investors with a three-to-five-year horizon who have not yet developed the conviction to hold through sharp corrections.

Aggressive MAAF. The category's most attractive proposition and data supports that view most clearly. At roughly 58 per cent net equity, it offers aggressive hybrid-like growth with meaningfully better downside protection than pure aggressive hybrid funds, outperforming in six of the eight years observed. The right choice for investors who want equity as the primary return driver but want the gold allocation to function as genuine insurance against extreme corrections.

Very aggressive MAAF. Offers the thinnest case. At roughly 68 per cent net equity, the gold allocation is too small to provide the downside protection that makes the category compelling. Funds in this bucket have not outperformed aggressive hybrid peers with sufficient consistency to justify the added complexity. Investors here are generally better served by an aggressive hybrid fund with a separate, smaller gold ETF allocation.

Dynamic MAAF. Not recommended. The fund manager's discretion to swing net equity across a 40-percentage-point range means the investor has no reliable way to assess what they hold at any given time or how it will behave.

A record of five wins in eight years does not compensate for that structural unpredictability.

Final takeaway

What MAAFs offer is not guaranteed superior returns. What

When equity fell, MAAF held

Across five sharp equity falls since May 2018, the MAAF cushion showed up every time

Category	Worst months for equity (%)				
	Mar 2020	Mar 2026	Sep 2018	Feb 2025	Oct 2024

Categorisation as per net-equity exposure for MAAF and as per Value Research for other categories.

they offer is something more durable: a structure that makes it considerably harder to make the allocation mistakes that cost most investors their long-run wealth.

The investor who panics out of equity at the bottom of a correction and rushes into gold at the top of a rally has not lost money because

markets are hostile. They have lost money because the structure of their portfolio gave them no buffer between their worst impulses and their investment outcomes. A well-chosen MAAF, specifically from the conservative, moderate, or aggressive bucket, puts gold inside the portfolio rather than outside it,

making it a constant stabiliser rather than the next asset to chase.

In a market where the biggest financial risk is not volatility itself but investor behaviour in response to it, that structural discipline is worth considerably more than most return comparisons suggest.

Choose a bucket. Then stay in it. ☒

Know your bucket before you invest

MAAFs work but only if you choose the bucket that matches who you actually are

Conservative

Takeaway: Cushions downturns well but grows too slowly for long-term wealth creation

Suitable for: Risk-averse investors with a two-to-three-year horizon who prioritise capital protection over returns

Moderate

Takeaway: Meaningful upside with lower volatility than DAAF*

Suitable for: Beginner investors entering the market for the first time with a three-to-five-year horizon

Aggressive

Takeaway: Near-identical returns to an aggressive hybrid fund, with significantly less risk

Suitable for: Longer-term investors with a five-to-seven-year horizon who want equity-like growth but lack market experience

Very aggressive

Takeaway: No meaningful advantage over a simpler aggressive hybrid fund

Suitable for: Not recommended

Dynamic

Takeaway: Too much flexibility obscures what you hold and how your portfolio behaves

Suitable for: Not recommended

*DAAF is dynamic asset allocation funds

Kotak Flexicap Fund

It invests flexibly across large, mid, and small cap stocks.

Trusted for *15+ years*

‘We assign relatively higher weight to momentum’

Jain says momentum has ranked at the top in 14 of the last 15 years

At a time when markets are swinging between geopolitical shocks and compressed returns, Bhavesh Jain is focused on consistency rather than chasing standout years. The Co-head of factor investing at Edelweiss Mutual Fund, who has over 16 years of experience and oversees hybrid strategies such as the Balanced Advantage and Arbitrage funds, believes disciplined, risk-aware investing delivers better outcomes than sporadic outperformance. His approach combines conservative portfolio construction with a structured, multi-factor framework

that adapts across market cycles.

In this conversation, Jain explains why staying in the top half of the performance table matters more than topping it, how factor investing helps navigate shifting market regimes and why corrections are the most powerful phases for long-term investors.

The record of never receiving a rating below 4 stars is genuinely rare. What sits at the core of your stock selection framework?

Winning the Morningstar Best Manager Award consecutively, and

being the first AMC outside the

top 10 to do so.

Several layers drive this. We maintain a conservative equity portfolio in mandates like the BAF (balanced advantage fund) or aggressive hybrid fund; there's a consistent large-cap bias. On fixed income, both funds carry nearly 100 per cent allocation to AAA-rated securities, G-secs and T-bills. No credit risk, no duration stretch beyond 3-5 years.

We also avoid large overweight or underweight sector bets, preferring granular deviations. We're style-

agnostic and benchmark-aware.

Within the AMC, we maintain two distinct equity teams—Trideep Bhattacharya leads fundamental long-only strategies (mid, small, flexi, focused), while Bharat Lahoti and I co-head hybrid funds under the factor investing team.

The Sensex's five-year return has compressed to around 8 per cent per annum. Are you in capital preservation mode or hunting for opportunities?

The last two years have been largely flat, compressing the three-, five- and seven-year return optics. Valuations were stretched coming out of the 2023-24 bull run, and global events—Russia-Ukraine, US-China tensions, Middle East escalation—added to uncertainty.

That said, meaningful correction has already happened. Historically, corrections rarely stretch beyond 18-24 months. We've had close to 24 months of negligible returns, making valuations far more reasonable—not cheap, but comfortable.

The near-term, say two to three months, remains difficult to call. Geopolitics is unpredictable, and markets are swinging 5-10 per cent on news flows. But from a three- to five-year perspective, risk-reward is clearly improving.

Recoveries from global-driven corrections tend to be sharp. In 2008, markets fell around 50 per cent and rose around 75 per cent in 2009. After the 25 per cent decline in 2011, markets gained around 27 per cent in 2012. Once geopolitical tensions ease, a similar response is plausible.

We've been cautious for 18 months due to stretched valuations and mid/small-cap excess. Much of that froth has come off. Investors

can start allocating with a three- to five-year lens—not timing the bottom, but recognising the improving risk-reward.

What's your honest advice to a retail investor seeing flat or negative SIP returns?

SIP's whole purpose is discipline. You don't know where the top or bottom is, and you shouldn't try to predict it. Corrections, whether price or time, are when you accumulate more units at lower NAVs. That's when real wealth is built.

There's a common misconception that SIP works best in bull markets. It's the opposite. In a rising market, subsequent instalments are bought at higher valuations, reducing the benefit. Corrections are what make SIP powerful. Equity is not an 18-24-month product. SIP should have a five-year-plus horizon. Even in this challenging phase, many equity

funds have still delivered positive returns—not exceptional, but comparable to fixed income. Investors who stayed through 2008-13 or 2015-16 ultimately benefited. The same discipline applies here.

How do you think about the risk of retail patience running thin, potentially weakening DII support?

Among all asset classes—gold, silver, real estate, fixed deposits—equity remains the only avenue capable of delivering inflation-beating returns over time. Precious metals saw strong inflows followed by sharp corrections; silver fell 35-40 per cent in weeks. Real estate is illiquid. Equity, by comparison, remains more efficient.

What's encouraging is the behavioural shift among retail investors. In earlier cycles—2008, 2011, 2013—SIPs would pause during corrections. This time, despite multiple volatile episodes since Covid, SIP flows have remained resilient. We're even seeing lumpsum investment upticks during corrections.

Structurally, India remains under-invested in equities. Household savings are still skewed towards gold and other assets. Strong returns from gold and silver over the past 18-24 months have also cushioned overall investor wealth, keeping confidence intact.

