Five Shifts Redefining the Indian Investor Landscape

Markets rarely announce a regime change. It becomes visible through shifts in ownership, leadership, valuations and investor behaviour. Nine months into 2026, Indian equities are showing signs of just such a transition.

The year began with the Nifty 50 at a record closing high of 26,328.6 on January 2, 2026. By September 15, 2026, it had fallen to 23,118.6, roughly 12 per cent below that peak, as geopolitical tensions, crude oil above USD 100 a barrel, rising global bond yields and risk aversion pressured equities. The message is clear that a resilient economy does not guarantee uninterrupted market returns.

The first major shift is the growing weight of domestic capital. In March 2026, domestic institutional investors owned 19.6 per cent of NSE-listed companies, compared with 15.8 per cent for foreign portfolio investors. The shift strengthened further by June, when DII holdings in the Nifty 500 reached a record 21 per cent, against 17 per cent for foreign investors. Regular SIP flows, mutual funds and insurance money are giving Indian markets a deeper domestic liquidity base. Foreign selling can still trigger volatility, but it no longer has the outsized influence it once did.

Second, India is competing harder for global money. International investors can choose between several growth markets, including Taiwan and South Korea, which offer more direct exposure to semiconductors and the global AI cycle. India's long-term growth story remains compelling, but valuation can no longer be secondary. For retail investors, the lesson is simple, that a good company is not automatically a good investment at every price.

Third, retail behaviour is becoming more selective. Weaker cash market activity has coincided with rising interest in gold, silver and other diversifying assets. That need not imply declining faith in equities. It may instead reflect a gradual shift from pure return chasing towards asset allocation. The challenge is to distinguish genuine diversification from simply moving into whichever asset performed best most recently.

Fourth, market leadership is becoming less predictable. Indian IT is the clearest example. Even after a strong rebound on September 15, 2026, the Nifty IT index remained down about 21 per cent in 2026, hurt by fears that generative and agentic AI could weaken the traditional labour-intensive outsourcing model.

AI can improve developer productivity, reduce manpower requirements and challenge time-based billing. But it also increases demand for integration, cybersecurity, governance, data protection and redesign of business processes. Indian IT companies with deep enterprise relationships may benefit if they can move from selling effort to delivering measurable outcomes. The winners will be those that build intellectual property, strengthen AI implementation capabilities and protect margins while changing their revenue models.

The fifth shift is one of investor mindset. In a market where easy narratives are being questioned, portfolio quality matters more than index targets. The key question is not whether the Nifty reaches 27,000 or 28,000 next. It is whether the businesses in a portfolio can grow earnings, defend competitive advantages and justify the valuations investors are paying.

The lasting lesson of 2026 may be that Indian equities are becoming stronger by becoming more demanding. Capital is no longer rewarding every growth story indiscriminately. Earnings, balance sheet quality, cash flows, capital efficiency and valuation are returning to the centre of the investment discussion.

For you, that is not bad news. A more selective market rewards patience, diversification and discipline. The opportunity is no longer simply to own the right story. It is to own the right business, at the right price, with enough resilience to stay invested when the story goes out of favour.

Decoding Management Quality

I was reading your story on mid-caps in the last issue, where you mentioned the factors investors should watch. I understood the quantitative factors, but I am not clear about how to assess management quality. Could you please explain how an investor can evaluate it?

- Bhargavee Pandit

Editor Responds: Management quality cannot be judged through a single ratio, but investors can assess it by examining how consistently the management acts in the interest of shareholders. Start by studying the company's annual reports, particularly related-party transactions, promoter remuneration, auditor observations, pledging of shares and capital allocation decisions. Check whether management has a history of delivering on its stated targets and whether its communication is transparent during both good and difficult periods. Investors should also examine how the company uses capital, whether acquisitions create value, and whether debt is managed prudently. Comparing management's past promises with actual financial performance can provide valuable insights. Ultimately, consistency, transparency, integrity and shareholder-friendly capital allocation are key indicators of management quality.

Market Watch

Growth at Home, Chaos Abroad: Markets Feel the Strain

The dominant story of the fortnight was the escalation in the global energy supply crisis, which kept crude prices elevated and weighed on risk sentiment. On September 10, Saudi Arabia shut down its East-West pipeline after it came under aerial attack. The pipeline, which carries roughly 5 million barrels per day of crude to the Red Sea coast, had been serving as a key bypass route for shipments unable to transit the Strait of Hormuz. A day later, the United Kingdom Maritime Trade Operations Centre reported another tanker fire near the Strait following a fresh attack. By September 11, Brent crude was trading around USD 104.61 per barrel, while WTI was near USD 100, keeping concerns over further supply disruptions firmly in focus.

Against this backdrop, Indian benchmark indices ended the fortnight lower. The BSE Sensex declined 3.21 per cent to 74,781.76, while the Nifty 50 fell 3.22 per cent to 23,398.10. Geopolitical uncertainty, elevated crude prices and foreign selling remained the key pressure points. Institutional flows, however, offered some support. FIIs recorded net sales of ₹7,407.13 crore over the fortnight, while DIIs bought equities worth ₹24,598.38 crore, more than three times the foreign outflow.

Weakness was also visible across most sectors. IT was the worst performer, falling 7.19 per cent, followed by Realty with a decline of 6.34 per cent. Auto lost 5.26 per cent, while Metal slipped 4.12 per cent as concerns over global growth and higher energy costs weighed on cyclical sectors. FMCG declined 3.33 per cent. Power and Healthcare held up relatively better, slipping just 0.22 per cent and 0.69 per cent, respectively.

Bankex fell 1.44 per cent, while Oil & Gas declined 1.47 per cent despite the sharp rise in global crude prices.

Domestic macroeconomic data, meanwhile, remained supportive. India's Q1 FY27 GDP data, released by MoSPI on August 31, showed real growth of 7.8 per cent year-on-year, ahead of the RBI's 7 per cent forecast. Manufacturing expanded 9.2 per cent, while gross fixed capital formation grew 11.9 per cent, pointing to healthy investment activity. August GST collections also remained strong at ₹1,99,853 crore, up 14.8 per cent year-on-year.

Global monetary policy added another layer of uncertainty. US CPI data released on September 11 showed headline inflation at 3.4 per cent year-on-year, keeping the possibility of a Federal Reserve rate hike at the September FOMC meeting in focus.

Strong GDP and institutional buying cushioned markets, but Middle East tensions kept indices lower.

Going ahead, crude oil prices, the duration of the Saudi pipeline shutdown, the Federal Reserve's September decision and the October RBI MPC meeting will remain the key triggers for Indian markets.

Disclosures: www.dsij.in/disclosures

Lumax Auto Technologies Ltd

DIVERSIFIED AUTO COMPONENTS POWERING GROWTH

HERE IS WHY

Strong Q1 earnings momentum

Future-tech content driving margins

Rising OEM wallet share

India's automotive industry started FY27 on a strong footing, with vehicle production rising 22 per cent YoY in Q1 FY27. This favourable operating environment, alongside increasing vehicle premiumisation, localisation and technology content, provides a supportive backdrop for auto-component manufacturers. Hence, we recommended Lumax Auto Technologies Ltd. for this issue of the magazine as a Choice Scrip.

The company has transformed from a predominantly lighting-focused supplier into a diversified auto-component manufacturer. Its portfolio now covers areas such as cockpits, consoles, gear shifters, sensors, antennas, telematics and CNG delivery systems. The company has also strengthened its technology capabilities through strategic joint ventures, the 100 per cent acquisition of IAC India and the SHIFT technology centre focused on software-defined vehicles, ADAS and connected mobility.

The company delivered a strong start to FY27, with Q1 revenue rising 33 per cent YoY to ₹1,364 crore. EBITDA increased 51 per cent to ₹205 crore, with the margin expanding by 190 basis points to 15.1 per cent, while PAT rose 83 per cent

CHOICE

1 YEAR INVESTMENT HORIZON

to ₹99 crore. The improvement was broad-based, with Advanced Plastics revenue increasing 47 per cent to ₹769 crore, Mechatronics growing 56 per cent to ₹84 crore and Structures & Control Systems rising 20 per cent to around ₹218 crore. Alternate Fuels and After-market also grew 17 per cent and 6 per cent, respectively.

A key growth driver is increasing wallet share with existing OEM customers, supported by premiumisation and localisation. Management highlighted four major growth levers, including higher wallet share, greater value content per vehicle, localisation of imported components and the introduction of new technology products. The company is also expanding its presence in intelligent and connected mobility, with five new products planned over the next 18 to 24 months. The Body Control Module has

already been launched.

Mechatronics offers particularly strong optionality. The segment currently has an order book of around ₹500 crore, while management expects the division to generate around ₹400 crore in revenue in FY27 and approach ₹1,000 crore by FY31. Greenfuel is another growth engine, with Mahindra added as a new passenger-vehicle customer for CNG delivery systems. The consolidated order book stood at approximately ₹1,600 crore, providing revenue visibility. Around 25 to 30 per cent of the order book comprises newer technologies linked to the future of mobility, which management expects to support margin expansion. The company plans around ₹300 crore of capex in FY27, primarily for the upcoming Mechatronics and IAC expansions.

The balance sheet remains manageable, with a debt-to-equity ratio of 0.32. The stock trades at 41.1x earnings, above both the industry P/E of 29.1x and its three-year median P/E of 29.6x. The premium valuation means the investment thesis is dependent primarily on sustained earnings growth rather than multiple expansion. However, with 43.4 per cent three-year profit growth, 26.4 per cent ROE and management targeting around 20 per cent revenue CAGR over the long term, earnings growth provides the basis for the current premium.

Management has also indicated that 17 to 17.5 per cent EBITDA margins, alongside around 20 per cent growth over the next three to five years, would represent a satisfactory trajectory. While the valuation leaves limited room for disappointment, the combination of earnings visibility, new technology-led opportunities and margin potential supports our **BUY** recommendation.

Anlon Healthcare Ltd.

SCALING BEYOND API's

HERE IS WHY

Moving Up the Value Chain

Capacity-Led Growth

CDMO and Regulatory Tailwinds

India's pharmaceutical manufacturing sector remains well placed, supported by global demand for cost-efficient supply chains and the China Plus One opportunity. Anlon Healthcare (Anlon) is positioned as a research-driven manufacturer of high-purity pharmaceutical intermediates and APIs, with a growing presence across custom manufacturing, finished dosage formulations and industrial and fine chemicals. It operates across 15 countries with capabilities in R&D, regulatory compliance and specialised API manufacturing.

Anlon's business is evolving from an API and pharmaceutical-intermediates-focused manufacturer into a more integrated pharmaceutical platform. The acquisition of Remember India Health Links, completed in May 2026, provides entry into finished dosage formulations across tablets, capsules and ointments, along with access to more than 30 formulation dossiers. Apiqo Organics strengthens backward integration for critical intermediates and industrial and fine chemicals, while Bizotic Lifescience provides a ready-to-operate facility that can accelerate capacity addition. Together, these acquisitions have taken installed capacity to approximately 1,400-1,600 MTPA.

