A. Joseph Dorairaj

Behind every successful individual is a mentor. Homer's *Odyssey* refers to Odysseus' close friend Mentor, who guided the former's son during his father's long absence. Socrates mentored Plato, who tutored Aristotle. In the Indian tradition, Ramakrishna Paramahansa mentored Swami Vivekananda and Chanakya was Chandragupta Maurya's mentor. In modern times, Maya Angelou mentored Oprah Winfrey, and Vikram Sarabhai, Satish

Dhawan and Brahm Prakash mentored A.P.J. Abdul Kalam. All human beings need mentors. We look for someone who will show us the way forward, listen to our success stories, worries and anxieties with empathy and be a moral compass in our lives. While higher educational institutions in India mandate that faculty should counsel students and help them navigate their academic and non-academic lives, unfortunately, mentoring has become a ritual where the faculty meet their wards only for the sake of records for accrediting agencies.

Skills for a mentor What skills should a mentor possess? First is empathy. A mentor should be try to see the world from the student's perspective. Another aspect is the ability to assess the student, especially in terms of aptitude and talent, so that they can be helped to make informed decisions for their future. A commitment of time and energy to help the student develop and mature is essential. Next comes the ability to counsel young adults and help them come to terms with themselves and face the world confidently. This may also involve dealing

with mental health issues and the mentor should, if needed, refer the students to professional counsellors. Mentoring does not end when the student leaves the institution. It involves establishing long-lasting ties. Finally, establishing clear professional and personal boundaries is crucial to ensure that there is no misunderstanding. **Problem areas** But there are some challenges to be addressed. In Indian higher education, most teachers have domain-specific knowledge and competence but not the training to be a success-

ful mentor. Professional help will enable the faculty to deal competently with serious issues, especially psycho-social ones. Since it may not be possible to train all the teachers, HELs can identify specific people in each department to undergo training and they can then pass on their knowledge to their colleagues. Another issue is that mentoring in many colleges and universities is confined to academic guidance. There are two major reasons for this: the teacher is not a trained counsellor and may not have the time and competence to go beyond academics, as they are dealing with an already crammed schedule. Given the large size of the classes, it may not be possible for teachers to schedule regular and formal sessions with their students. But the faculty should walk the extra mile to help those who need their guidance. Mentoring should not be reduced to a mere ritual or cerebral exercise. A mentor continually monitors and handholds the students and helps them blossom into happy and responsible adults who will strive to establish a just world. Colleges and universities desperately need qualified and competent mentors who will assist students.

The writer is Emeritus Professor, School of English and Foreign Languages, Gandhigram Rural Institute Deemed-to-be University.

SCHOLARSHIPS

Mohan T. Advani Centennial Scholarship Offered by the Blue Star Foundation. **Eligibility:** First- and second-year students in degree or diploma programmes in Architecture and Engineering, such as Mechanical, Electrical, Electronics, and Production Engineering (Civil Engineering excluded), at selected partner colleges across India. First-year applicants must have minimum 80% in Class 10 and Class 12; second-year applicants must have 80% in Class 12 and 75% in the first year. Annual family income must not exceed

₹600,000. **Rewards:** ₹100,000 or 75% of academic fee, whichever is lower for UG students; ₹40,000 or 75% of academic fee, whichever is lower for Diploma students. **Application:** Online **Deadline:** July 31 www.b4s.in/edge/BSFS6 **MPOWER Women in STEM Scholarship** Offered by MPOWER Financing. **Eligibility:** Girls who are enrolled as full-time students in a STEM degree programme at one of the MPOWER's partner universities and are international students legally permitted to pursue studies in the U.S. or Canada, holding a valid US

study visa (or DACA status) or a Canadian study permit, as applicable. **Rewards:** Up to \$5,000. **Application:** Online **Deadline:** December 31 www.b4s.in/edge/MPWO1 **National Renewable Energy Internship** Offered by the Ministry of New and Renewable Energy, Government of India. **Eligibility:** Open to UR, PG, and doctoral students, as well as research scholars enrolled in recognised institutes or universities in India or abroad. **Rewards:** ₹15,000 a month **Application:** Online **Deadline:** Round the year www.b4s.in/edge/NREI1