As long as the overall investment experience remains positive, and once markets recover over the next 6-12 months, that reinforcement will extend investor patience further. We're not concerned about a sharp disruption in flows.

What does factor investing mean in practice, and why is it suited to India?

Factor investing is essentially a structured investment style. Traditionally, investors have followed growth or value—but those styles go through extended periods of underperformance. Value underperformed for nearly four years between 2018 and 2022; growth has seen a similar weak phase more recently.

Factor investing identifies measurable stock characteristics—valuation, momentum, quality, low volatility, beta, size—and builds portfolios around them. Even market capitalisation is a factor; smaller companies have historically outperformed larger ones over time.

What it allows is a move beyond a broad market view to focus on specific characteristics. Today, both active and passive strategies are adopting multi-factor approaches—combining several factors reduces the risk of relying on any single one and allows dynamic adjustment across market conditions.

How do you decide which factor to give prominence to? Is it systematic or discretionary?

We divide factors into two buckets: fundamental (growth, quality, value) and behavioural (momentum, low beta, volatility). We combine these to navigate bull, bear and consolidation phases.

We assign relatively higher weight to momentum as a leading indicator. The logic: what is working tends to continue working in the near term. So when value is performing, a momentum-driven portfolio naturally tilts toward value; when growth leads, it shifts accordingly.

Momentum itself has had a rough patch over the last 12-18 months. But because most portfolios follow a multi-factor approach—where momentum is one

of several factors—funds like Balanced Advantage, Aggressive Hybrid and Equity Savings have maintained consistency.

No single factor works all the time. The objective is not to chase the best-performing factor but to build a framework that delivers consistency across cycles. Success is staying in the top half of the performance universe over three to five years.

Momentum has delivered middling returns recently, yet your funds have remained resilient. Is the Business Cycle Fund a different case?

In diversified funds like BAF or Aggressive Hybrid, we stay close to the benchmark—deviations are typically $\pm 5-7$ per cent versus index weights. The Business Cycle Fund is different: the mandate allows up to 40 per cent in a single sector, and momentum drives sectoral allocation there.

Momentum has meaningfully underperformed only twice in 15-16 years—in 2016 and 2025—both periods of sharp, India-specific disruptions (demonetisation in 2016; geopolitical and tariff-related shocks in 2025). Momentum works best in trending markets; sharp reversals caused by external events disrupt it.

But these phases have been short-lived. Post-2016, momentum bounced back strongly in 2017. In early 2026, we're already seeing recovery signals.

Across the four core factors, momentum has ranked first or second in 14 of the last 15 years. We also use it differently across strategies—for sector rotation in the Business Cycle Fund, for asset allocation in BAF, and for stock selection elsewhere. It's a versatile factor applied across multiple layers.

Would it be fair to say you use momentum to anticipate which style will be in favour?

Yes. We believe most information is already reflected in prices, which sector will outperform, and which style will lead. Following price trends and indicators more often than not guides you to the right places.

This forms the basis of our BAF hedging model, the Edelweiss Equity Health Indicator. If the market signals increasing equity exposure, we increase it; if otherwise, we reduce. We don't second-guess through valuation forecasts or geopolitical predictions. We follow the indicator with discipline.

Could you map each hybrid fund to a specific investor profile?

We frame each category around three parameters: risk, return expectation and investment horizon.

Arbitrage funds carry zero net equity exposure and act as tax-efficient alternatives to fixed income. Suitable for three months to one-and-a-half years; favoured by corporates, HNIs and investors who'd otherwise use FDs or liquid funds.

Equity savings funds carry around 25 per cent equity with the rest in arbitrage and debt. For investors who are beginning to participate in equity but are not yet comfortable with full volatility. Suitable for three years-plus with limited risk appetite.

Aggressive hybrid funds allocate around 75 per cent to equity and 25 per cent to debt. For investors who are comfortable with equity but want a volatility cushion. Over three to five years, returns are comparable to large-cap or flexi-cap funds but with lower drawdowns.

Balanced advantage and multi-asset allocation funds suit investors

unsure about asset allocation across equities, debt, gold and silver. BAFs dynamically shift between equity, arbitrage and debt; multi-asset funds extend to commodities and sometimes REITs. The model handles allocation—investors don't need to time or rebalance.

Across the spectrum, equity exposure moves from zero in arbitrage, to around 25 per cent in equity savings, around 50 per cent in BAF/multi-asset, to around 75 per cent in aggressive hybrid, with investment horizon rising correspondingly.

Omni Fund of Funds in 2025. Here we actively express views across equity (large and mid-cap biased), debt (around 15 per cent, duration adjusted to rate outlook), gold and silver (equal allocation). Within equity, we rotate across segments and themes—currently overweight financials, with exposure to thematic and IPO strategies.

On the BAF's perceived aggression: our approach is momentum-driven rather than valuation-driven. During the Covid correction, when markets fell around 40 per cent, our BAF fell

fewer than half. Selection and filtering are central.

Over time, the fund has delivered mid-teens returns (around 15-16 per cent) and outperformed its benchmark by 5-7 per cent, including through periods when the IPO market itself was weak.

Within the Omni FoF, the 5 per cent allocation serves two roles. First, it provides structured access to IPO opportunities. Second, since we don't have a meaningful small-cap allocation in the portfolio, many IPOs come from the mid- and small-cap segment—so it functions as a filtered, research-driven substitute for small-cap exposure.

We enter IPOs through anchor, main book, QIB quota or on listing day. In some cases, we revisit post-listing if valuations or fundamentals improve. All four routes are actively used.

How do you split between listing gains and core positions? What drives exits?

We enter IPOs through anchor, main book, QIB quota or on listing day. In some cases, we revisit post-listing if valuations or fundamentals improve. All four routes are actively used.

For core positions, we evaluate whether the business has secular or cyclical growth profile and size accordingly—anywhere from 50bps to 5 per cent of the portfolio depending on conviction, often built gradually after anchor lock-ins expire and initial quarterly results are visible.

For listing-driven plays, we participate where demand is strong due to valuation gaps, sector scarcity or novelty—but without long-term ownership intent. Exits are driven by stretched valuations, execution misses, better opportunities within the IPO universe, or the rule that once a stock exits the last-100 universe, we systematically trim exposure. ☑

Your BAF looks relatively aggressive, while your Multi-Asset Fund has very low equity exposure. Is this structural or tactical?

Both are by design, serving different purposes. The Multi-Asset Allocation Fund was launched in 2023 following the debt taxation change, and was consciously positioned as a multi-asset arbitrage strategy. It carries equity arbitrage, debt and commodity arbitrage (gold and silver via derivatives), no naked equity or commodity exposure. It targets stable, debt-like returns through arbitrage spreads and is built for consistency and tax efficiency, not directional participation.

For a traditional active multi-asset strategy, we introduced the

around 14 per cent, versus 27-33 per cent for several peers. The real measure isn't headline equity allocation, it's downside behaviour during stress. We're not trying to protect every 5-10 per cent correction, but to protect capital during meaningful 20-30+ per cent drawdowns while participating in upcycles.

What's the investment thesis behind the 5 per cent position in the Edelweiss Recently Listed IPO Fund within the Omni FoF?

The IPO fund operates within a defined universe—the last 100 main-board IPOs—with no compulsion to invest in all of them. Across around 300 IPOs over six years, we've participated in

‘Earnings visibility is the only margin of safety’

Devender Singhal on favouring large caps for earnings visibility

After 18 months of volatile markets and tempered returns, Devender Singhal believes investors are finally seeing what a “normal” market looks like. The fund manager at Kotak Mutual Fund, who oversees six schemes with assets of nearly ₹52,092 crore, argues that earnings visibility, not valuation comfort, is the true margin of safety in uncertain times. He has tilted portfolios towards large caps and sectors with clearer growth trajectories, while remaining anchored to Kotak’s philosophy of growth at a reasonable price.