LOW
PRICED SCRIPT
1 YEAR INVESTMENT HORIZON

The company's growth outlook is supported by expanding capacity, product launches and a broadening R&D pipeline. Anlon plans to add seven new APIs in FY27 and file three to five additional DMFs, strengthening its presence across therapeutic categories and regulated markets. It also has 65 commercialised products, 28 in pilot stage and 49 under laboratory testing.

The CDMO opportunity is a medium-term catalyst. Anlon has end-to-end capabilities from process development to commercial production and is developing specialty molecules for global innovators. Management indicated that one CDMO molecule remains on track for commercial supply by Q3 FY27, with two additional molecules expected around Q4 FY27 or Q1 FY28. The industrial and fine chemical business through Apiqo is already fully booked or overbooked, with management expecting ₹120 crore to

₹150 crore of FY27 revenue from this vertical.

Financial momentum has strengthened materially with the consolidation of acquisitions. Q1 FY27 consolidated total income rose to ₹87.62 crore from ₹33.31 crore in Q1 FY26, while EBITDA increased to ₹15.65 crore from ₹6.26 crore and PAT rose to ₹8.28 crore from ₹3.55 crore. EBITDA margin stood at approximately 17 per cent.

Management expects FY27 revenue of ₹350 crore to ₹400 crore and has indicated a potential ₹700 crore revenue level in FY28 if the planned expansion is completed on schedule. It is targeting EBITDA margins of approximately 25 per cent to 27 per cent in FY27.

Principal risks include volatility in petroleum-linked raw material costs, execution delays and integration risk. Management noted that solvents and petroleum-derived inputs account for roughly 40 per cent of API manufacturing costs, making crude prices, the rupee and freight costs important margin variables. Working capital is another monitorable, with management indicating that trade receivable days could remain elevated at 170 to 180 days. The company also carries approximately ₹70 crore of debt at an interest cost of around 8.5 per cent to 8.6 per cent.

The stock trades at a P/E of 34x, broadly in line with the industry P/E of 34.8x, while ROCE stands at 20.8 per cent. The combination of capacity expansion, acquisitions, regulatory filings and potential CDMO monetisation provides support for future earnings growth. Keeping the above factors in mind, we recommend **BUY**.

The scrips in this column have been recommended with a 15-day investment horizon in mind and carry high risk. Therefore, investors are advised to take into account their risk appetite before investing, as fundamentals may or may not back the recommendations.

Emcure Pharmaceuticals Ltd.

CMP - ₹1,994.15

BSE CODE 544210 | Volume 30,066 | Face Value ₹10

Target ₹2,150 - ₹2,190 | Stoploss ₹1,850 (CLS)

Emcure Pharmaceuticals is a research-driven Indian pharma company with a strong presence across domestic formulations, Europe, Canada, and other international markets. In Q1 FY27, revenue grew 22.8 per cent year-on-year to ₹2,580.4 crore, while EBITDA rose 25.8 per cent to ₹508 crore. PAT increased 36.2 per cent to ₹292.5 crore, with the margin improving to 11.3 per cent. International business remained the key growth driver, rising 34.2 per cent, while domestic revenue grew 10.2 per cent. The company also completed the acquisition of the remaining 12.05 per cent stake in Gennova Biopharmaceuticals for ₹231.87 crore, making it a wholly owned subsidiary. Emcure also received CDSCO approval for Pozvitra for the treatment of MASH, strengthening its specialty portfolio. With healthy earnings growth, improving margins, and continued investments in R&D, the company

GMM Pfaudler is a global engineering solutions provider catering to the chemical and process industries, with a diversified presence across India and international markets. In Q1 FY27, the company reported consolidated revenue of ₹924.76 crore, up 16.4 per cent year-on-year, supported by healthy growth across geographies. Profit before tax increased 27.2 per cent to ₹40.20 crore, while profit for the period more than doubled to ₹22.10 crore from ₹10.15 crore in the corresponding quarter last year. Overseas revenue remained the key growth driver, rising 20.4 per cent to ₹699.63 crore, while India revenue increased 5.5 per cent to ₹225.13 crore. The company also reported order intake of ₹1,007 crore, with its order backlog standing at ₹2,289 crore, up 20 per cent year-on-year, offering healthy revenue visibility. In August, its wholly owned subsidiary repaid EUR 7 million of debt through internal accruals, further strengthening the balance sheet. Considering these positives, we recommend **BUY**.

NIFTY Index Chart Analysis

Nifty Slides Towards Lower End of Five Month Range; 23,070 Support in Focus

The Indian equity market faced pressure during the last fortnight as rising crude oil prices and higher global bond yields weighed on investor sentiment. Crude oil prices remained above the USD 100 per barrel mark, while borrowing costs in the U.S. climbed to their highest levels since the 2008 financial crisis, with the 10 year U.S. Treasury yield moving above 5 per cent. The escalation in geopolitical tensions pushed oil prices higher, increasing concerns over inflation and keeping pressure on global central banks to maintain a tighter monetary policy stance. Markets are closely tracking upcoming policy decisions, with expectations of further rate action from major central banks.

Roadmap for the Next 15 Days			
Ideas	Nifty Levels	Action to be Initiated	Probable Targets
Resistance for the medium-term	23,267 — 23,380	Close above the level of 23,267 — 23,380 would be positive for Nifty	23,572 — 23,623
Support for the medium-term	23,070	Any slip below 23,070 on a closing basis would result into resumption of down move.	22,570

This decisive move has erased the support witnessed during Friday's session and has pushed the index closer to the lower end of the five month consolidation range.

The Nifty is currently trading below its key short term, medium term and long term moving averages, highlighting weakness in the broader structure. On the weekly chart, the index extended its losing streak for the fifth consecutive

over the past five months. A sustained close below this zone could further weaken the market structure and open the possibility of a deeper correction. On the upside, immediate resistance is placed in the 23,267 to 23,380 range. The index needs to move above and sustain this zone for signs of short term stabilisation to emerge.

Above this, the 23,572 to 23,623 zone remains a key hurdle. This area coincides

Since the August 3 high, the Nifty has corrected nearly 1,655 points, translating into a decline of around 6.68 per cent. During this decline, the index breached several important support levels. It first slipped below the rising trendline support connecting the April, June and July swing lows, followed by a breakdown from the broader channel marked by the yellow dashed trendline. The breakdown was accompanied by a large bearish candle that closed near the day's low, indicating strong selling pressure.

week, matching its longest weekly decline of CY2026. The Nifty had previously recorded a similar five week losing streak between February and March. The index is now trading below its 20 week, 50 week and 100 week moving averages, reflecting sustained pressure across multiple timeframes.

Going ahead, the 23,070 level will remain a crucial support zone for the index. This level represents the lower boundary of the broader consolidation range formed

with the downside gap formed on September 9 and may continue to attract selling pressure during any recovery attempt. The 14 period daily RSI has declined to 22.23, indicating that the index has entered deeply oversold territory. While oversold readings from momentum indicators such as RSI and weekly Stochastics suggest the possibility of a short term bounce, the continued rise in volatility indicates that selling pressure remains dominant.

At present, the overall market structure remains weak, with the Nifty trading below major moving averages and momentum indicators favouring further caution. Any recovery attempt will need to clear the immediate resistance levels before the short term trend shows meaningful improvement.

STOCK RECOMMENDATIONS

HYUNDAI MOTOR INDIA LTD. BUY CMP ₹2,140.00

BSE Code : 544274 | Target 1 ₹2,260 | Target 2 ₹2,350 | Stoploss....₹2,110 (CLS)

Hyundai Motor India Ltd. (HMIL) is one of the leading players in the Indian passenger vehicle market and serves as an important manufacturing and export base for its parent company, Hyundai Motor Company (HMC), South Korea. The company has established a strong presence in India, particularly in the Sport Utility Vehicle (SUV) segment, which contributes significantly to its domestic sales volumes. HMIL operates advanced manufacturing facilities along with a dedicated research and development centre, supporting its focus on multiple powertrain technologies, including petrol, diesel, CNG and electric vehicles (EVs).

From a technical perspective, the stock witnessed a breakout above a one month long horizontal resistance zone with a gap up opening, after which it moved higher to test the ₹2,281 level. Following this rally, the stock entered a corrective phase. The correction found support near the 50 per cent retracement level of the previous move, calculated from the July 24 low to the August 27 high. Historically, the rising 50 DMA has acted as a reliable support zone for the stock, and the current price action indicates that the stock is trading close to this key moving average, offering a potential entry opportunity.

Considering the technical setup and support levels, we recommend buying the stock with a stop loss of ₹2,110. The upside targets are ₹2,260, followed by ₹2,350.

TATA TECHNOLOGIES LTD. BUY CMP ₹758.20

BSE Code : 544028 | Target 1 ₹807 | Target 2 ₹840 | Stoploss....₹736 (CLS)

Tata Technologies is a global product engineering and digital services company that assists manufacturers in designing, developing and delivering next generation products. The company works with global original equipment manufacturers (OEMs) and enterprises across sectors such as automotive, aerospace, industrial machinery and other manufacturing industries.

On the technical front, the stock broke out of an ascending triangle pattern in August, supported by strong volumes, and quickly achieved the measured target of the pattern. After the breakout, the stock witnessed a pullback towards the breakout zone, which is a common feature after a sharp upmove. The correction has taken place on relatively lower volumes, indicating that the selling pressure remains limited and the current decline appears to be a normal retracement rather than a change in trend.

On the daily chart, the stock is trading near the lower Bollinger Band, while on the weekly timeframe it is taking support around its 20 week moving average. These technical factors suggest that the stock is approaching an important support zone. Considering the above factors, we recommend buying the stock with a stop loss of ₹736. The target range for the stock is ₹807 to ₹840.

One 97 Communications Ltd. (PAYTM)

Paytm Has Crossed the River. Now It Has to Climb the Mountain.

The Paytm Payments Bank Ltd. (PPBL) nightmare is over. The next chapter depends on whether execution can outrun expectations already baked into the stock

Paytm has delivered one of the most striking recoveries among India's listed new-age companies. From a low near ₹310 in May 2024, the stock has risen roughly 60–68 per cent over the past six months and now trades in the ₹1,670–1,740 range, having touched a fresh 52-week high near ₹1,753 in early September 2026. Market capitalisation stands at approximately ₹1.07–1.11 lakh crore.

The most visible near-term catalyst is renewed discussion around the possible return of Merchant Discount Rate (MDR) on a limited set of higher-value UPI merchant transactions. In August 2026, the government clarified that consumers and person-to-person transfers would remain free, while any future charge would apply only to selected merchant payments above a threshold and at a nominal rate. Legislative enablement is already in place.