SAVE THE DATE

Admissions **ITM Skills University** has launched its Master of Computer Applications programme with specialisations in GenAI, Data Science, and Cybersecurity. **Eligibility:** BCA, B.Sc Computer Science/IT, B.Tech/ B.E, or an equivalent technical UG degree <https://isu.ac.in/mca/>

CBS International Business School and YES Germany have launched the Prep4University programme in India. Students can complete their academic foundation and specialised German

language training in Delhi to prepare for the qualifying Feststellungsprüfung (FSP) exam at CBS Köln. **Eligibility:** More than 70% in class 12 exams and an IELTS score of 7. <https://tinyurl.com/374vmr3u>

The University of Western Australia has opened applications for UG and PG courses in Business, Computer Science, AI, Data Science, Cyber Security, Economics, Enterprise and Innovation, MBA and Information Technology at its Mumbai and Chennai campuses. Scholarships are available. More details at india.uwa.edu.au **Illinois Institute of Technology (Illinois Tech),**

the U.S., Mumbai campus, opens applications for the inaugural Fall 2026 intake across various UG programmes, commencing this September. For details on courses, eligibility, scholarships, and more, visit <https://www.iit.edu/mumbai>

The Faculty of Science at **the University of Strathclyde, Glasgow,** is offering the International Excellence Award for M.Sc. programmes. **Eligibility:** International (non-EU) self-funded fee-paying students holding an offer for a full-time Taught Master's degree for January 2027 entry. **Deadline:** November 30 <https://tinyurl.com/3mruhrat>

OFF THE EDGE
Nandini Raman

I finished B.Sc. Agriculture in 2023 and am working in ICAR on contract. I don't want to continue here. I prepared for the state PSC exams but could not make it. What else can I do? Pravalika

Dear Pravalika, Why do you want to give up this job: is it administrative, repetitive, offers limited growth, or are you feeling burnt out? Moving on from a job that drains you is a healthy decision but weigh the pros and cons, given the current job market. With regard to the State PSC exams, failure is not a reflection of your competence since the exams have few seats and are highly competitive. You have a highly specialised degree that is in demand outside conventional research labs. You can explore stable government careers such as IBPS Agriculture Field Officer (AFO), NABARD Grade A Officer, or technical and management roles in FCI and FSSAI, which offer transparent and faster recruitment. In the private sector, FMCG companies, agrochemical and seed MNCs recruit agriculture graduates for procurement, product development, technical support and field management. Agri-tech startups also value graduates who can bridge technology and farmers. If you want to move into corporate leadership, an MBA in Agribusiness Management from institutes IIM-Ahmedabad (FABM), IIM Lucknow (ABM), IRMA, or MANAGE is an excellent option.

I am in the first year of an

Be realistic
Uncertain about your career options? Low on self-confidence? This column may help

Integrated M. Tech in Software Engineering. I have good coding skills and enjoy it, but am not good in academics. What should I do to future-proof my career? Dheshie

Dear Dheshie, While the tech industry is shedding the weight of low-skilled, rote-learning coders, individuals who genuinely love building things, solving puzzles, and learning continuously will see an incredibly rewarding time. Your coding skills will put you ahead of a vast majority of students who chose this field just for the pay cheque. Tech companies care more about what you can build than your ability to memorise a textbook. Shift from a Coder to a Problem Solver. Focus on System Design and Architecture, and pay attention to Data Structures and Algorithms (DSA), Operating Systems and Database Management Systems (DBMS). Learn how to connect applications to databases, secure them, deploy them on cloud infrastructure like AWS or Azure, and monitor performance. Maintain an active GitHub profile and showcase projects that solve real problems. Build AI-augmented projects; don't fight AI, leverage it. Start solving problems on LeetCode or HackerRank. Focus on internships and projects with corporate research labs, tech firms and deep-tech startups. Finally, strengthen your technical communication, presentation and project documentation skills.