In this conversation, Singhal

explains why value investing rarely works in isolation, how opportunities are emerging selectively across market caps, and why investors must reset return expectations and stay invested through cycles.

In volatile markets like the one we are currently in, how are you structuring your flagship multi-cap portfolio? Are you looking at a massive restructuring?

Volatility has been in the market since September 2024, when markets went down sharply. Then, post-March 2025, we saw a relief rally too. And since then, the market has generally

been on a downward trend. The velocity on the downside has actually accelerated since February this year, when the US-Iran crisis surfaced.

Right now, we have been positioning our portfolios more towards large caps and sectors with higher growth visibility. In this kind of market, earnings visibility is the only margin of safety you have. Obviously, there are efforts to buy stocks at reasonable prices,

At Kotak, ‘growth at a reasonable price’ is the mantra and the investment philosophy. So we try to do that as much as possible. Wherever we found earnings visibility

to be fairly high and valuations reasonable, we have tilted up positions over the last 6-12 months. In recent times, based on what has happened in the market, particularly sharp spikes in crude oil, we have tinkered with some positions, not significantly, by getting into sectors which are more positively aligned to oil movements.

So, you are restricting your positions. You are taking positions to manage risk, but are you also looking at value investing?

Value investing in India does not work too much, at least not in isolation. It starts working only when the perception around those value names begins to change, either towards becoming growth stocks or when earnings growth starts accelerating. When the market starts seeing a transition from a value zone to a growth zone, that is when it plays out.

We are quite cognizant of that and have learned this the hard way. So, we would prefer reasonably priced names, but growth has to be there. Even if not immediately, over the next few quarters, earnings for those names should pick up.

In our earlier interaction, you mentioned that mid- and small-cap valuations were elevated but justified by earnings growth over a 3-5-year horizon. Since then, we've seen a meaningful correction, especially in small caps. How do you assess valuations now? Have prices corrected in line with earnings expectations, or do you still see pockets of excess?

If you look at a 3-5-year horizon from where we were in October 2024, which was basically the last market

peak, we have seen fairly sharp drawdowns since then. But if you look at valuations and earnings growth, they have actually kept pace. In fact, in some pockets, earnings growth has even accelerated.

So, we continue to maintain that as we go forward, as long as earnings continue to be delivered. The valuations have now become much more reasonable. In fact, in certain pockets, particularly large caps, we are close to Covid levels. So definitely, there is value emerging in parts of the market, especially in large caps. I may not say the same to that extent for mid-caps and small caps, despite the correction.

That said, on a bottom-up basis, we are finding many ideas that merit inclusion in the portfolio if you take a three-year out view. When we look at mid-caps and small caps, we ideally seek opportunities where money can double over the next few years. And

currently, we are finding such ideas. I am not saying that there may not be further downside before the up move, but you cannot wait for the last 10-15 per cent correction and miss out on the larger opportunity when you are seeing a strong upside over a three-year horizon.

So, if you have a 3-5-year horizon, this is a market that offers a lot of opportunities across market caps, more so in large caps, some in mid caps, and within small caps, given the breadth of the universe. While the broader market may not show it clearly, when you deep-dive, many names are emerging on the investment radar.

Drawing on our past interaction, you positioned your portfolios for consumption recovery based on improving rural demand. But since mid-2025, you have significantly tapered your Consumer Discretionary allocations. Are you seeing signs of a slowdown in this sector?

The names we had in the consumer discretionary space: there has been no material change in the demand environment; it continues to hold up reasonably well. However, within segments like quick commerce, where we had relatively higher exposure, we have seen competitive intensity increase. That has led to some derating in multiples.

That said, we remain positive on the overall space. Globally, this is a consolidated market. Still, during high-growth phases, increased competition can put pressure on profitability, and that is exactly what the sector is currently witnessing. The fear of a third or fourth player entering with aggressive pricing is also holding back incumbents from fully exercising their pricing power.

So, while our stance remains

constructive, we are closely monitoring how competitive intensity evolves. We still maintain a decent exposure, but if we start seeing signs of competition easing, we would be among the first to increase our allocation to the space.

At the same time, consumption as a theme has held up quite well, whether in quick commerce, services, liquor or broader discretionary. These areas have performed well over the last one-and-a-half years since we last spoke.

You have an NFO going on for a multi-asset active FoF. Since you already have two funds within the multi-asset space, i.e., a multi-asset allocation hybrid fund and a multi-asset omni FoF, how is this one different from them? Also, why bring in another fund in the same space when there are already two?

You are right that we already have two products in the multi-asset space. In fact, our first product, the multi-asset omni FoF, is one of the oldest on the market. We have been in business for more than 22 years, and we have done phenomenally well in terms of alpha generation. In fact, the very reason we launched another hybrid product, another multi-asset structure, was that the performance track record of this FoF has been strong. Still, with the tax law changes, it became unfavourable from a taxation standpoint. So we launched a more tax-friendly version two years back.

If you look at the multi-asset FoF, it can serve as a one-stop solution for a retail investor or an HNI (high-net-worth individual) who wants to diversify their portfolio while having a professional manager oversee it. We have done a good job on that front. However, the feedback we

received was that there could be a structure that allows you not to be restricted to just Kotak Mutual Fund, but also to include funds from other fund houses.

So, considering that, we are now launching the multi-asset allocation active FoF, essentially taking the two-decade-old product into a new avatar. It will have features similar to the existing FoF, but with two key differences. First, it will be a multi-manager structure, meaning it will include funds from Kotak Mutual Fund and other AMCs. That is one big change.

Second, it will invest only in active funds. In the earlier FoF, we could have a mix of passive and active strategies. Here, on the equity and debt side, we will only use active funds. For commodity exposure, we will use ETFs rather than active strategies.

So, the idea is to build a portfolio that has the potential to generate alpha over and above the benchmark through active fund selection, while also benefiting from a broader opportunity set across fund houses. That is where the key differentiation lies.

Gold investors feel betrayed after what happened in March. Gold is supposed to hedge your equity risk, but this time it fell with it. While running a multi-asset strategy, did you foresee this happening? How did you manage this situation?

I really do not agree with the statement that gold has betrayed investors. Over the last year, it has delivered phenomenal returns. We all know the kind of returns gold and silver have given over this period.

When we talk about multi-asset investing, it is not about assets moving in opposite directions at all

times. Over shorter periods, correlations can turn positive, and assets can move together. What matters is that over a longer period, the correlation between asset classes tends to be low or sometimes even negative. That is where diversification benefits come in.

So multi-asset investing should be seen as a shock absorber. It is not a guarantee that one asset will always go up when another falls. But over time, it helps ensure the portfolio does not become overly directional or volatile when one asset class underperforms.

From a view perspective, on gold and silver, when global volatility increases and confidence in the dollar weakens, investors tend to move towards precious metals. In fact, central banks have continued to accumulate gold. At the same time, with the sharp move in crude prices, oil in gold terms became relatively cheaper, leading to some reallocation and a short-term correction in gold and silver, more so in silver.

But from a medium- to long-term perspective, the trend remains favourable for precious metals, and we maintain a positive view on both gold and silver.

How do you use the 20 per cent leeway outside the mandate of thematic funds? Do you look for sectors/stocks/assets to cushion blows or optimise for growth by borrowing stock ideas from your other successful portfolios?