Yet MDR is not the foundation of the recovery. Paytm has already returned to full-year profitability without a blanket UPI

MDR. Processing margins have stabilised above 4 basis points, financial-services distribution is growing rapidly, the company has fully migrated to a multi-bank model, and it holds a substantial cash balance. The central investment question has therefore changed. It is no longer about survival. It is whether the current rate of monetisation improvement is sufficient to justify the expectations already reflected in the share price.

From Listing Disappointment to Regulatory Shock

Paytm listed in November 2021 at an IPO price of ₹2,150. The stock opened at ₹1,955 and closed its first day significantly lower as investors questioned valuation, persistent losses and competitive intensity. The decline continued for years, culminating in a low of around ₹310 in May 2024.

The most damaging episode was the Reserve Bank of India's action against Paytm Payments Bank Ltd. (PPBL). From March 15, 2024, the bank was barred from accepting fresh deposits or

top-ups into customer accounts, wallets and FASTags. The banking licence was finally cancelled in April 2026. Although PPBL was a separate associate, it was deeply integrated into Paytm's ecosystem. Paytm Wallet, PPBL-issued FASTag and several settlement flows depended on it. These products had contributed higher-margin volumes and customer stickiness. Their disruption forced a rapid migration of UPI handles and merchant infrastructure to partner banks. The economics of the old Wallet and FASTag businesses could not be recreated. The share-price impact was severe because the market simultaneously priced in lost revenue, operational upheaval and lasting regulatory overhang. The episode accelerated the shift to a cleaner multi-bank operating model.

In parallel, Paytm simplified its portfolio. In 2024, it sold the movie, sports and events ticketing business to Zomato (now Eternal) for ₹2,048 crore. That business had contributed ₹297 crore of revenue and ₹29 crore of adjusted EBITDA in FY24. The proceeds strengthened the balance sheet and reinforced concentration on payments and financial-services distribution.

The Business Model Today

Paytm is best understood as a payments-led platform with three monetisation layers.

Merchant payments form the core acquisition engine. Paytm onboards merchants through QR codes, Soundbox devices, card machines and online payment solutions. Revenue comes from two sources: a processing margin on the value of transactions and monthly subscription fees charged to device-using merchants. These subscription fees flow directly into net payment revenue. Merchant Gross Merchandise Value (GMV) reached ₹23.8 lakh crore in FY26, up 26 per cent, and accelerated to ₹7.1 lakh crore in the June 2026 quarter, up 31 per cent. The subscription merchant base stood at 1.51 crore at the end of FY26 and 1.57 crore by the end of June 2026.

Financial-services distribution is the second, higher-margin engine. Paytm partners with banks and NBFCs to distribute merchant loans, personal loans, Postpaid, credit cards, insurance, broking and wealth products. Lending partners underwrite and carry the loans on their balance sheets. Paytm earns distribution fees and benefits from its existing merchant relationships and transaction data, which lower customer-acquisition costs. This segment is relatively capital-light.

The third layer comprises advertising, travel, wealth and other services. The operating logic is a classic flywheel: payments bring users and merchants onto the platform, devices deepen daily engagement, and financial products raise monetisation per relationship. Judging Paytm solely by the take rate on a pure UPI transaction therefore misses the larger economic design.

On the consumer UPI side, Paytm remains a distant third. PhonePe and Google Pay together still control roughly 79–80 per cent of transaction volume, with PhonePe around 46 per

cent and Google Pay around 33 per cent. Paytm's share is typically in the 7–8 per cent range. Its relative strength lies more on the merchant and device side than in pure consumer P2P volume. The large installed base of Soundboxes and QR codes gives Paytm a structural advantage in merchant engagement and in cross-selling loans, even if its pure UPI volume share remains smaller than the two leaders.

Payment Margins: History, Reality and Trajectory

MDR is the fee a merchant pays for accepting digital payments. Paytm's reported payment processing margin of more than 4 basis points of GMV is already the net figure retained after banks, networks and other intermediaries have taken their share. In practical terms, a 4 bps margin means the company keeps approximately 0.04 per cent of the value it processes. Net payment revenue is the sum of this processing margin and the monthly device subscription fees.

A critical historical point is often misunderstood. Ordinary UPI merchant MDR was set to zero in January 2020, before Paytm's IPO. The company never earned a steady 7–9 bps on post-listing volumes only to lose it when MDR was abolished. The high margins of FY23 and early FY24 were driven by a richer mix that included Wallet, cards, EMI and Postpaid. By FY25, ordinary UPI accounted for 80–85 per cent of payment GMV. The PPBL restrictions removed the remaining higher-margin Wallet and FASTag economics and accelerated the mix shift towards lower-yield UPI.

The financial consequence was clear. Payment-services revenue fell from ₹6,235 crore in FY24 on GMV of ₹18.3 lakh crore to ₹4,039 crore in FY25 even as GMV rose to ₹18.9 lakh crore. Monetisation weakened; scale did not.

Since the trough, margins have recovered. After dipping to a little above 3 bps, the processing margin has stabilised comfortably above 4 bps. Management attributes the improvement to pricing discipline and faster growth in credit cards on UPI and EMI products. A pure bank-account UPI transaction still offers thin economics. The same QR used with a RuPay credit card or an EMI facility can generate a meaningfully higher take rate. Continued growth in these higher-yield instruments can therefore lift the blended margin without any change in regulation.

Device subscription yields have also declined from earlier levels that approached ₹100 per merchant per month. Lower hardware costs, higher refurbishment rates and more competitive acquisition pricing have reduced average monthly revenue per device. Paytm now evaluates merchants on lifetime value rather than rental income alone. Lower immediate subscription revenue is acceptable if the merchant stays longer, processes more volume and eventually takes a loan.

The realistic framework for investors is therefore

straightforward. The old 7–9 bps range is not a normalised target given today's UPI-heavy mix and competitive intensity. The current base above 4 bps is credible. Gradual movement towards 5 bps through mix improvement is possible. On quarterly GMV of ₹7.1 lakh crore, each additional basis point of processing margin is worth roughly ₹71 crore of quarterly revenue, or about ₹284 crore on an annualised basis before further GMV growth.

Selective MDR as Optional Upside

Any reintroduction of MDR is likely to be narrow. The government has been clear that consumers and P2P transfers will remain free and that charges would apply only to higher-value transactions at larger merchants. The majority of merchant UPI volume is expected to stay outside the framework. Investors should not multiply Paytm's entire GMV by a hypothetical rate. The final threshold, eligible merchant set, headline rate and revenue-sharing formula are still undecided, and Paytm would retain only a portion of any fee collected.

Analyst estimates typically assume a headline rate of 25–40 basis points on a subset of value and net retention for Paytm of 3–4 basis points. That could add several hundred crore of EBITDA over the medium term, but both quantum and timing remain uncertain. The important point is that the business is already generating a positive processing margin without a blanket UPI MDR. Selective MDR would be incremental, not foundational.

Financial Services: The Higher-Margin Engine

Distribution of financial services is becoming increasingly material to overall profitability. Revenue grew 52 per cent to ₹2,594 crore in FY26 and rose another 45 per cent year-on-year to ₹814 crore in the June 2026 quarter.

Merchant lending is the most natural extension of the payments franchise. Existing QR and Soundbox relationships give Paytm low-cost distribution and rich transaction data that partner lenders can use for underwriting. Repeat borrowers further improve unit economics because acquisition costs do not have to be incurred again. The model remains capital-light because partners hold the loans, yet it is not risk-free. Results depend on lender appetite, portfolio performance and collections. Some arrangements have involved Default Loss Guarantee structures. Growth in financial-services revenue and the number of active customers therefore matter more than headline disbursement numbers.

Profitability, Cash and Operating Leverage

FY26 was the first full year of profit. Operating revenue rose 22 per cent to ₹8,437 crore. EBITDA swung by ₹2,008 crore to a positive ₹502 crore (6 per cent margin). Profit after tax was ₹552 crore.

The June 2026 quarter showed further acceleration: revenue of ₹2,448 crore (up 28 per cent, or 31 per cent on a comparable basis excluding residual incentives), contribution profit of ₹1,350 crore, record quarterly EBITDA of ₹203 crore (8 per cent margin), and PAT of ₹220 crore (up 79 per cent). Merchant GMV grew 31 per cent. Consolidated cash stood at ₹13,529 crore at the end of June 2026. The balance sheet is essentially debt-free, with a debt-equity ratio of 0.01.

This cash position gives Paytm meaningful strategic flexibility. Management has indicated that the priority is organic investment in merchant acquisition, product development and technology, while remaining open to selective acquisitions only at attractive valuations. The absence of meaningful debt also reduces refinancing or interest-rate risk and provides a buffer against any temporary regulatory or competitive pressure.

The next phase of earnings growth depends on operating leverage. As payments and financial-services revenue continue to scale, employee costs, technology spend and other indirect expenses are expected to rise more slowly than the top line. The resulting expansion in EBITDA margin can be substantial. Artificial-intelligence tools are already being used to improve onboarding, fraud detection, collections and marketing efficiency, supporting this cost discipline.

Valuation, Competition and Risks

At the current share price, the market capitalisation is ₹1.07–1.11 lakh crore against a cash balance of more than ₹13,500 crore. Trailing earnings multiples remain elevated, well above 150 times even after incorporating the latest quarter. Such multiples can compress rapidly if profits compound, but they also show that substantial future growth is already priced in.

Competition remains intense. PhonePe and Google Pay dominate consumer UPI volume. On the merchant side, specialised players continue to compete for device deployment and lending distribution. Residual regulatory risk cannot be ignored after the PPBL experience, even though the core business has been structurally separated. Credit quality in the financial-services book and the willingness of lending partners to continue scaling are additional variables. Any MDR framework that is narrower or less profitable than current market hopes would remove one source of upside. Finally, execution risk remains: the company must keep converting its large merchant base into higher-margin financial products while defending device relationships against aggressive competitors.

What Successful Execution Would Look Like

Over the next two to three years, a successful outcome would involve sustained mid-to-high teens or better revenue growth, processing margins holding above 4 basis points and ideally drifting higher through credit-led mix, continued expansion

of the subscription merchant base, and financial-services revenue growing faster than the overall company. Operating leverage should then allow EBITDA margins to expand meaningfully from the current high-single-digit level.

Delivery against this trajectory, combined with a stable regulatory environment, would support further re-rating. Failure to improve mix, a slowdown in financial-services growth, or renewed regulatory friction would leave the current valuation looking demanding.

Shareholding Pattern Trend

Shareholding has shifted meaningfully over the past year. Foreign institutional ownership has declined steadily from over 54 per cent in mid-2025 to around 48 per cent by June 2026. In contrast, domestic institutions have been consistent buyers; mutual fund holdings rose from about 16 per cent to nearly 18 per cent, while overall domestic institutional ownership climbed towards 25 per cent. Founder Vijay Shekhar Sharma continues to hold roughly 9 per cent. The company has moved to majority Indian ownership (above 50 per cent), reinforcing its Indian-owned and controlled company status. High free float remains, though occasional block sales by early investors can still create temporary supply.