I am in Class 12 and want a career in aviation. Which is better: cadet pilot

programmes or the CPL route? Name withheld

The Cadet Pilot Programme is a structured route offered by major airlines in partnership with international flight schools. Selection is highly competitive and includes written tests (Maths, Physics, English and aptitude), psychometric assessments, the Compass/Symbiotics test, and a final interview. It typically costs ₹85 lakh-₹1.1 crores. However, a job is guaranteed only if you complete every stage of training. Failing repeatedly can mean leaving the programme with significant debt and no job. The CPL Route offers greater flexibility. You choose a DGCA-approved flying school, clear five DGCA ground exams, and complete 200 flying hours. This costs around ₹65-75 lakhs. While earning the licence is achievable, securing an airline job is the bigger challenge. Graduates compete with thousands of other CPL holders, and hiring depends on industry demand. For now, focus on Physics, Maths, and English, as these are essential for the DGCA computer number. Before investing in coaching or flight training, undergo a DGCA-authorised medical examination to ensure you meet the strict medical standards. I am 25 and have a B.Tech Civil Engineering and a diploma. I am working in a government job but the role involves coping with political pressure. There is no work-life balance or respect for the individual. I want to move into Mechanics especially

Automotive. But my core is civil. I don't want to leave this job without another in hand. What can I do? Chandrahas

Dear Chandrahas, It takes immense courage to acknowledge that a stable government job is draining your mental health, self-respect and personal life. Pivoting from Civil Engineering to Automotive/Mechanical Engineering is possible but, because the foundational principles differ, you need a targeted strategy to bridge the gap. The fastest and most realistic route is through Computer-Aided Engineering (CAE) and Simulation. Learn through online courses or weekend certification programmes and complete CAD software courses. Master CATIA or SolidWorks, followed by Ansys or HyperMesh. Look for reputable weekend or evening PG diplomas in Automotive Engineering, EV Technology or Tool Design that accept B.Tech graduates. Take advantage of the Electric Vehicle boom by gaining a certification in EV Powertrain or Battery Design. You could also explore heavy machinery and infrastructure equipment or pre-engineered buildings and industrial steel structures. Build a digital portfolio showcasing your CAD models and simulations. Optimise your LinkedIn profile and highlight your analytical skills. Finally, apply to engineering service providers such as Tata Technologies, KPIT, Altran and Infosys Engineering. **Disclaimer: This column is merely a guiding voice and provides advice and suggestions on education and careers.**

The screen test

Do college entrance exams test knowledge or computer skills?

Devendra Kumar

The ongoing shift towards computer-based entrance examinations in India was meant to solve real problems. It promised faster evaluation, smoother logistics, standardised testing conditions and, above all, a more modern assessment system. In principle, these are worthwhile goals. Yet, an uncomfortable question now confronts us. When an examination is conducted only on a computer, is it testing subject knowledge alone or also a student's familiarity with the machine? This is not an argument against digital examinations. India cannot, and should not, retreat from technological progress. But advances in education must be judged not merely by administrative convenience but by whether it enlarges fairness. An entrance test is supposed to measure preparation in the subject and not inadvertently reward those who are more comfortable navigating screens, scrolling passages, switching between tabs, or managing a

mouse under pressure. This concern is especially relevant in the context of the Common University Entrance Test (CUET), which was introduced to create a common platform and reduce inequities produced by differing school boards and admission processes. But a common test can become an unequal test if the conditions needed to take it are themselves unequally distributed.

Wide gap The digital divide in India is no longer about internet access alone. It is also about the quality of access. For many urban students, computers, online mock tests and digital interfaces are part of everyday academic life. However, for others, access is irregular, shared, paid for by the hour at a cyber café, or absent altogether. Even among students who are intelligent and hardworking, comfort with a screen cannot be assumed. Research has long shown that exam mode is not neutral. Students unfamiliar with digital interfac-

es often face an additional cognitive burden. They are not just solving questions, but also managing an unfamiliar testing environment. In a high-stakes exam, even small hesitations can matter. Time lost in navigation, anxiety about clicking the wrong option, or discomfort with reading long passages on screen may cumulatively affect performance. In such cases, the examination risks measuring technical ease as much as academic merit. There is also a psychological dimension. All entrance examinations generate stress. But technology-mediated exams can introduce a different kind of anxiety: not be about the syllabus but about the system itself. Students with limited exposure to computers may carry this additional stress into the exam hall before a single question is attempted. Still, it would be unfair to suggest that paper-based exams are automatically superior. Computer-based testing offers clear advantages. It can reduce manual errors, speed up pro-