Whenever you are managing a thematic portfolio, you need to understand why the investor is coming to you. The investor is seeking exposure to that specific sector because they have a particular view of it. Going beyond that and allocating to unrelated sectors or stocks makes little sense.

While the flexibility exists, it is meant for rare situations, either when you need to cushion the portfolio during adverse conditions or when there is a truly compelling opportunity outside the theme. But ideally, we do not prefer to use that leeway. We have consciously restrained ourselves to remain sector-focused.

We already have a sufficiently large universe of stocks within the defined theme to work with. There is no point, for example, in holding IT stocks within a consumption

Investors who have been in the market for, let's say, one to one-and-a-half years have continued their SIPs, but are now seeing their portfolios deliver returns of barely 1-2 per cent, or even negative returns. So, for them, how would the next two to three years look?

Unfortunately, investors who have come in over the last five years, and were not there before that, have seen only one phase of the market, which was a very sharp uptick. There were very brief corrections, and the

The last 18 months have reinforced that markets are not meant for quick gains. They do not move in one direction at all times. Corrections of 10-30 per cent are very normal over longer periods.

fund, which defeats the purpose. Even within consumption, while one could argue that financial services like AMC's or broking platforms are consumer-facing, we have chosen not to include them.

The sector universe is reasonably well-defined by SEBI, and we prefer to stay aligned with it. While diversifying outside the theme may seem like a good risk-management strategy today, it may not be so effective in the future. When the sector performs well, the investor may feel shortchanged for not receiving full participation.

If an investor has chosen a thematic fund, they expect pure exposure to that theme. While the option exists, it should be used sparingly, only in extreme cases.

market would bounce back quickly. The last 18 months have shown investors that this is not how markets typically behave, and this is what a more normal market environment looks like.

If you look at the 30-year returns of the market, it is around 12 per cent CAGR. But if you look at five-year returns, people talk about 20-24 per cent. Those who entered post-Covid are used to those higher returns, and now 12 per cent feels like an underperformance relative to their expectations.

This is an important lesson that over the long term, markets tend to deliver returns broadly in line with nominal GDP growth and corporate earnings. They may overshoot for periods, but eventually, they normalise to earnings growth. So,

expectations also need to be aligned accordingly.

A low double-digit return is actually a very healthy outcome in equities over the long run. If you can double your money over four to five years, that is a strong result. Anything above that, one should be grateful.

The last 18 months have reinforced that markets are not meant for quick gains. They do not move in one direction at all times. Corrections of 10-30 per cent are very normal over longer periods, and this phase has been a healthy one.

So, the key is to stay invested and maintain faith in the Indian economy. Earnings growth will continue, and even if you enter at peak valuations, over a 5 to 10-year horizon, earnings growth should still deliver double-digit returns.

For the next 12-18 months, I recommend investors keep expectations moderate. A low double-digit return is a reasonable assumption. If things turn favourable, such as the resolution of geopolitical issues, lower oil prices, and a revival in private capex, there is a case for stronger growth. India can grow at 8 per cent plus, and corporate earnings could exceed 15 per cent.

In that scenario, foreign institutional flows will also return. My honest view is that there are very few markets globally offering this kind of growth. Despite recent outflows, domestic investors have provided strong support. The foundation is in place, so when conditions improve, flows will follow.

So rather than stepping back, this is a phase to stay invested. If anything, it is a matter of time before sentiment turns favourable again. ☑

[CATEGORY REVIEW]

Aggressive hybrid

A mutual fund category for investors who want the stock market's growth engine without fully surrendering to its volatility.

One fund. Two asset classes. One smart decision.

SEBI mandate: 65-80% equity, 25-30% debt instruments

2,87,854 Category AUM (₹ cr)	46 Total funds	73.9 Avg. equity allocation (%)	13.3 Median 3Y CAGR (%)
--	--------------------------	---	-----------------------------------

The return terrain

A horizon-by-horizon spectrum. While recent returns stretch wide, time narrows the odds.

Returns cluster in the mid-teens

Majority of three-year rolling returns lie between 8 and 16 per cent per annum

Based on three-year rolling returns from January 1, 2013 to April 2, 2026. Average fund in category considered.

Risk-return atlas

Aggressive hybrid occupies the optimal middle ground between risk and return

Returns and std. dev. are based on averages from Jan 2013 to Mar 2026. Bubbles are scaled as per the AUM of the category as of Feb 2026.

Portfolio DNA: Net equity tilt of 46 funds

Category's sector fingerprint vs Nifty 500

Value Research insight

Before you invest

Horizon: 5Y+

Minimum 5 years. Full market cycles need 7+ years to reward patience.

Risk: High

Moderately high to high. While debt cushions, deeper falls can still cause losses.

Taxation: EQ

Equity taxation. LTCG 12.5% (1Y+), STCG 20% (under 1Y).

Takeaway

Aggressive hybrid funds can suit first-time investors, offering equity-led growth with some debt cushioning during market downturns.

[CATEGORY REVIEW]

Our top picks

DSP Aggressive Hybrid ★★★

- Quality-focused equity paired with a deliberately conservative debt sleeve.
- Runs a more diversified market-cap mix than most peers, but has been steadily shifting from mid and

small caps to large caps over the past two years.

- While 2026 has been a difficult start, the fund has maintained top-half performance in the last three years.

Edelweiss Aggressive Hybrid ★★★★★

- Uses a factor-based framework that scores stocks on growth, quality, value and momentum before they enter the portfolio. Debt is actively managed within

a 1-5-year duration band.

- Consistent outperformer from 2021 through 2025, with 2026 continuing in that direction.

ICICI Prudential Equity & Debt ★★★★★

- Runs a large-cap heavy, value-oriented equity sleeve coupled with a tactically managed debt portfolio.
- Rock-steady outperformance across every

meaningful time period. That kind of breadth across different market regimes is genuinely rare.

Kotak Aggressive Hybrid ★★★★★

- Pushes hard on both levers, tactically investing in long-dated bonds while maintaining a steady mid-and small-cap equity bias (over 45 per cent of the equity allocation, as per February 2026 disclosures).

- This low-expense fund has stayed above average most of the time in any three-year period, delivering an average of 15 per cent per annum.

Mahindra Manulife Aggressive Hybrid ★★★★★

- Backs high-growth businesses and stays with them, with selective tactical moves around the core. Debt sleeve kept conservative.
- Outperformed the category every year since launch

in 2019, with 2023 being the closest exception at the second quartile.

- 2026 has started softly; it is the first real blip in an otherwise clean record.

Mirae Asset Aggressive Hybrid ★★★

- A steady, low-cost equity portfolio, anchored to large caps. It keeps the debt side safe with sovereign and AAA paper.

- After a rough 2024, it has come back sharply—top quartile in 2025 and so far until March 2026. The large-cap tilt proved its worth during the recent correction. ☒

Green under siege

War and volatility are now nibbling at multi-year gains

Data as of March 31, 2026 for BSE indices. Total Return Index (TRI) considered for all indices. Returns of over a year have been annualised.

Nifty MidSmallcap 400 50:50

We assess if an equal mid-small split merits your attention

Index snapshot

About the Index

Capped free-float index; the mid-cap segment represented by Nifty Midcap 150 stocks and the small-cap segment represented by Nifty Smallcap 250 stocks are equally weighted. Within each segment, stocks are weighted by free-float market capitalisation.