Recommendation

The operational turnaround is genuine. Paytm has moved from

multi-year losses and dependence on a tightly linked payments bank to a profitable multi-bank platform with stabilising processing margins, a growing financial-services engine, and a strong cash position. The share-price recovery reflects these improvements.

The older high-margin payment economics are unlikely to return in full. The realistic base case rests on sustaining processing margins above 4 basis points with gradual mix-driven improvement, continuing to expand the device merchant base even at lower average subscription yields, and converting a rising share of those relationships into financial products. Selective MDR would provide additional earnings torque but is not required for the business to keep compounding.

At present valuations, the market is already demanding continued successful execution. Existing shareholders are therefore advised to **HOLD**. Sequential trends in processing margin, financial-services revenue growth, and any official clarity on the MDR framework are the key variables to monitor.

Fresh capital is better deployed only if valuations become more attractive or if the company demonstrates a clear and sustained acceleration in earnings beyond the trajectory already implied by the current price.

Build Your Fortune Like an Ace Investor

What makes an ace investor different from the crowd? How do they spot the next multibagger before it becomes obvious, and do they see something that most investors miss? These are questions many investors ask. The journeys of India's ace investors offer more than spectacular returns. Let's understand these lessons and how they can help you build your own fortune

Radhakishan Damani ▶

Vijay Kedia ▶

Rakesh Jhunjhunwala ▶

There is something irresistible about a stock that has multiplied several times. The moment an investor discovers that a company has turned into a ten-bagger or even a hundred-bagger, the first instinct is rarely to study the business that created that wealth. Instead, the question often becomes: Who bought it first? Is there a well-known institution or a renowned investor backing the stock? That curiosity has made India's ace investors almost as fascinating as the stocks they own.

From Rakesh Jhunjhunwala's legendary conviction in Titan to Radhakishan Damani's long association with value and consumer businesses, and from Vijay Kedia's search for emerging growth companies to Ashish Kacholia's preference for specialised businesses, their journeys have created a fascinating library of investment lessons.

Yet, beneath the headlines about multibaggers and spectacular fortunes lies a far less glamorous truth. India's most successful investors did not build their wealth simply because they could predict every market move or identify every winning stock before the rest of the market.

Their styles were different, their portfolios varied and their risk appetites were far from identical. Yet, despite these differences, each of them got certain things remarkably right. What were

those common traits, strategies and decisions that helped them create substantial wealth? Let us explore their journeys through real examples and uncover the lessons that today's investors can apply to their own wealth-creation journey.

Rakesh Jhunjhunwala From ₹5,000 to a Fortune

When we think of India's most renowned investors, it is impossible to overlook the late investor, Rakesh Jhunjhunwala. He entered the stock market in 1985 with just around ₹5,000, at a time when India's capital markets were still in their infancy and equity investing was far from being as mainstream as it is today. Starting with such modest capital, his journey would go on to demonstrate how conviction, patience and the power of compounding can turn a small beginning into substantial wealth over the long-term.

Titan became the defining example of his long-term investing philosophy. Jhunjhunwala started accumulating the stock when the company was still a fraction of the business that investors know today. He first bought Titan shares in 2002, at a time when the stock was trading at a fraction of today's price, which now stands at more than ₹5,000 per share. He gradually increased his holding as his conviction in the company's long-term growth strengthened.

Special Report

The Titan Bet That Changed Everything

Source: TradingView

Over the years, Titan strengthened its position in watches and jewellery, expanded its brands, built distribution and benefited from the formalisation and premiumisation of Indian consumption. As the business grew, earnings grew, and the market gradually placed a higher value on those earnings. The extraordinary wealth associated with the investment was therefore not created in a single market rally. It was created over years in which the business continued to become more valuable.

It was not just Titan. Jhunjhunwala held several high-conviction investments for extended periods, staying invested through both bull and bear markets and allowing the power of compounding to work in his favour. This is an important distinction because investors looking at a multibagger often see only the final destination. They see the stock price that has risen hundreds or thousands of per cent, but they often do not see the years when the investment appeared ordinary or the periods when the share price corrected sharply.

Rakesh Jhunjhunwala' Portfolio (Top 5 Holdings) Rakesh Jhunjhunwala, Rekha Jhunjhunwala, Rare Equity Pvt. Ltd.

Company Name	Holding Value (₹ Cr.)	Stake in the Company (June 2026)
Titan Company	23,691.3	5.30%
Inventurus Knowledge	15,102.3	49.30%
Metro Brands	3,727.8	14.40%
Concord Biotech	3,660.9	24.10%
Fortis Healthcare	2,738.9	4.00%

Source: Trendlyne

They do not see the moments when holding the stock required more patience and conviction than excitement, even when the eventual rewards made the journey look effortless in hindsight. That is precisely why the experience of India's ace investors is so valuable for today's generation of investors. Their success

demonstrates that the biggest advantage in investing may not necessarily be superior information or a greater ability to predict the next quarter. It may simply be time.

Vijay Kedia The SMILE Approach

If Rakesh Jhunjhunwala's journey demonstrates the power of long-term conviction, Vijay Kedia offers an equally interesting lesson in identifying businesses that are still relatively small but possess the potential to become much larger. His investment philosophy is often associated with the SMILE approach, which stands for Small in size, Medium in experience, Large in aspiration and Extra-large in market potential.

The framework reflects Kedia's preference for companies that may be modest in size but have experienced management, ambitious leadership and the potential to address large and expanding markets. He has also emphasised the importance of resilience, innovation, scalability and execution, recognising that growth alone is not enough to create sustainable shareholder value. A company can grow rapidly and still destroy capital if it requires excessive investment, carries too much debt or lacks the management capability to convert opportunity into profits.

Neuland Laboratories: How Resilience Turned the Investment Thesis into Reality (₹ Cr.)

	Mar-19	Mar-20	Mar-21	Mar-22	Mar-23	Mar-24	Mar-25	Mar-26	CAGR (%)
Sales	667	763	937	951	1,191	1,559	1,477	2,023	17
Operating Profit	58	102	147	144	273	463	331	580	39
OPM %	9%	13%	16%	15%	23%	30%	22%	29%	-
Net Profit	16	16	81	64	164	300	260	364	56

His investment in Neuland Laboratories provides a striking example of how this approach can work when combined with conviction. Kedia had invested in the company before the Covid-19 market crash and reportedly bought more shares around ₹250 during the market turmoil of March 2020. The stock subsequently rose dramatically, crossing the ₹24,000 mark and turning that reported purchase into a nearly hundred-fold gain. The headline number is extraordinary, but the more interesting part of the story lies in the circumstances in which the investment was made.

March 2020 was a period when uncertainty was everywhere. Economic activity had come to a standstill, markets were collapsing and investors were struggling to understand how businesses would survive the unprecedented disruption. In such an environment, buying a small-sized company requires a completely different temperament from buying after a strong rally has already established a popular narrative. The decision depends on whether the investor believes the underlying business remains capable of emerging stronger once the temporary disruption passes.

That distinction between price movement and business fundamentals is one of the most important lessons investors can take from Kedia's approach. A falling share price does not

automatically make a company attractive, just as a rising share price does not automatically make it expensive. What matters is whether the business has become more or less valuable relative to the price being paid for it.

Vijay Kedia's Portfolio (Top 5 Holdings) Vijay Kedia, Kedia Securities Pvt. Ltd.		
Company Name	Holding Value (₹ Cr.)	Stake in the Company (June 2026)
Neuland Laboratories	309.1	1.00%
Atul Auto	260.5	20.90%
Sudarshan Chemical	126.2	1.30%
Elecon Engineering	94.1	1.00%
Yatharth Hospital	93.7	1.00%
Source: Trendlyne		

For investors, this means that a market correction should not automatically be treated as either a disaster or an opportunity. Instead, it should trigger a reassessment of the investment thesis. If the business remains strong and the long-term opportunity is intact, a decline in price may create an opportunity. If the business itself is deteriorating, however, a lower price may simply mean that the market is correctly reassessing its prospects.

Radhakishan Damani The Art of Value Investing

Radhakishan Damani represents another school of investing in which simplicity, value and business economics play a central role. Before Avenue Supermarts (DMart) transformed into one of India's best-known retail chains, Damani had already made a name for himself as a respected investor and market participant, with a portfolio of investments across multiple businesses. His investment approach demonstrated the importance of understanding the economics of a business rather than becoming distracted by the excitement surrounding a stock.

Then came DMart. DMart's growth story was never built around a race to add stores at any cost. From its first store in Mumbai in 2002, the company took a measured approach to expansion, spending years refining its value-retail model before accelerating its footprint. By FY14, DMart had just 75 stores, but its footprint expanded steadily as the business model gained scale, taking the store count to more than 500 today.

This relatively cautious expansion was central to DMart's philosophy: establish a store, build customer acceptance, make the economics work and then replicate the model. Rather than chasing a larger footprint simply to appear bigger, the company focused on store productivity, cost efficiency, inventory management and its 'Everyday Low Cost' proposition. That patience helped turn store expansion into a sustainable growth engine, allowing DMart to scale without losing sight of the operating discipline that made each new store viable.

Radhakishan Damani's Portfolio (Top 5 Holdings) Radhakishan Damani, Bright Star Investments Pvt. Ltd.		
Company Name	Holding Value (₹ Cr.)	Stake in the Company (June 2026)
Avenue Supermarts	1,59,977.9	67.10%
Sundaram Finance	1,231.8	2.40%
VST Industries	1,012.3	29.10%
3M	542.6	1.50%
United Breweries	403.9	1.20%
Source: Trendlyne		

By the time Avenue Supermarts came to the public market in 2017, investors were effectively being given an opportunity to participate in a business whose economic model had already been tested for years. The subsequent market performance attracted enormous attention, but the foundation had been built quietly, store by store, through a business model that focused on repeatable economics rather than spectacular headlines.

Damani's journey therefore provides an important lesson for investors who are constantly searching for the next exciting theme. Sometimes the most powerful investment idea is not the one with the most exciting story. It may be the company that simply executes a straightforward business model better than its competitors for a very long time. Boring, when combined with excellent execution, can become beautiful for shareholders.

Different Styles, Same Principles			
Ace Investor	Style	What They Looked For	Key Lesson
Rakesh Jhunjhunwala	Growth + value	Scalable businesses	Stay invested
Vijay Kedia	Growth-oriented	Emerging businesses	Conviction + patience
Radhakishan Damani	Value + simplicity	Strong economics	Buy quality at sensible prices
Common thread	Long-term investing	Business fundamentals	Let compounding work

Copy the Thinking, Not the Stock

The success of India's ace investors has created a powerful temptation among investors: if a legendary investor owns a stock, perhaps owning the same stock can provide a shortcut to similar wealth. Every fresh disclosure of a prominent investor increasing a stake can quickly become market news, with investors trying to interpret the purchase as a signal that the stock could be the next multibagger. In an age when information travels almost instantly, knowing what a famous investor owns has become remarkably easy.