cessing, standardise the presentation of questions, and, if designed well, improve transparency. Nor is pen-and-paper immune from malpractice or logistical breakdowns. The real issue, then, is not digital versus non-digital. It is whether one format should be imposed uniformly in a deeply unequal educational landscape. **Road ahead** A balanced way forward lies in reducing the bias towards technical proficiency without discarding the gains of digitisation. First, major entrance examinations should consider a hybrid option for a transitional period, allowing students to choose between computer-based and OMR-based formats. This will separate knowledge assessment from medium familiarity. Second, if computer-based testing is to remain the base, government schools should provide free mock tests, mandatory interface orientation, and hands-on digital practice well before the examination season. Third, exam design requires simpler interfaces, more intuitive navigation, and clearly structured screens to reduce anxiety. Good assessment design should minimise the role of interface skill in determining outcomes. Finally, access must be treated as part of fairness. If the system expects every student to take a digital exam, then reliable digital preparation should become a public guarantee, not a private advantage. The question is not whether India should modernise its examinations but whether modernisation will remain inclusive. A just examination system should test what a student has learned, not how effortlessly the student can handle a device. The writer is Founder, Ladli Foundation.

CAREER CUES
Richa Dwivedi Saklani

A bright, hardworking child genuinely good at academics and with a stellar profile is stumped when asked: “What are you curious about? What do you find yourself thinking about when nobody’s asking you to think about anything?” They’re not sure and have no answer; surprisingly, they’ve never really thought about this before. But when researching what the Ivy League and top universities look for these days, they will all say, “intellectual curiosity...”

Third pillar
So, what is “intellectual curiosity?” In 2011, a team of psychologists at the University of Edinburgh, the U.K., studied data from around 200 studies involving 50,000 students and asked: what actually predicts how

well a student does academically? The predictable answers were intelligence, conscientiousness, working hard, showing up, and being disciplined. Then came the finding that should have changed how we think about education: Intellectual curiosity, the hunger to explore, to understand, to keep asking why ... This impacts academic performance almost as much as intelligence itself. The researchers called it “the third pillar”. Intelligence, effort, curiosity. All three matter. Yet our education system and society spend almost all of their energy on the first two and almost none on the third.

In 2022, PISA, the international assessment that tests 15 year olds across 81 countries, found that curiosity had the greatest relationship with performance in Maths compared to any other factor measured. Eighty-one points separated students with high curiosity from students with low curiosity. That is not a small gap. The same research also consistently finds that cu-

GETTY IMAGES/ISTOCKPHOTO

riosity declines as children get older, not because they become less curious but because systems around them teach them that curiosity is not being rewarded.

Why does this matter now? Think about what a typical high-achieving Indian classroom actually rewards: recall, speed, accuracy on a defined set of problems covering the chapter, answering in the exact words used in the textbook, and finishing the paper on time. Now think about what curiosity requires. Time to wander. Permission to ask a question with no guaranteed answer. The safety of not knowing something yet and finding that interesting rather than threatening.

Research has found that when children enter school, the number of questions they ask per hour actually declines and stays down throughout primary school. Not because they have fewer questions. But because they learn quickly that asking questions is not what school is for. When feedback is about rankings and

scores, curiosity goes down. When feedback is about whether you understood something correctly, curiosity goes up.

Crucial skills
The World Economic Forum surveys over 1,000 of the world’s largest employers every year and asks them what skills they need most. In the 2025 report covering 14 million workers across 55 countries, curiosity and lifelong learning appeared in the top 10 core skills. Analytical thinking was number one. Creative thinking was number four. All three require the same underlying disposition: a person who finds problems interesting, not threatening; someone who can sit with uncertainty and not get overwhelmed; someone who actually wants to understand rather than produce the right output.

Intellectual curiosity is not a technical skill. You cannot teach it with a coding bootcamp. It is built or destroyed over years of schooling, by the questions a teacher encourages or dis-

courages, by whether a child feels safe not knowing yet, by what gets celebrated in a classroom or, for that matter, even at home.

The NEP 2020 encourages inquiry-based, competency-led education and calls for a massive shift away from rote learning. But policy and practical implementation are completely different things. The CBSE allows any combination of subjects but schools face constraints: curricular challenges, board exams and parents who want marks.

But curiosity doesn’t require a curriculum overhaul. It requires small, deliberate choices. It’s noticing which students are quietly curious in ways that don’t show up in marks and finding a way to feed that, rather than smooth it over. Today, machines are getting better every year. But what we’re not encouraging is what these machines actually need: asking better questions to get better answers!