Launch date February 4, 2026	Base date April 1, 2005
Return since inception (% pa)* 16.4	Weight of top 10 constituents (%) 10.2

Top sectors by weight

Financial services (26.3%), Capital goods (13.1%), Healthcare (11.3%)

Source: NSE factsheet, dated Jan 31, 2026. *Total Return Index considered.

Diversified design but not more return

Beats the Nifty 500 frequently, but the 50:50 structure offers little edge over its non-strategic cousin

● Nifty 500 ● Nifty Mid Small 400 ● Nifty Mid Small 400 50:50

Five-year rolling return data for total return indices is considered.

The promise of balance, the reality of similarity

On drawdowns and recovery, the 50:50 mix offers little real advantage

Index	Avg. drawdown (%)	Avg. recovery time (years)	Standard deviation - 5Y (%)	Instances of negative return (% of time)		
				1 year	3 years	5 years
Nifty 500	27.7	1.2	16.0	19.3	5.9	0.9
Nifty Mid cap 150	33.0	1.1	17.6	23.4	9.5	0.8
Nifty Small cap 250	33.3	1.1	19.3	34.0	17.0	7.6
Nifty MidSmall cap 400	32.2	1.1	17.9	27.0	12.3	1.8
Nifty MidSmall cap 400 50:50	33.0	1.2	18.1	29.1	13.6	2.3

Based on total return index data from Apr 1, 2005, to Mar 31, 2026. Drawdowns of more than 15% are considered. Average recovery time excludes the recent drawdown for indices that had not recovered to their previous all-time high by Mar 31, 2026. Std. dev. is calculated for the 5Y period on a daily basis from Apr 1, 2021 to Mar 31, 2026.

Final verdict

Launched in February 2026, the Nifty MidSmallcap 400 50:50 gives small caps a larger role than they would have in a market-cap-weighted index. On back-tested history, it has outperformed the broader Nifty 500. But that edge disappears against the Nifty MidSmallcap 400, where outcomes are nearly identical.

It offers no meaningful risk advantage either. The index has struggled to consistently beat the Nifty Midcap 150, and its recovery profile shows the 50:50 structure has not made downturns easier to live through. In other words, the index may widen exposure within the mid- and small-cap space, but its case for differentiation or diversification still looks limited.

The passive hybrid test

This hybrid index has outdone even pure equity. What made it possible?

Hybrid funds have long been active managers' turf. That is now changing. India's first hybrid index fund was launched recently and more can follow soon. This first offering tracks the Nifty LargeMidcap250 plus 8-13 year G-Sec 70:30 index, which combines equity with long-term government bonds. Let us start with understanding how it is built and then examine its past performance.

- 70 per cent of the index sits in equity through the Nifty LargeMidcap 250, split equally between the Nifty 100 and the Nifty Midcap 150.

- 30 per cent sits in long-term government bonds via the Nifty 8-13 year G-Sec index that tracks the three most liquid sovereign bonds with maturity of eight to 13 years.

As a hybrid offering, the index pitches a simple promise: offer equity's growth with debt's stability. The recipe sounds sensible. But the proof is found in the pudding. So we put it to the test.

Performance that beats even pure equity

We put a simple question to 15 years of data: if you had invested in the hybrid index—or in the plain-equity Nifty 100—in any month since 2011 and held for five years, which would have given you better returns? In other words, we looked at every possible five-year holding period to test return consistency.

The hybrid index outperformed the Nifty 100 in over 90 per cent of all five-year windows, delivering an average annual return of 14.3 per cent versus 12.2 per cent for the large-cap benchmark. A hybrid index carrying sizable debt, beating a pure-equity index, can feel surprising at first, but the edge comes from the mid-cap exposure.

The hybrid index has a 35 per cent mid-cap allocation via the Nifty LargeMidcap 250, which has delivered average five-year rolling returns of 17.5 per cent over the last decade. Naturally, this pulls the overall return meaningfully higher.

Defying volatility and downturns

The volatility that comes as a result of mixing mid caps is blunted by the debt portion. The mid-cap index's average standard deviation (a measure of volatility) is a sharp 6.6 per cent against 3.9 per cent for the Nifty 100 over the tested five-year rolling periods. But it is only 1.1 per cent

Vinayak Pathak/AI-generated Image

for the long-duration G-Sec index. Its dampening effect, therefore, kept the hybrid index's overall volatility at 3.3 per cent, lower than the Nifty 100 but with better returns. The hybrid index has also fared better than the Nifty 100 during sharp market corrections, measured across episodes since 2011 when the large-cap index fell more than 15 per cent from its peak. The hybrid index

The case for mixing it up

The hybrid index beats pure large caps, mostly

25% pa ● Nifty 100 ● Nifty LargeMidcap 250 plus 8-13 yr G-Sec 70:30

Five-year rolling returns as of each month between Jan 2016 and Feb 2026.

A softer landing every time

The hybrid index held up better than the Nifty 100 across every major crash

Crashes considered since 2011, when the Nifty 100 total return index fell 15 per cent or more from its peak.

cushioned the fall better in all four market corrections. See graph 'A softer landing every time'.

In effect, the index has managed to exceed the Nifty 100 over the long term while softening the blows better during market falls.

The short-term caveat of the debt slice

Over long periods, the debt allocation has helped steady the index. But over shorter stretches, long-term bonds that make up the debt portion can themselves turn volatile. This is because longer-duration bonds are more sensitive to interest rate changes. When rates rise, long-term bond prices experience steeper declines while short-term bonds remain relatively insulated.

The graph 'Long bonds, short tempers' captures this well. It shows how the 8-13 year G-sec index's journey

Long bonds, short tempers

Long-duration returns are far more volatile

One-year rolling returns as of each month from January 2012 to March 2026.

Equal on return, unequal on risk

The long-duration index delivered similar average one-year returns but with higher volatility

Parameter	Nifty 8-13 yr G-Sec Index	Nifty Short Duration Index
Average 1-year return (%)	7.9	7.9
Worst 1-year return (%)	-2.4	2.7
Instances of negative returns (%)	10.0	0.0
Standard deviation (%)	5.2	2.1

Based on one-year rolling returns as of each month falling between January 2012 to March 2026.

has been much bumpier over the past 15 years. The Nifty Short Duration index, which tracks shorter maturity bonds of one to three years, was smoother in comparison. The volatility is starkly different, even when both have averaged nearly 8 per cent annual returns over this stretch.

The chances of losses are also comparatively high over short periods. The long-term index gave negative one-year returns nearly 10 per cent of the time, while the shorter counterpart never did. The worst return it gave over a single year was a negative 2 per cent, while the short-duration peer's worst was still a positive 2.7 per cent. See table 'Equal on return, unequal on risk'. What this tells you is that in a rising interest rate environment, the debt component may not protect the hybrid index as effectively as it does over a longer period.

Poor returns from the debt portion are possible over a year. At such times, the index's resilience can be tested, especially if the equity component is lagging too. But this should largely wrinkle out over a horizon of five years or more.

As the 15-year data earlier showed, the index in the long run still sees lower volatility thanks to the debt slice and higher returns due to the mid-cap exposure.

So, who is this index for?

Hybrid investing is for those who like balance. And this index delivers it. The mid-cap exposure lifts returns above what large caps alone would deliver and the government bond allocation blunts the volatility that mid caps introduce. The passive structure keeps costs low and removes the manager's risk of active hybrid funds. What has to be borne in mind is that over short horizons, long-duration bonds can add to volatility rather than contain it. Therefore, the index will suit those investors better who can stay the course for five years or more. ☒

Nippon India Nifty 50 Value 20 Index	

Data for direct plans as of March 31, 2026; portfolio data as of February 28, 2026. The scoreboard includes the top 150 equity index funds by AUM. Risk Grade measures a fund's downside volatility against a risk-free return. Based on underperformance, funds are rated: High (Top 10%), + Avg (Next 22.5%), Average (Middle 35%), -Avg (Next 22.5%), and Low (Bottom 10%). NR = Not rated.