What remains difficult, and far more important, is understanding why they own it. Consider what a retail investor actually knows when a well-known investor appears in a company's shareholding pattern. The purchase price may not be known with certainty, nor the size of the position relative to the investor's overall portfolio. There is no visibility into how long the company was studied, what management interactions took

Special Report

place, what assumptions were made about future earnings or what valuation the investor considered reasonable.

More importantly, the disclosure represents only a snapshot. By the time the information reaches the wider market, the investor may have already changed the position. The difference in risk capacity can be even more significant. An experienced investor may be able to tolerate a 40 or 50 per cent decline in a stock because the position represents only a small portion of a diversified portfolio and because the investor has a well-defined thesis.

A retail investor copying the same idea may allocate a much larger proportion of savings to that stock and consequently experience an entirely different financial and psychological outcome. This is why studying an ace investor should not begin with the question, "What is he buying?" It should begin with "How does he think?". Vijay Kedia's journey can be studied for the characteristics he looks for in businesses and the patience with which he allows an investment thesis to develop.

Radhakishan Damani offers lessons in valuation, business economics and discipline. Rakesh Jhunjhunwala demonstrated the power of combining conviction with a long investment horizon. Other successful investors have followed different routes, looking for specialised businesses, emerging companies or situations where future earning potential is not yet fully reflected in the price. The stocks may be different, the sectors may be different and the entry points may be different. The useful lesson is the decision-making framework behind the portfolio, not the portfolio itself.

What Can an Investor Actually Copy?

The most valuable lesson from India's ace investors is perhaps the easiest to overlook: investors may not be able to replicate their exact investments, but they can adopt the behaviours, discipline and principles that helped make those investments successful.

- **The first is to give compounding enough time to work.** A great investment does not necessarily look extraordinary in its early years. Businesses need time to increase capacity, acquire customers, strengthen competitive advantages and reinvest profits. Investors who constantly switch between themes rarely give any one idea enough time to demonstrate its full potential.
- **The second is to study businesses rather than simply prices.** Before buying a company, an investor should be able to explain what it does, how it makes money, why customers choose it, what could threaten its competitive position and how management allocates capital. Financial statements then become much more meaningful because revenue growth, margins, debt, cash flows and returns on capital are being evaluated in the context of the actual business.

- **The third is to understand the difference between volatility and permanent risk.** A 20 per cent decline in a fundamentally sound company is uncomfortable, but it does not automatically mean that capital has been permanently destroyed. Conversely, a stock that has fallen 50 per cent is not necessarily cheap if the business has deteriorated. Price movement tells us what the market is doing; business analysis helps us determine whether the investment thesis is still intact.
- **The fourth is knowing when patience becomes stubbornness.** Long-term investing does not mean holding a stock indefinitely. If management loses credibility, competitive advantages weaken, debt becomes excessive, cash generation disappoints consistently or the original investment thesis no longer holds, selling can be the more rational decision. Patience means allowing a sound thesis enough time to play out; it does not mean defending a broken thesis.
- **There is also a simple thought experiment that can help investors distinguish between ownership and speculation:** Imagine that you cannot see the prices of your holdings for the next five years. Which companies would you still be comfortable owning? The answer can be revealing. If the inability to check the price creates immediate anxiety, the investment may have been driven more by the stock than by the business. But if the investor can clearly explain with conviction why they own the business, the absence of a daily price may become almost irrelevant.

The Ace Investor Playbook		
Principle	What the ace investors did	What investors can do
Time	Held good businesses for years	Avoid unnecessary churn
Quality	Studied business economics	Analyse fundamentals
Conviction	Added when thesis remained intact	Use market falls intelligently
Patience	Ignored short-term noise	Think in 5-10 year periods
Risk	Accepted volatility	Diversify and control position sizes
Compounding	Allowed earnings to accumulate	Start early and remain invested
Discipline	Sold when thesis changed	Don't fall in love with stocks

Behind Every Stock is a Business

Strip away the famous names, the multibagger returns and the market headlines, and one principle connects many successful investors: they understood that buying a share means buying a fractional interest in a business. That sounds obvious, but it becomes surprisingly easy to forget when markets are rising. Investors begin discussing stocks as if they were independent objects, focusing on price movements, targets and momentum rather than the economics of the companies those shares represent.

Yet over a sufficiently long period, the performance of a stock

“Time is on your side in the stock market. It’s on your side. And when stocks go down, if you’ve got the money, you don’t worry about it and you’re putting more in, you shouldn’t worry about it. You should worry what are stocks going to be 10 years from now, 20 years from now, 30 years from now.”

– Peter Lynch

cannot remain completely disconnected from the performance of the underlying business. This distinction becomes particularly important during market corrections. When the Nifty 50 falls sharply, the immediate instinct is to measure the damage to the portfolio. A business-focused investor asks a different question: has the earning power of the company fallen by the same magnitude as its share price?

If a company's customers remain loyal, its competitive position is intact, its balance sheet remains healthy and its ability to generate cash has not materially deteriorated, a sharp decline in the stock price may represent volatility rather than permanent destruction of value. But if the fall accompanies declining market share, excessive debt, weak cash generation, deteriorating margins or poor capital allocation, the price decline may be highlighting a genuine problem.

This business-first approach also explains why successful investors can sometimes hold a stock through periods that appear uncomfortable from the outside. Their conviction is not necessarily based on an expectation that the share price will rise every quarter. It is based on an assessment of where the business could be several years from now. The same framework helps investors evaluate growth companies. Rapid revenue growth alone does not create wealth for shareholders.

Growth becomes economically meaningful when a company can convert rising sales into sustainable profits and cash flows while earning attractive returns on the capital required to expand. The investor has to determine whether the opportunity is supported by a genuine competitive advantage, an expanding addressable market and capable management, or whether the excitement is simply being created by a temporary growth cycle. In the end, the ticker symbol is only the entry point. The business is the investment.

The Real Secret Behind the Fortunes

That is perhaps the deepest lesson from India's successful investors. Their fortunes were not created merely by finding stocks that went up. They were created by identifying opportunities, sizing risk, surviving mistakes and allowing successful businesses and investment decisions to compound over long periods. The objective, therefore, should not be to

find the next Titan, next DMart or next multibagger owned by an ace investor. Those outcomes cannot be known in advance.

The more useful objective is to develop the ability to recognise a good business, pay a sensible price, understand the risks and remain patient when the underlying thesis continues to hold. Wealth often becomes visible only after years of compounding, but the habits that create it are usually much less dramatic: saving regularly, investing thoughtfully, controlling risk, learning from mistakes and giving time a chance to work.

The stories of India's ace investors are often presented through the spectacular returns they generated, the enormous portfolios they built and the legendary stocks associated with their names. But looking only at the final outcome can obscure the uncertainty that existed when those investments were made. We remember the multibagger but not the investments that were sold at a loss. We remember the calls that worked and forget the uncertainty that existed when those decisions were made. That creates a dangerous illusion of perfection.

Great investors are not people who never make mistakes. They are people who can survive their mistakes, learn from them and remain invested when they identify something genuinely exceptional. The market will always produce another hot theme, another trending stock and another reason to act. Successful long-term investing often requires the opposite response. The greatest lesson from India's ace investors is not to chase their fortunes, but to understand the behaviour that made those fortunes possible.

The stock market will continue to move faster than businesses, and headlines will continue to change faster than earnings. The successful long-term investor has a different advantage: 'they can wait.' And when a good business, a sensible valuation and patient capital come together, time stops being an investor's enemy and becomes the most powerful partner in the portfolio. After reading this story, what mistakes do you think you may have been making, and what new lessons have you learned that could help you build sustainable, long-term wealth? We would love to hear from you!

Databank
Updated Information

Subscribers can access the complete databank consisting of more than 3500 companies on our website www.dsij.in

*** All financial data are taken on standalone basis**

- **Face Value:** Actual cost of the stock assigned by the security issuer and shown in the certificate.
- **Year:** First two digits shows Year while last two digits show month of calendar, eg. 1103 shows March 2011 results.
- **CEqt.:** Current paid up capital of the Co..
- **B.V:** Book Value Per Share: Equity capital plus reserves to the number of equity shares.
- **Sales:** Sales figures includes Excise duty.
- **NP: Net Profit :** Profit after tax but before investment allowance reserves.
- **EPS:** Earnings Per Share: Ratio of net profit less preference dividend to the number of equity shares (Annualised).
- **Div (Rs.):** Indicates the dividend per share.
- **D/E Ratio :** A measure of a Co.'s financial leverage calculated by dividing its total Debt by stockholders' equity.
- **RONW (%) :** Net Profit Divided by Total NetWorth.
- **Latest Quarter:** Indicates the recent quarterly filing of the Co. with the stock exchange.
- **YearToDate :** Latest Results (qtr, half or Nine) of the Co..
- **Sales Growth % :** Indicates the % growth of sales on year-on-year basis.
- **NP Growth % :** Indicates the % growth of Net profit (NP) on year-on-year basis.
- **Promoter Holding:** Indicates the % of equity holding with the promoters of the Co..
- **Promoters pledged shares % :** Indicates the % of shares Pledged by promoters.

Institutional Holding: Indicates the % of equity holdings in the Co. held by Financial Institutions, Banks, Insurance companies, MF's and FIIs.

- **NoShold:** Indicates the Number of Share Holders of the Co.. (In Thousands)
- **Market Cap:** Current market price multiply no. of equity shares.
- **Price:** Current Market Price.
- **52 Week H/L:** High/Low range is taken for the market prices during the 52 week H/L.
- **Enterprise Value :** Current Market Cap Plus Debt Minus Cash and Bank Balances.
- **Trail.P/E Ratio:** Current market price to Trailing 12 months EPS.
- **Ticker:** BSE Scrip Code
- **U:** Unaudited.
- Companies with an (*) following their equity capital have increased their capital after the last financial year.
- Companies with an (*) Before the name of the Co., indicates new addition/ update/correction made during the fortnight.
- **CB:** Cum-Bonus XB: Ex-Bonus.
- **EX:** Ex-Rights wherever the price is indicated a Ex-bonus or Ex-rights, the corresponding figures for equity. Reserves, Book value and EPS are adjusted as per the bonus or the Rights ratio.

Notes: (A) The Profit figure reflects the performance of the current year. We have made the necessary adjustments for the prior year's entries in P/L A/c to reflect the true performance of the current year. Thus our figures may not be comparable with those published elsewhere unless they represent the same thing. (B) Source of information is Co. press releases and Annual Reports.