The inner network

Do you acknowledge the people who actually notice you, laud your efforts, and lend an ear every time you express yourself?

YOUR OWN GPS
Nivedita Das Narayan

In summer, a dip in municipal supply compounded by a water tanker strike meant daily rationing: taps switched off from 11.00 am to 5.00 pm. We’ve quietly adjusted. One day, having forgotten the approaching deadline, I rushed to the shower with barely three minutes to spare. The water didn’t stop. My watch read past 11.00. The feeling was quietly celebratory, even evoked an urge to share, but whom to tell? There is, of course, our society WhatsApp group, where daily grievances of early cutoffs are routine. Sharing the good news risked an undesirable outcome; reminding someone to fix the oversight meant losing the bonus supply. No one said anything that day! Silent relief and the sound of running water; no hurrahs, no congratulatory words for the water-management committee either.

Compliment vs. complaints
This brings me to reflect on how often we escalate a bad experience versus complimenting a good one. How often do we notice and acknowledge a person who serves us and contributes to our functioning lives? The quick commerce apps we routinely use are a good representation of the answer; an entire drop-down gallery of grievances and call-ins for a botched delivery versus

an optional click, 1 out of 4 options, for degrees of customer satisfaction. We escalate complaints effortlessly while compliments stagger, even require a decision. Quick commerce, housing societies, workplaces, relationships ... the feedback loop of modern life is built for grievance. Nobody built a button for ‘this was excellent’ or ‘I value you’.

This asymmetry between complaints and compliments, not just as a social habit, but as a way of moving through life, is troubling. The effort of people who are the constant in our lives gets noticed mostly in their absence. We may not be indifferent, but our inattention and self-absorption make us forgetful of expressing gratitude. There’s also a pattern in assuming that silent approval is enough. Hence the asymmetry compounds and no one benefits. The act of expressing a Thank You is itself the exchange; without it, the loop never closes. The giver never knows their effort landed and the receiver never feels the warmth of giving.

Cycle of unfulfillment
There’s a self-defeating pattern even beyond this. In our life situations, we pour a disproportionate amount of energy into relationships that are non-reciprocal and non-committal: as a student, employee, friend, or family member, toward teachers who don’t fully understand our potential, friendships where we are never sure of our standing. Ironically, this uncertainty itself keeps us eager to please, perform, and remain anxious.

Meanwhile, the friend who has shown up without being asked, the parent who has tracked every small win and need of yours, the mentor who remembers what your ambition is, the relationships that ask nothing of you performatively only get your leftover energy. We reserve our best for rooms that haven’t accepted us fully and the extra effort becomes so tied to our identity that angst and heartbreak are common.

How can we break this cycle of unfulfillment? When you have time, examine these imbalances in your own life. The unreciprocated relationship, the times when you forget to express gratitude and, finally, the small circle that actually notices you, lauds your efforts, and lends an ear every time you express yourself. Learning to pay attention to them, pausing to let their recognition land, to stop discounting their attention as ordinary, are some of the more underrated recalibrations you need to make in early adulthood. Count those people in your life. This is your real network. Not your followers, nor those you follow. Connect back with their energy every time you feel empty or spent. Express your genuine regard for their attention and availability, as you build your life.

The people who follow your progress, your incremental efforts with interest and pride, are few enough to count. My question to you ‘are you counting them as yours’?

Ajith Mohan

Among the most common decisions facing Engineering postgraduates today is one that looks deceptively simple: Electronics Engineering or Embedded Systems? Both are in demand and many universities offer them within the same department. On paper, it is a matter of preference. In practice, the two disciplines diverge in ways that will define very different career trajectories over the next decade.

Electronics Engineering is the foundational discipline of modern hardware – semiconductor physics, circuit design, power electronics, and telecommunications. It is the right path for those drawn to the physical layer of technology, designing the components from which everything else is built. Graduates typically enter semiconductor firms, power utilities, and telecommunications companies, working at the component level where the physical laws of electricity are the primary

Choose your circuit

Which course is more future-ready: Master’s in Electronics Engineering or Embedded Systems?

GETTY IMAGES/ISTOCKPHOTO

constraint.