Data as of March 31, 2026; portfolio-related data as of February 28, 2026. The scoreboard features the top 150 ETFs by AUM, excluding debt ETFs. Performance figures are based on market price, not NAV. Premium/ (discount) shows the average difference between the ETF's price and NAV over the past year. Tracking error reflects how closely the ETF has matched its benchmark returns. Liquidity is indicated by an icon next to AUM, based on average daily trading volume (ADTV): 🟢 High - above ₹1 crore | 🟡 Moderate - ₹10 lakh to ₹1 crore | 🟠 Low - below ₹10 lakh.

Compatibility beats popularity

Pick factor funds that match your profile, not the latest leaderboard

Most investors pick factor funds the way they pick stocks: by looking at what worked last year. This is a reliable method for buying yesterday's winner and inheriting tomorrow's disappointment.

Factor funds come in two broad forms. Passive smart-beta funds track factor-based indices like the Nifty 500 Momentum 50 index and have the potential to outperform traditional market-cap weighted benchmarks like the Nifty 500. Active smart-beta funds go further, aiming to outperform passive factor-based benchmarks by applying the same factors more dynamically. The mistake lies not in choosing between them, but in choosing based on recent performance rather than personal fit. Investors tend to make two

errors: chasing what just worked, and abandoning what has temporarily lagged. The antidote to both is self-awareness, not a sharper eye for recent performance.

Know your type before picking a factor

Not every investor is the same. Knowing your type is the first step to choosing the right factor.

The return-seeker - Momentum: Sid is aggressive, trend-following and wants to ride the market's current winners. Momentum backs stocks with strong recent price performance and rewards investors who accept that leadership rotates, sometimes sharply, leading to steep temporary drawdowns.

The patient contrarian - Value: Yuvraj is comfortable buying what the market has temporarily discarded, convinced that mispricing eventually corrects. Value demands most investors cannot supply on demand: the willingness to wait and to look wrong in the interim.

The resilience-focused - Quality: Shaurya prefers durable businesses over flashy narratives. Strong return on equity, stable earnings, low leverage, healthy cash flows. Such businesses tend to fall less and recover faster under stress. He accepts that in a momentum-driven bull run, Quality may sit out the party, a trade-off he considers reasonable.

The stability-seeker - Low Volatility: Nitin dislikes sharp drawdowns above all else. He is not chasing alpha. Low Volatility focuses on

Same factors, different times, very different pictures

Today's winner was once yesterday's laggard

Indices	5 yr point-to-point CAGR as on Mar 31, 2026	5 yr point-to-point CAGR as on Mar 31, 2020	5 yr median rolling returns as on Mar 31, 2026

stocks with smaller price swings, improves the investability of equity for cautious investors and accepts lower long-term returns relative to other factors in exchange for a smoother ride.

The cost of single-factor conviction

Every factor has rewarded investors over the long run. None has done so in a straight line.

For instance, as of March 2026, Value delivered a five-year CAGR of 28.5 per cent, the strongest in the table. Six years earlier, the same factor had produced the weakest -6.7 per cent per annum. The factor did not change. The time did. Hence, it is better to look at long-term rolling return than a single point-to-point return, and by that measure, every single factor and Multifactor strategy has outperformed Nifty 500 TRI.

The question every single-factor investor must honestly answer is whether they can endure stretches of underperformance, sometimes five years or more, without exiting. A poorly-timed exit does not just cost patience. It erases the very return they were waiting for. Kenneth French, Co-Creator of the Fama-French Factor Model said, "Given enough time, the factor premium is as close to a certainty as markets allow. The only way to lose it is to leave before it arrives."

This is where Multifactor earns its place. By blending all four factors, it softens the extremes of each. As seen in the table "Same factors, different times, very different pictures", Multifactor was not the highest; it never fell to the bottom either, hence delivering more

Every factor has rewarded investors over the long run. None has done so in a straight line.

consistent compounding and a smoother journey that most investors can actually stay in.

Choosing your factor in two steps

The selection process is straightforward. First, can you tolerate short- to medium-term underperformance, potentially for five years or more? If yes, proceed to step two. If not, Multifactor deserves serious consideration.

Step two asks what kind of investor you are. Aggressive and trend-following points to Momentum. Contrarian and patient points to Value. Resilience-focused and long-term points to Quality. Conservative and drawdown-averse points to Low Volatility.

Stay the course, or choose consistency

The real question in factor investing is not which factor will perform best. It is, which factor will you actually stay invested in when it inevitably underperforms temporarily? A well-matched factor and a committed investor are a compounding machine. A mismatched factor and an impatient investor is a cycle of buying high and exiting low.

For those who cannot commit with genuine conviction, Multifactor is the pragmatic answer: no factor-timing required, no single factor's bad patch to endure alone. In the end, the best factor for you is the one you will not abandon. ☒

SHYAMALI BASU

What investors are asking

How to handle your SIPs, cash and portfolio in uncertain markets

The market has gone through both a time correction and a price correction.

Narratives have shifted. But for many investors, portfolios haven't quite recovered.

Just as things were beginning to look a little better, geopolitical tensions in the Middle East erupted. Even traditional "safe havens" have come under question, whether it's cities, assets or metals.

For now, things feel uncertain. SIP flows remain steady, which is encouraging. However, my conversations with a few aggregators suggest something else is building, questions, hesitation and early signs of worry.

Here are some of the most common questions investors are asking right now, and how to think about them.

Should I continue my SIP?

Yes. You started your SIP with a long-term goal in mind. That hasn't changed.

For many investors, the post-Covid period meant investing through a rising market. The idea of "averaging" remained theoretical. This phase is different. It's the first real experience of a correction for many. That is exactly when SIPs matter most.

Stopping now would mean missing the very phase that improves long-term outcomes. Short-term events, even something as disruptive as geopolitics, should not derail a long-term plan.

Should I invest lumpsum after the correction?

This is a harder question, and an honest answer

What should you do?

depends on where you currently stand. Assuming all investments in equity are for the long term, here is how to think about it across three scenarios:

When will it end?

No one knows. That is the only truthful answer to the question.

For the conflict to de-escalate, several things would need to converge—a disruption severe enough in energy markets to force a rethink, mounting pressure from the international community, the human and infrastructural cost becoming too large to ignore, or simply one unknown factor that tips the balance. These are not variables any analyst or economist can model with confidence.

What we can control is our own

Don't measure the health of your financial life by the daily movement of your portfolio value

preparedness. Ensure you have enough liquidity to weather this period without being forced to sell. Try not to measure the health of your financial life by the daily movement of your portfolio value. Erosion of corpus during a crisis feels deeply unsettling, but it is not the same as permanent loss.

We have been here before. Every crisis, in the middle of it, feels like the worst one yet. And every time, markets have eventually found their footing. The old but reliable counsel applies here: never waste a crisis when it comes to investments. ☑

Safety has its own cost

Rajesh's portfolio is largely sound. A full exit from equity could undo that.

By Siddhant Madhav Joshi

Rajesh is 72. He has a ₹50 lakh portfolio. Seventy per cent of it is in safe instruments, ₹15 lakh each in SCSS (Senior Citizen Savings Scheme) and PMVVY (Pradhan Mantri Vaya Vandana Yojana, now closed to new subscribers) and the rest in fixed deposits. The remaining 30 per cent is a direct stock portfolio built after the Covid fall of 2020, which has since grown 2.5 times.