Birla 2.0: Reinventing the Empire

After transforming cement, metals and manufacturing businesses into global-scale companies, Kumar Mangalam Birla is attempting his most ambitious transition yet, creating consumer and infrastructure franchises in categories dominated by established giants. This deep dive examines the strategy, financial strength, risks and challenges behind the group's biggest expansion phase

Kumar Mangalam Birla
Chairman, Aditya Birla Group

A Group in Expansion Mode

On September 3, 2026, Kumar Mangalam Birla unveiled the Aditya Birla Group's newest bet: Ultravolt, a wires-and-cables brand built under UltraTech Cement, entering a market worth an estimated ₹90,000 crore. Backed by an investment of ₹1,800 crore, Ultravolt did not arrive as a cautious, testing-the-waters entrant; it launched already positioned as the second-largest player in the segment by capacity, with a stated ambition to be among the top two players outright within five years. Birla framed the bet around three structural tailwinds: urbanisation, electrification and digitisation, pointing to the construction of

over 100 million new homes over the coming decade, the expansion of power infrastructure, and the rapid build-out of data centres across India as the demand engines that would justify the wager.

It is the latest, and in some ways the most telling, entry in a pattern that has been building for two years. Birla Opus, the group's paint brand under Grasim Industries, rolled out manufacturing capacity across six plants in barely two years, a build-out speed that took established players a decade to match. Indriya, a jewellery format, opened to compete with Tanishq and Kalyan in a business built on trust earned over generations,

not capacity built in months. Aditya Birla Fashion and Retail demerged its lifestyle brands into a freshly listed entity, Aditya Birla Capital raised fresh equity to fund an insurance and lending push, and now UltraTech, the group's cash-generating cement flagship, has used its own balance sheet to fund a fifth simultaneous front.

None of these moves would qualify as a surprise in isolation. Large Indian conglomerates diversify constantly. What makes this moment different is the pattern: the Aditya Birla Group, built and scaled on commodities, cement, aluminium, viscose fibre and telecom infrastructure, is simultaneously attacking more than a couple of consumer- and infrastructure-facing categories where it has no incumbent advantage, no distribution history and no brand equity to fall back on. Paints, jewellery, fashion retail, wires and cables, and B2B digital platforms have one thing in common: each is dominated by a player, or two, that has spent decades building the exact assets, dealer loyalty, customer trust and distribution reach, that money alone cannot buy quickly.

The current chapter in the Aditya Birla Group's story is something that might puzzle most readers and, hence, deserves a detailed and deep dive rather than a corporate profile. Kumar Mangalam Birla has already done the easier version of this task once: he took a group of textile and commodity businesses inherited in 1995 and turned it into a collection of global-scale, professionally run industrial companies. That was, at its core, a game the group already knew how to play: buy assets, expand capacity, integrate operations and cut costs.

What he is attempting now is structurally harder. It asks a set of engineering-led, capital-intensive businesses to develop something closer to a consumer-goods instinct: brand-building, dealer psychology, retail experience and underwriting discipline. Ultravolt is a partial exception; wires and cables are sold B2B and through dealers much like cement itself, which is precisely why UltraTech, rather than a consumer-facing group entity, is the one running it. The financial numbers in this story, drawn from five years of audited results across ten listed group companies, show a group with genuine balance-sheet strength and cash-generating power. They also show, in at least two of the new-economy bets, the early cost of a strategy that is still unproven. This is a story about whether capital and scale can manufacture leadership in categories that have historically been won by patience and relationships.

The Central Argument

For most of the past three decades, growth at the Aditya Birla Group has followed a familiar script: identify a commodity or industrial category with global scale potential, acquire or expand aggressively, and compete on cost and capacity. Cement, aluminium, viscose staple fibre, carbon black and telecom infrastructure were all built this way. The customer in each of these businesses is either an institutional buyer, a dealer, or, in telecom's case, a price-sensitive retail subscriber acquired through network coverage rather than brand affinity.

The businesses now receiving the group's freshest capital are different in kind. Paint is bought through a decades-old relationship between a homeowner, a painter and a dealer. Jewellery is bought on trust built over generations and guarded jealously by family-run and legacy chains. Fashion retail lives and dies on brand aspiration and store experience. In each of these, the group is not extending an existing advantage; it is building one from a standing start, against competitors who have no intention of ceding share quietly.

That raises the question this story tries to answer: is Kumar Mangalam Birla executing a carefully sequenced transformation of the portfolio, timed to income growth and formalisation trends genuinely underway in India, or has the group taken on too many capital-intensive, low-margin battles at once, at a moment when its older commodity businesses are themselves facing cyclical and margin pressure? The financial data suggests both are true simultaneously, in different parts of the portfolio. That is precisely what makes this a bet rather than a plan.

From Inheritance to Transformation

Kumar Mangalam Birla took charge of the Aditya Birla Group in 1995, at the age of 28, following the sudden death of his father, Aditya Vikram Birla. What he inherited was a group with real industrial scale but a fragmented structure, a collection of textile, fibre, cement and metals businesses spread across dozens of entities, many with overlapping promoter holdings and limited professional-management depth.

His first two decades as chairman were spent consolidating and internationalising that inheritance. Grasim's cement operations were eventually demerged into what is today UltraTech Cement, now India's largest cement maker by capacity. Hindalco's 2007 acquisition of Novelis turned an Indian aluminium producer into the world's largest flat-rolled aluminium and recycling company overnight, still the single boldest capital decision of his tenure, and one that took years to prove out on the balance sheet. Idea Cellular was built into a national telecom operator and then merged with Vodafone India in 2018, a defensive consolidation forced by a brutal price war the group did not start and could not avoid.

Through this period, Birla's capital-allocation instinct was industrial: buy scale, integrate operations, professionalise management, and let global commodity cycles do the rest. What has changed materially in the last five years is the direction of new capital. Instead of adding capacity to businesses the group already dominates, fresh investment is now flowing into categories where the group starts with a well-known name and a strong balance sheet, and very little else. That shift, more than any single product launch, is the real story here.

Anatomy of the Bold Bet

The group's expansion can be understood as eight simultaneous fronts, each carrying its own capital intensity, competitive

intensity and payback horizon.

infrastructure is expanding to keep pace with that housing

The Eight Fronts of The Aditya Birla Group's Current Expansion		
Growth Platform	Strategic rationale	Key Investor Question
Paints (Birla Opus)	Large, structurally growing housing & repainting market	Can it convert capacity into profitable volume share against Asian Paints?
Jewellery (Indriya)	Formalisation of a ~60% unorganised market	Can it build trust and repeat purchase quickly enough to justify store rollout?
Wires & cables (Ultravolt)	₹90,000-crore market riding urbanisation, electrification, digitisation	Can capacity built on day one convert into a genuine top-two market position?
Cement & building materials	Infrastructure and housing demand cycle	Will additional capacity earn adequate returns as margins compress?
Financial services	Under-penetrated credit, insurance and investment markets	Can scale be achieved without asset-quality or solvency strain?
Fashion & retail	Rising discretionary, branded consumption	Can the post-demerger portfolio produce sustainable margins?
Digital & B2B platforms	Integrated group ecosystem, MSME digitisation	Do these platforms have a standalone viable economic model?
Metals & manufacturing	Global scale, downstream products, technology	Will heavy capex deliver adequate returns through the cycle?

Within roughly two years of commencing operations, Birla Opus brought all six greenfield plants on stream, taking its total installed capacity to 1,332 million litres per annum and entering a decorative paints market long dominated by Asian Paints, with Berger, Kansai Nerolac and the newly entered JSW Paints also defending share. Indriya is attempting to build a branded, trust-driven retail chain in a category, jewellery, where over 60 per cent of India's market is still unorganised, and where Tanishq took roughly three decades to become the branded market leader. Ultravolt enters a wires-and-cables market dominated by Polycab, KEI Industries, Havells and Finolex, but unlike paints or jewellery, this is a B2B, dealer-led category structurally closer to cement. UltraTech's existing network of roughly 4,400 Building Solutions outlets and its relationships with contractors and electricians give it a genuine, if unproven, distribution shortcut that its other new-economy bets do not enjoy. Aditya Birla Capital is chasing scale in lending, asset management and insurance simultaneously, sectors where distribution reach and underwriting discipline matter more than balance-sheet size alone. UltraTech and Grasim continue to add cement and building-materials capacity into a housing and infrastructure cycle that has been more inconsistent than consistently strong over the past five years.

Why Now

Management's own justification for the timing rests on a reasonably well-supported macro thesis. India's per-capita income is rising through a range where discretionary consumption categories, paint repainting cycles, branded jewellery and organised fashion, historically accelerate. Formalisation, aided by GST and tighter compliance, has structurally shifted share from unorganised to organised players across paints, jewellery, wires and building materials over the last decade. Housing starts and government infrastructure spending support cement and building-materials demand, even if the cycle has been lumpier than bulls expected.

For Ultravolt specifically, Birla has pointed to three structural drivers, urbanisation, electrification and digitisation, that he expects to sustain demand well beyond a single capex cycle: over 100 million new homes are projected to be built in India over the next decade, each requiring wiring; power

growth and industrial demand; and the rapid build-out of data centres across India is creating a new, high-value category of cable demand that did not exist at meaningful scale even five years ago. This is a more diversified demand thesis than paints or jewellery can claim, since it draws on housing, industrial capex and digital infrastructure simultaneously rather than a single consumption trend.

And critically, the group's mature businesses generate enough free cash flow, and the group carries enough balance-sheet credibility, to fund multi-year, pre-revenue capacity build-outs without immediately straining the parent's credit profile.

The counter-argument is timing risk: several of these categories, paints and financial services in particular, are being entered by well-capitalised new competitors at the same moment, from JSW Paints' 2024 entry into decorative paints to a crowded field of new-age NBFCs and insurers. A structurally growing pie does not guarantee that a new entrant captures a profitable slice of it; it only guarantees the pie is worth fighting over.

The Capital Behind the Ambition

The financial scorecard across the group's ten listed entities presents a distinctly mixed picture. UltraTech Cement grew revenue at about 14 per cent annually between FY22 and FY26, even as its operating margin narrowed from roughly 23 per cent to 20 per cent. Interest cover also declined from 12.7 times to 9.4 times, reflecting the capital intensity of its continuing capacity expansion. The coverage remains comfortable, but the moderation shows that growth has come with a higher financing burden.

Hindalco Industries presents a somewhat different picture. Revenue compounded at about 9 per cent annually over FY22–FY26, while operating margins moderated from 15.1 per cent to 13.7 per cent. Despite this, interest cover improved from 7.8 times to 10.9 times, indicating a stronger ability to service debt. With Novelis accounting for a substantial part of the group's global operations, Hindalco's scale, cash generation and balance-sheet improvement have helped strengthen its debt-servicing position even as profitability remained exposed to aluminium prices and global industrial conditions.