Embedded Systems sits at the intersection of Electrical Engineering and Computer Science, building dedicated computing systems within larger mechanical or electronic frameworks. The control unit managing an EV battery, firmware inside a medical device, edge processing logic in an industrial robot

– these are all embedded systems problems. The engineer must hold hardware constraints and software architecture in mind simultaneously.

The practical difference is that electronics engineers build the house, while embedded engineers make it smart. The driver is edge computing and AI. Embedded AI – running

GETTY IMAGES/ISTOCKPHOTO

The right choice?

Five questions students must ask before choosing Electronics and Communication Engineering

Devika Kataria

In India, the Ministry of Electronics and Information Technology has approved over \$750 million worth of projects for electronic components manufacturing. The country is witnessing rapid growth in the production of integrated circuits (semiconductor chips), LCDs, smartphones, GPS systems, automobile sensors, medical equipment, household appliances, automobile electronic control systems, and wearable devices. Given this expanding ecosystem, students considering Electronics and Communication Engineering (ECE) must ask the right questions before making their choice.

Will investments by MNCs and the government translate into sufficient job

opportunities for fresh graduates?

While government initiatives and industry investments are creating opportunities, students should evaluate whether these roles are accessible to freshers. With the country actively building capabilities in chip design, fabrication, testing, and packaging, many opportunities are expected to be generated in areas like VLSI design, embedded systems, semiconductor testing, and electronics manufacturing.

What skills will be required to secure and sustain these jobs?

Students need a balanced combination of strong fundamentals, practical skills, and adaptability. The most important is domain-specific skills based on Interest. Students should develop expertise in at least one high-demand area such as

VLSI/Semiconductor Design (Verilog/VHDL, Digital design, basics of EDA tools); Embedded Systems (Microcontrollers, C programming, Arduino/Raspberry Pi); Communication Systems (Wireless technologies and 5G/6G basics, networking fundamentals); and IoT and Hardware Integration (Sensor interfacing, real-time systems).

Will these jobs be automated in the future?

While automation is certainly entering the electronics and semiconductor industry, especially in areas like manufacturing, testing, and routine verification, it will impact repetitive and low-skill jobs. Jobs that involve design and development (VLSI, circuit design, system architecture), design verification, research and integration of hardware with AI and soft-

ware systems are much less likely to be automated and will remain in high demand. There will be an increasing need for engineers who can design, optimise, and manage complex systems, rather than just operate them.

How challenging are core ECE subjects?

With good teaching, hands-on practice, and the use of simulation tools, core ECE subjects are highly manageable and intellectually rewarding. Breaking concepts into smaller parts, solving numerical problems, and working on practical applications significantly improve understanding.

What are the career paths available after ECE?

As one of the most versatile engineering branches, ECE offers diverse opportunities within core electronics roles as well as interdisciplinary and emerging technology domains. Some of the highly demanded jobs are Verification Engineers, Physical Design Engineers, Embedded Systems Developers, 5G Applications Engineers, and Automation Engineers. Students who build strong fundamentals, gain hands-on experience, and develop industry-relevant skills will progress quickly. Internships, projects, and continuous upskilling further enhance career opportunities.

The writer is the head of department of Electronics and Communication Engineering at JK Lakshmiipat University, Jaipur

innovation, circuit design, hardware at the component level – will find Electronics Engineering the more natural path. It is foundational work, and it remains indispensable.

Those who want to work on the intelligence layer – making devices respond, adapt, and process information in real time – will find Embedded Systems closer to where immediate demand is concentrated. The field rewards engineers comfortable moving between hardware and software, thinking in systems rather than components.

What both paths share is the expectation that a Master’s degree is a period of doing, not a credential to be collected. Students who choose programmes built around real industry problems, and who arrive with genuine clarity about which kind of engineer they want to become, will find the label on their degree matters far less than what they built during it.

The writer is Business Director for India at SRH University Germany.

ON THE SHELF

■ **Chand Bibi: The Lives and Legends of a Warrior Queen**

In 1595, Chand Bibi, queen-regent of Ahmadnagar, defended the Deccan against Mughal imperial expansion, emerging as one of the most formidable political and military figures of 16th century India. Yet history preserves her only in fragments. Or did she disappear altogether? Drawing from archival research, oral histories, and historical landscapes, this book reconstructs Chand Bibi’s life while opening a larger inquiry into how history itself gets written and expanding conversations around sovereignty, gender, and histories often left outside mainstream narratives of India’s past.