His monthly expenses are ₹45,000. His pension covers ₹25,000. SCSS and PMVVY cover the remaining ₹20,000.

Now, with markets looking uncertain, he wants to move everything to debt and asks how to do it with minimal tax. But tax is not the real issue. The real question is whether a full exit from equity is the right move at all.

Don't fix what isn't broken

Start with what is working. This is not an aggressive retirement setup. Income is largely taken care of. The pension covers more than half of the monthly expenses. The remaining gap is already being met through predictable income sources i.e. his investments in government schemes. The portfolio is tilted towards safety. Rajesh does not rely on equity for monthly income and is not forced to sell when markets fall. He already has the safety layer he needs. The risk now is not under-protection but under-performance.

At 72, Rajesh could live another 20 to 25 years. Over that time, inflation will erode purchasing power. Medical costs will rise. A portfolio that looks safe today can become insufficient a decade from

now. Equity is not in this portfolio to generate excitement. It is here to make sure the money lasts. Even a 20 to 30 per cent equity allocation meaningfully extends how long a portfolio can support fixed monthly withdrawals. The question is not whether equity should be zero, but how much equity is enough.

What actually needs fixing

The debt side of this portfolio is doing real work. SCSS and PMVVY are not just safe, they are funding the monthly shortfall. That makes them valuable. There is no need to disturb them. But not all debt instruments are equal.

Fixed deposits are safe and simple, but they are taxed every

Protected on all fronts, almost

Income secured, equity optional. Here is how Rajesh's money is split today.

Portfolio contributors	Invested amount (in ₹)	Monthly income contribution (in ₹)
 Senior Citizen Savings Scheme (SCSS)	15 lakh	10,250*
 Pradhan Mantri Vaya Vandana Yojana (PMVVY)	15 lakh	9,250
 Fixed deposits	5 lakh	Not being relied upon for regular income
 Equity (direct stocks)	15 lakh	Nil (not for income)
 Pension	—	25,000

*SCSS currently offers 8.2 per cent interest, paid quarterly. PMVVY is closed to fresh subscriptions. Existing investors continue to receive the previously assured 7.4 per cent return for the remaining tenure.

A little equity makes retirement money last longer

Even a small equity allocation helps portfolios last longer than all-debt ones

Assuming a 7 per cent annual return on debt and 12 per cent on equity. Annual expenses of ₹5.4 lakh and annual pension income of ₹3 lakh are both assumed to rise by 6 per cent every year. The 70:30 debt-equity portfolio assumes yearly rebalancing.

year. That annual tax reduces effective returns. Over time, this drag becomes meaningful, especially for someone thinking about tax efficiency.

This is where the portfolio can improve, not by replacing everything, but by refining it. The FD portion can be gradually reduced and parked in high-quality short-duration debt funds, mutual funds that invest in bonds and other debt instruments having a duration of one to three years. They defer tax until redemption, improving after-tax returns without adding meaningful risk.

On the equity side, the issue is not the allocation. It is the form. A direct stock portfolio demands active attention: tracking businesses, reading results, making sell decisions. In retirement, that becomes a burden. The better move is to simplify, not exit.

Over the next two to three years, shifting from direct stocks into two or three flexi-cap funds—diversified funds managed by a professional fund manager, investing across company sizes—preserves the equity exposure

while removing the effort of managing it ourselves.

If you still want to reduce equity

If Rajesh wants to bring equity down further, one thing matters first. The only sound reason to hold an individual stock is conviction. If he no longer follows these businesses closely, or no longer believes in them the way he did in 2020, that alone is reason enough to exit regardless of markets or tax.

If conviction holds, a staggered exit makes the most tax sense. Long-term capital gains on listed equity and equity mutual funds are tax-free up to ₹1.25 lakh per year. Beyond that, they are subject to a 12.5 per cent tax. In Rajesh's case, his ₹15 lakh equity holding has grown from ₹6 lakh, reflecting a 2.5x increase in his investments. The approximate gain is ₹9 lakh. A single-year exit means a tax bill of approximately ₹96,875. Spread over four years, the total tax falls sharply, a saving of roughly ₹46,000.

Our take

This portfolio does not need a

Exit in parts, keep more of your money

Spreading redemptions over four years cuts the tax bill nearly in half

Assuming equal redemption in four years and zero return in equities during this tenure.

dramatic overhaul. The priority is to act on what can be improved without dismantling what is already working.

A full move to debt might feel like the safe choice. It is not. It trades short-term comfort for a long-term reduction in the portfolio's staying power. Rajesh's setup is largely sound. The goal is not to rebuild, but refine it.

What to do next

- ▶ Leave SCSS and PMVVY untouched. They are funding monthly cash flow reliably.
- ▶ Shift the FD portion gradually into short-duration debt funds for better tax efficiency.
- ▶ Move the direct stock portfolio into two or three flexi-cap funds over two to three years, booking gains within the annual exemption limit each time. ☒

Set-off rule explained

Can short-term capital loss from equity be adjusted with long-term capital gains from gold?

- Anonymous

Yes, a short-term capital loss (STCL) from equity can be set off against long-term capital gains (LTCG) from gold. STCL is flexible and can be adjusted against both short- and long-term gains across asset classes.

Typically, you first offset it against short-term gains, and any remaining loss can reduce long-term gains. If losses still remain, they can be carried forward for up to eight years. While this is a useful tax rule, it is not a strategy. Don't take positions just to harvest losses. Your investment decisions should be driven by asset allocation and long-term goals, not tax adjustments.

A geopolitical event may feel large today, but for long-term investing, it is often just a temporary phase

Invest now or wait?

Is it better to enter the mutual fund market now or wait for the outcome of the Iran war before investing?

- Saravanan Rangamannar

Don't try to time events like a war. By the time you react, markets would have already priced in the news. Waiting for "clarity" usually means buying after the recovery.

If you're running SIPs (systematic investment plans), continue them; this is when rupee cost averaging works best. If you have a lumpsum, stagger it through an STP (systematic transfer plan) over 6-12 months instead of investing all at once.

More importantly, focus on your goals and asset allocation, not headlines. A geopolitical event may feel large today, but for long-term investing, it is often just a temporary phase. The bigger risk is reacting emotionally and breaking your plan.

An emergency fund is not the place to optimise for tax. Its job is to be available when you need it most.

You don't need small caps

Can I have a meaningfully diversified equity portfolio without a small-cap fund?

I have an investment horizon of over 10 years in SIP mode.

- Rupam Sarma

Yes, you can build a meaningfully diversified, high-growth portfolio without a dedicated small-cap fund. A flexi-cap and a multi-cap fund already invests across large, mid and small companies, giving you exposure to small caps when opportunities are attractive, without the extreme volatility of pure small-cap funds.

For a over 10-year SIP, a simple flexi-cap fund or a multi-cap fund can cover most of the market. This approach improves consistency and makes it easier to stay invested during downturns.

Small-cap funds can add returns, but their sharp swings often test discipline. If you can't hold through those phases, they may do more harm than good.

The real purpose of emergency fund

For emergency funds, is it better to allocate 50-60 per cent to liquid and arbitrage funds and the rest to equity savings funds, rather than to fixed deposits (FDs) due to taxation?

- Dharmesh

An emergency fund is not the place to optimise for tax. Its job is simple: be available, stable and predictable when you need it most.

Savings accounts and liquid funds fit this role well, with easy access and near-zero chances of short-term losses. You can add a small portion to short-duration funds for money you won't need immediately.