Cover Story

Market capitalisation across group companies, ~5 years ago versus today

(Source: BSE, company disclosures)

Among the faster-growing businesses, Aditya Birla Capital stands out. Revenue compounded at nearly 20 per cent annually between FY22 and FY26, while profit after tax grew at roughly 22–24 per cent a year, depending on whether reported or adjusted PAT is considered. This still places it among the strongest profit-growth performers in the group. The expansion, however, has been accompanied by a substantial increase in borrowings and interest costs, while reported interest cover declined from around 1.6 times to 1.4 times.

That ratio needs to be interpreted differently from those of manufacturing companies. For a lending business, borrowings and interest expense are integral to operations rather than simply indicators of financial stress. The more relevant question is whether Aditya Birla Capital can continue expanding its loan book while maintaining asset quality, adequate capitalisation and disciplined funding costs. Its numbers therefore point less to conventional balance-sheet strain and more to the increasing importance of credit quality and risk management as the financial-services platform scales.

Aditya Birla Group: Then and Now

Market capitalisation across the group's listed entities (roughly five years ago versus today)

Company	Mkt. Cap. ~5yr. ago (₹ Cr.)	Mkt. Cap. now (₹ Cr.)	Share Price 5-yr. CAGR*
UltraTech Cement	2,05,635	3,30,732	8.6%
Hindalco Industries	1,08,762	2,28,318	16.3%
Grasim Industries	15,340	2,25,272	14.9%
Vodafone Idea	9,959	1,56,881	5.0%
Aditya Birla Capital	24,645	1,04,548	29.5%
Aditya Birla Sun Life AMC	20,150	30,183	8.5%
Aditya Birla Real Estate	10,246	15,370	8.6%
Aditya Birla Fashion and Retail	18,881	6,155	-27.4%
Century Enka	997	1,349	6.3%
Aditya Birla Money	351	721	15.3%

Price CAGR excludes dividends and, for a few names, is affected by demergers or large equity issuance – see main text. Source: BSE, company disclosures.

At the other end, Aditya Birla Fashion and Retail's numbers look weak in isolation, revenue essentially flat over five years and swinging to a net loss, but a large part of that reflects the June 2025 demerger of its higher-margin lifestyle brands (Louis Philippe, Van Heusen, Allen Solly and Peter England) into a separately listed entity, Aditya Birla Lifestyle Brands Limited. Judging ABFRL's standalone numbers without accounting for that structural split would overstate the damage; investors need to track ABLBL's separate performance to get a true read on the fashion portfolio. Similarly, Aditya Birla Real Estate's sharp revenue decline reflects a change in the underlying business mix rather than a straightforward demand collapse, and Vodafone Idea's large reported FY26 profit reflects a one-off deferred-tax and AGR-related accounting adjustment rather than an operating turnaround. All three are flagged in Table 2 rather than treated as comparable growth or decline.

Grasim Industries' own numbers are harder to parse cleanly because its financial statements increasingly reflect the group's evolving holding structure for financial services and paints, a

Five-Year Financial Scorecard Across Listed Group Companies

Company	Sales CAGR FY22–26	OPM FY22 → FY26	PAT CAGR FY22–26	Interest Cover FY22 → FY26	5-Years Price CAGR
UltraTech Cement	13.90%	22.9% → 19.9%	~3.1%	12.7x → 9.4x	~7%
Grasim Industries	16.40%	22.2% → 21.4%	-0.50%	4.4x → 2.5x	~17%
Hindalco Industries	9.00%	15.1% → 13.7%	-1.4%*	7.8x → 10.9x	~17–20%
Aditya Birla Capital	19.6%*	N/A	24.00%	N/A	~29%

Aditya Birla Real Estate	-44.00%	11.8% → 75.4%	n/m	9.3x → 4.8x	~10%

*Not meaningful where the base-year figure was negative or near zero, or where a corporate restructuring distorts the comparison (see notes on Vodafone Idea, ABFRL and Aditya Birla Real Estate below). Source: company disclosures, BSE data as of September 3, 2026. n/m = not meaningful; N/A = should not be used for a like-for-like comparison.

The Group's Major Listed Companies in India

1	Grasim Industries Limited – cement, chemicals, paints & financial-services holding
2	UltraTech Cement Limited – India's largest cement producer; also houses the new Ultravolt wires & cables brand
3	Hindalco Industries Limited – aluminium & copper; owns Novelis globally
4	Aditya Birla Capital Limited – NBFC, asset management, insurance holding
5	Aditya Birla Fashion and Retail Limited – Pantaloons & fashion retail
6	Aditya Birla Lifestyle Brands Limited – demerged June 2025 (Louis Philippe, Van Heusen, Allen Solly, Peter England)
7	Aditya Birla Sun Life AMC Limited – mutual fund management
8	Aditya Birla Money Limited – broking & distribution
9	Aditya Birla Real Estate Limited – real estate & pulp/paper-linked business
10	Century Enka Limited – synthetic yarn & fibre
11	Vodafone Idea Limited – telecom; a promoter partnership with Vodafone Group, not wholly owned

Note: unlisted operating businesses and brands – including Novelis, Birla Opus, Indriya, TMRW and Birla Carbon – sit within these listed entities or as separate unlisted subsidiaries.

reminder that in a conglomerate this complex, headline consolidated numbers at the holding-company level can overstate or understate any single business line, and cross-checking segment disclosures matters more than usual here.

The Birla Method of Market Entry

Across every new business, paints, jewellery and financial services, the same six-step playbook is visible:

- Enter a category with a large, structurally growing addressable market.
- Commit capital before meaningful revenue exists.
- Build manufacturing or distribution capacity at scale rather than testing with a pilot.
- Lean on the Birla name and group relationships for initial trust and access.
- Push distribution aggressively rather than organically.
- Accept multiple years of margin or return pressure while targeting outright category leadership rather than a modest, profitable niche.

This playbook has worked before in industrial categories: cement and aluminium capacity, once built, sell into a structurally growing market with relatively simple, standardised buying decisions. It is a materially harder playbook in consumer categories, where trust, brand aspiration and service experience are built person by person, transaction by transaction, and where capacity alone cannot manufacture a customer relationship. The Birla method has never really been tested against that constraint at this scale before, and that, more than the industry-specific competitive dynamics, is the real experiment underway.

The Competitive Battle

Every category the group has entered already has an entrenched, well-resourced incumbent unlikely to cede share without a fight. Asian Paints, with a market share north of 50 per cent in decorative paints, has already responded to Birla

Opus and JSW Paints with sharper dealer schemes and pricing actions that compressed its own margins, a sign that new entrants are extracting share, but at an industry-wide profitability cost, not necessarily a profitable one for themselves yet. Tanishq's three-decade head start in organised jewellery, backed by Tata Group trust, will not be closed by store count alone; customer acquisition in jewellery runs through repeat purchases and generational trust that are expensive and slow to build. In lending and insurance, Aditya Birla Capital competes against both legacy private banks and a wave of well-funded new-age NBFCs and insurance technology companies, all bidding up customer-acquisition costs simultaneously.

The wires-and-cables market reacted to UltraTech's intent to enter well before Ultravolt was even a brand name: when the board approval was first announced in February 2025, shares of Polycab, KEI Industries, RR Kabel, Havells and Finolex Cables all fell sharply in a single trading session, a rare instance of an incumbent industry pricing in a competitive threat before the new entrant had sold a single metre of cable. That reaction reflects the same dynamic UltraTech exploited in cement and Birla Opus is exploiting in paints: a large, well-capitalised entrant with an existing dealer network can credibly threaten margins even before it ships volume. Whether Ultravolt's launch-day claim to second-largest capacity converts into second-largest market share is the more important, and considerably harder, test still to come.

The common thread is that in every one of these fights, gaining share typically means either accepting lower margins than the incumbent, spending disproportionately on distribution and brand, or both, and the incumbents, sitting on stronger cash generation in their core categories, can typically absorb a prolonged price or promotional war for longer than a new entrant expects.

The Risks Behind the Expansion

Five risks stand out from the data and the strategy itself:

- **Simultaneity:** The group is fighting capital-intensive battles in paints, jewellery, fashion, financial services and digital platforms at once, stretching management bandwidth and diluting the benefit of the group's own scale advantage across any single fight.
- **Payback period:** Paints and jewellery capacity, once built, typically take several years to generate returns on capital that justify the initial outlay, a genuine test of investor patience, not just operational execution.
- **Rising leverage in specific pockets:** Aditya Birla Capital's interest costs and UltraTech's falling interest cover both show the cost of funding growth is rising, even if absolute debt levels remain manageable for now.
- **Cyclicality in the core:** Cement, metals and telecom, the businesses funding much of this expansion, are themselves exposed to commodity cycles, regulatory shifts (as Vodafone Idea's AGR-related history shows starkly) and demand volatility that could squeeze the very cash flows the new bets depend on.

Cover Story

- **Capability transition:** Consumer businesses require genuinely different organisational instincts, merchandising, brand marketing and retail experience, than the engineering- and operations-led culture that built the group's industrial businesses, and that cultural shift cannot be bought with capital alone.

Kumar Mangalam Birla's Leadership Test

Birla's own record shows a chairman who has become progressively more comfortable with large, long-gestation bets over his three decades in charge. The Novelis acquisition in 2007 remains the clearest precedent, a deal that looked overpriced and over-leveraged for years before proving out. What is different this time is the number of simultaneous bets and their category diversity: Novelis was a single large industrial acquisition inside a business Hindalco already understood; the current expansion spans half a dozen categories the group has never operated in.

Birla has also increasingly delegated day-to-day operating control to professional CEOs across group companies while retaining capital-allocation authority himself, a structure that has generally served the group's industrial businesses well but has not yet been tested at this scale in consumer categories, where founder-led or promoter-led rivals (the Tata Group in jewellery and fashion, Asian Paints' promoter legacy) often move with a different rhythm. How the next generation of Birla family leadership eventually engages with this expanded, more consumer-facing portfolio remains an open question that will matter far beyond the next five years. For now, this expansion phase is unambiguously the most diversified and highest-stakes capital-allocation test of his career.

What It Means for Investors

Investors should resist treating 'Aditya Birla Group' as a single investment thesis; the ten listed entities in this analysis have starkly different risk-reward profiles, and lumping them together obscures more than it reveals.

UltraTech Cement and Hindalco remain the group's most self-funding, cash-generative businesses, effectively financing much of the group's ambition through dividends and internal accruals even as their own margins face cyclical pressure. Investors here are underwriting execution risk in the core, not the new bets directly. UltraTech shareholders now carry a second, smaller execution question too: Ultravolt's ₹1,800-crore investment is modest next to UltraTech's own balance sheet, but a genuine push for a top-two position in wires and cables will likely mean years of promotional spending and price competition before it is margin-accretive, a cost worth watching for, even if it is unlikely to move the needle on UltraTech's consolidated numbers for at least two to three years. Aditya Birla Capital offers the closest pure exposure to the group's financial-services ambitions, with the fastest profit growth in this dataset, but also the fastest-rising leverage and the tightest interest cover, a name to watch for asset-quality trends and capital-raising more than most.