But equity savings funds don't belong here. They can deliver negative returns even over short periods, exactly when emergencies strike.

Think in layers: keep some cash in your bank, the core in liquid funds and a small outer layer in slightly higher-yield debt options. When it comes to an emergency fund, safety comes first, not returns.

SEBI's push for clarity

What has SEBI's latest reform really changed for investors?

At its core, the intent is simple. SEBI is trying to declutter the mutual fund space, simplify categories and bring clarity to how funds are structured and presented.

The first big shift is around so-called 'retirement' and 'children's' funds. The idea is straightforward; there is no one-size-fits-all solution. Someone 30 years away from retirement needs a very different asset mix compared to someone just 10 years away. Similarly, investing for a newborn is very different from investing for a 10-year-old.

Earlier, these funds followed a standard hybrid allocation, ignoring such differences. Now, instead of pushing fixed labels, SEBI is nudging fund houses towards more flexible structures. In effect, any fund can serve a retirement or children's goal; what matters is how you use it, not what it is called.

The second change tackles the rise of thematic and sector funds. Over time, many such funds were launched around compelling narratives, often more story than substance. Investors tend to get drawn to these stories. SEBI is tightening the rules here. Any new thematic or sector fund must clearly demonstrate how it is meaningfully different from what already exists. If it cannot, it will not be approved.

The third change focuses on style purity, what you can call "true-to-label"

SEBI is trying to declutter the mutual fund space, simplify categories and bring clarity

Watch video

Gold is best viewed as insurance, not a return-generating investment. A 5-10 per cent allocation is reasonable.

Watch video

investing. Funds must clearly state what they are and stick to it. If a fund is flexi-cap or multi-cap, it should be labelled as such. No vague or creative naming that could mislead or create false expectations.

Put together, this reform is not about adding complexity. It is about removing it. Fewer labels, fewer overlapping products and clearer categories. In short, what you see is what you get.

Gold's role in your portfolio

Gold is at an all-time high. Does that mean it's time to load up?

Not quite. Gold is best viewed as insurance, not a return-generating investment. From that lens, a 5-10 per cent allocation in your portfolio is reasonable.

But insurance works only when bought before the accident, not after. When gold is already at elevated levels, the risk is that you are reacting to price, not preparing for uncertainty.

What makes the current phase more telling is investor behaviour. Gold inflows have overtaken equity fund inflows (in January 2026), and quite sharply. Such shifts are rarely driven by planning. They are usually reactions to recent performance.

When investors rush into an asset after it has already done well, it often reflects poor timing rather than thoughtful allocation.

The takeaway is simple. Gold has a role, but a limited one. It belongs in a disciplined portfolio, not as a response to recent price moves.

[SCOREBOARD] Guide

Optimise your investments with clear and comprehensive mutual fund data

► Serial Number

A serial number is generated for every fund and is the first column on the Scoreboard. To locate a specific fund, look for this number in the Index against the name of the fund.

► Portfolio Composition

For equity funds, it shows the portfolio's allocation in large-, mid-, small-cap stocks and cash/others. **Value Research** follows its own market-cap classification to arrive at this. The top listed companies that constitute 70 per cent of the market cap are classified as 'large caps'. The ones that fall between 70-90 per cent of the total market cap are classified as 'mid caps'. The smallest listed companies that comprise the remaining 10 per cent of the market cap are called 'small caps'.

In the case of hybrid funds, the minimum and maximum allocations to equity and debt over the past 12 months are displayed. For funds launched within the last year, the available historical range is provided. The equity exposure is shown net of derivatives (unhedged portion).

Portfolio Composition (%)			
Equity		Debt	
Min	Max	Min	Max

► Alpha

Indicates value added (or subtracted) by the fund vis-a-vis the benchmark, for the risk taken. A positive alpha indicates that the fund has performed better than expected, while a negative alpha indicates the fund has underperformed based on the risk taken by the fund manager. It is calculated using calendar month returns for the last three years.

S.No.	Fund Name	Performance								Portfolio Composition (%)										
		Returns (%)				Rank				Large Cap	Mid Cap	Small Cap	Cash & Others	Alpha	Info. Ratio	Risk Grade	Expense Ratio (%)	Assets (₹ cr)	Fund Rating	Average Rating
		1Y	3Y	5Y	10Y	1Y	3Y	5Y	10Y											

Portfolio Composition			
Credit Quality (%)		Avg. Maturity (years)	
High	Medium	Low	

► Credit Quality

Debt fund's portfolio exposure across three levels:

- **High**
Includes exposure to government securities and corporate bonds with the highest grade ratings such as AAA, AAA+, AAA-, A1, A1+, P1+, AA+ and cash.
- **Medium**
Includes exposure to bonds with medium grade ratings such as AA, AA-, A2+ and A2.
- **Low**
Includes portfolio exposure to bonds with lowest grade ratings such as A+, A, A-, A3, BBB+, BBB, BBB-, BB+ and below.

► Average Maturity

Weighted average maturity of all debt securities held by the fund.

► Information ratio

Indicates excess returns generated by a fund relative to the category benchmark and the consistency of that out-performance. A higher information ratio compared to other schemes with the same benchmark reflects better risk-adjusted performance. It is calculated using calendar month returns for the past three years.

► Risk Grade

Value Research Fund Risk Grade measures a fund's risk of loss, focusing only on downside volatility, unlike standard deviation and beta. It accounts for absolute losses and periods of underperformance compared to a risk-free investment. This reflects the risk of earning less than a guaranteed return, such as from a term deposit. Fund risk is calculated by comparing monthly/weekly returns to the risk-free return (State Bank's 45-180 days Term Deposit Rate) and measuring underperformance. Average underperformance is used to derive a risk score, which is rated against the category average. The risk score of a fund is then rated according to the following distribution:

High : Top 10%
Above Avg (+Avg) : Next 22.5%
Average : Middle 35%
Below Avg (-Avg) : Next 22.5%
Low : Bottom 10%

► Fund Rating

The **Value Research Fund Rating** is a convenient composite measure of returns and risk, based on a quantitative system without any subjective components. It provides a quick summary of a fund's historical performance relative to its peers, adjusted for risk. For equity and hybrid funds, the system combines three- and five-year performance periods, while debt funds' ratings are based on 18 months and 36 months of weekly risk-adjusted performance. Only equity funds with a minimum three-year performance history are rated, and for debt funds, the minimum is 18 months. A category must have at least 10 funds with an average AUM of at least ₹5 crore over the past six months to be rated. The rating distribution is as follows:

★★★★★ : Top 10% funds
 ★★★★ : Next 22.5%
 ★★★ : Middle 35%
 ★★ : Next 22.5%
 ★ : Bottom 10%
 NR : Not Rated

► Average Rating

The average of the monthly fund ratings over the past three years. For newer funds, the available rating history is used.

Nippon India Mutual Fund

Wealth sets you free

Rooted in strength, Shaping tomorrow!

Strength of **Large-cap** meets
the growth potential of **Mid-Caps**

Presenting

Nippon India Vision Large & Mid Cap Fund

Nippon India Vision Large & Mid Cap Fund uses a dual strategy, combining the strength of large-cap stocks with the growth potential of mid-caps. Large caps endeavor to provide relative stability & liquidity and mid caps can potentially generate relatively better return.

What the fund offers:

Dual Strategy:
Strength of **Large caps**,
growth potential of
mid-caps

Strategic Blend:
Industry leaders meet
emerging leaders.

Long-Term Vision:
Optimal mix of market
leaders.