Profit trajectory across the group's financial-services entities

(Source: company disclosures)

Aditya Birla Sun Life AMC is a comparatively low-risk, high-margin annuity-like business benefiting from India's structural shift towards financialised savings, and its numbers, a roughly 72 per cent operating margin and consistent profit growth, reflect that. Grasim, now the group's holding vehicle for cement, chemicals and the paints bet, requires investors to look through consolidated numbers to the underlying segments before drawing conclusions. ABFRL and its newly demerged sibling ABLBL need to be tracked as two separate, recently split stories rather than one continuous narrative. Vodafone Idea remains a structurally distinct, government-dependent turnaround story where reported profit numbers can be driven

Six Milestones That Will Determine Whether the Bet Is Working

- 1 Birla Opus's paint volume market share and plant-utilisation rates.
- 2 Indriya's store count and same-store sales growth versus Tanishq.
- 3 Ultravolt's capacity utilisation and actual market-share gains against Polycab, KEI and Havells by FY28.
- 4 Aditya Birla Capital's gross NPA ratio and insurance solvency margin as it scales.
- 5 UltraTech and Grasim's core operating margins – stabilising or still compressing.
- 6 Group-level net debt-to-EBITDA trend across the listed entities funding this expansion.

by one-off accounting items rather than underlying operating improvement, and should be read with particular caution.

On valuation, the market has already re-rated several of these names meaningfully: UltraTech's share price has compounded at roughly 9 per cent a year over five years even as earnings growth slowed, suggesting the market is not obviously underpricing execution risk in the core; Aditya Birla Capital's stock has compounded at nearly 30 per cent a year, arguably pricing in a good deal of the financial-services growth story already. For context, the Nifty 50 has compounded at roughly 9–11 per cent a year in price terms over the same trailing five-year window, so several group names have meaningfully outpaced the broader market, leaving a narrower margin of safety for investors buying today than for those who backed the group's pivot five years ago. That is a reasonable case for new money to wait for clearer operating proof points, such as Birla Opus volume-share data or ABCL's asset-quality trends, rather than buy the growth narrative alone.

Conclusion: Building the Next Birla Group

Kumar Mangalam Birla has already done the hard work of turning an inherited, fragmented industrial group into a set of global-scale, professionally managed businesses. That was proof

that he could allocate capital and integrate operations well. What he is attempting now asks a fundamentally different question: can an industrial conglomerate, built on engineering discipline and manufacturing scale, build genuine consumer franchises, the kind that live on trust, brand and repeat purchase rather than capacity and cost curves?

The financial record so far is neither a vindication nor an indictment. It shows a group with real balance-sheet strength, genuine cash-generating power in its core businesses, and the patience to fund multi-year, pre-revenue bets that few Indian conglomerates could attempt simultaneously. It also shows rising leverage in the businesses carrying the heaviest new-economy ambitions, margin compression in parts of the industrial core that is supposed to be funding this expansion, and at least one high-profile consumer bet, fashion retail, that has required a structural reset rather than organic improvement.

Kumar Mangalam Birla has already transformed the scale and global reach of the group he inherited. His next test is more complex: proving that an industrial conglomerate can build consumer franchises with the same success with which it built factories. The data in this story does not yet answer that question; it only tells you where to look for the answer over the next few years.

Tax Column

Jayesh Dadia
Chartered Accountant

I am an individual. I have donated four swing machines, chairs, tables and other furniture to a registered charitable trust to enable it to carry out vocational activities that support ladies. The total amount I spent is Rs 9 lakh. Can I claim benefit under Section 80G of the Income Tax Act?

It is a good gesture on your part to give a donation worth Rs 9 lakh to a charitable trust for a good cause. However, unfortunately, you may not be entitled to benefit under Section 133 of the Finance Act, 2025 (Section 80G of the Income Tax Act, 1961). The Rs 9 lakh donation you have given is not in cash but in kind. The term 'any sum paid' refers strictly to monetary benefit. Hence, only cash donations qualify for deduction, and donations in kind are not allowable. You should have given Rs 9 lakh by way of cheque to the charitable trust, and with that money, the charitable trust could

have bought machines and furniture. Anyway, in future, please follow the above suggestions.

I am a secretary of a residential co-operative society where I reside. The income of the co-operative society is interest on fixed deposits with banks and receipts from members under various heads. Against this income, the society incurs expenses for maintenance and other administrative expenses and makes a surplus. Whether the surplus is subject to tax or enjoys exemption?

Co-operative societies, although assessed to tax separately and also having a legal identity, act in a beneficiary capacity on behalf of their members. Therefore, societies enjoy the principle of mutuality. Any receipts by the co-operative society from its members, i.e., non-occupancy charges, transfer charges, common amenities charges, maintenance and other charges, are exempt from income tax on the principle of mutuality. The law is settled in view of various judicial pronouncements, including those of the Apex Court. As far as interest income is concerned, the principle of mutuality does not apply to it. Therefore, interest income is taxable in the hands of the society. However, if interest is earned from co-operative banks, then the same is entitled to deduction under Section 149 of the Finance Act, 2025 (Section 80P of the Income Tax Act, 1961). Interest earned on fixed deposits with nationalised banks is subject to tax at normal slab rates.

I am an individual Non-Resident Indian and on deputation to Denmark. As an employee of an Indian company, I rendered services in Denmark and received salary from a Denmark company. However, the entire salary/remuneration was credited to my Indian bank account by the Denmark company. I am worried about where it will be taxed in India.

If it is established that you are a Non-Resident in a particular financial year, then foreign income earned outside India

is not taxable in India. In your case, you have enough evidence that you have rendered services in Denmark by staying there, and on that salary income, you have also paid Denmark local taxes. As such, in my opinion, although the salary was received in India, the same is still in the nature of foreign income and earned outside India. Therefore, it cannot be taxed in India. The Assessing Officer may tax it, but you have a fair chance of succeeding at the appellate stage. Therefore, kindly ensure that, at the assessment stage, you submit all the relevant documents, including the Tax Residency Certificate of Denmark.

My family has a registered charitable trust that owns a small plot of land in Pune. The trust proposes to sell this plot of land and is likely to make substantial capital gain. Can you please suggest what options are available with the trust so that the trust can enjoy exemption on the entire capital gain?

A small plot of land is nothing but a capital asset, and therefore, on its sale, the surplus is nothing but long-term capital gain, which in normal cases is chargeable to tax. However, a charitable trust enjoys special exemption. Section 341(9) of the Finance Act, 2025 permits a charitable non-profitable trust to utilise the entire capital gain for acquiring another capital asset. Then, the surplus capital gain shall be deemed to have been applied for application to the objects of the trust. Interestingly, the new capital asset could be a fixed deposit with banks for a period of five years (CBDT Instructions No. 883 of 1975). As such, if your trust invests the entire capital gain in a fixed deposit, then the capital gain enjoys exemption, as it amounts to application of income for the purpose of the objects of the trust. Subsequently, if the trust wants to invest in another immovable property, then the fixed deposit can be encashed, and the entire amount realised can be utilised for the purchase of another immovable property. Therefore, the Act has given enough options for utilisation of the surplus amount on the sale of a capital asset.

We would be happy to address your tax-related queries. Kindly share them with us at editorial@dsij.in

TOLL TALE ON THE RISE

IRB Infrastructure
BSE Code: 532947
CMP: ₹19.20

India's highway story has a steady compounder running quietly through it. IRB Infrastructure posted a 51 per cent jump in net profit in Q1 FY27, while August 2026 toll revenue extended the momentum with a 25 per cent year-on-year rise, driven by sustained traffic growth and FY27 tariff revisions. New assets are adding to the revenue base, with the Ganga Expressway and TOT18 on NH-16 both commencing tolling during the quarter. The company also declared an interim dividend, a quiet signal of confidence in its cash generation. With 28 revenue-generating assets across 13 Indian states, a residual concession life of around 21 years, and a roadmap to grow its portfolio to ₹1,40,000 crore by 2030, IRB is not just collecting tolls; it is building a long-duration infrastructure compounding machine. Monthly toll numbers and InvIT monetisation progress remain the monitorables ahead.

PIPING A NEW REVENUE STREAM

Dilip Buildcon
BSE Code: 540047
CMP: ₹398

Dilip Buildcon has quietly added a new dimension to its story. The company received a Letter of

Intent from the Petroleum and Natural Gas Regulatory Board to develop an LPG pipeline from Paradip in Odisha to Raipur in Chhattisgarh, valued at approximately ₹1,800 crore. Beyond construction, Dilip Buildcon will operate the pipeline for 25 years through a special purpose vehicle, shifting from a pure EPC contractor to a long-duration infrastructure operator. Whether the formal work order is concluded smoothly will determine how quickly this new chapter reflects in the financials.

BLASTING INTO AFRICA

Solar Industries
BSE Code: 532725
CMP: ₹19,250

Solar Industries just made its boldest move yet. The Nagpur-based explosives giant has signed a definitive agreement to acquire South Africa's Omnia Holdings for ₹12,951 crore in an all-cash deal. Omnia operates across 23 countries with over 70 distribution centres and reported FY26 revenue of approximately ₹13,307 crore. The deal expands Solar's global footprint while opening entry into Africa's crop nutrition and agricultural biologicals market, well beyond its core explosives business. Back home, Q1 FY27 net profit surged 93 per cent year-on-year to ₹653 crore. With defence business expansion already underway and now a continental-scale acquisition in play, Solar is building a platform that looks considerably different from what it was just a few years ago. Regulatory approvals across multiple African jurisdictions remain the key monitorable.

SCANNING A BIGGER MAP

Vijaya Diagnostic Centre
BSE Code: 543350
CMP: ₹1,496.35

Vijaya Diagnostic Centre is quietly expanding beyond its South Indian stronghold. On September 11, 2026, the company completed a 100 per cent acquisition of Arya Wellness Centre in Guwahati, marking its first step into the Northeast. The financials add conviction; Q1 FY27 revenue rose 23 per cent year-on-year, while net profit jumped 38 per cent. The diagnostics sector is consolidating rapidly, and branded players are steadily winning share from standalone laboratories. Whether the Northeast becomes a meaningful contributor will depend on how quickly Vijaya scales its Guwahati platform.

Staying Invested Through Volatility

Indian mutual fund investors are navigating a challenging combination of rising global bond yields, geopolitical uncertainty and elevated crude oil prices. With the US 10-year Treasury yield flirting around 5 per cent and crude oil moving above USD 100 per barrel, this is putting pressure on emerging markets such as India.

For long-term mutual fund investors, however, such periods are better viewed as part of the market cycle rather than a reason to abandon equity exposure.

A major source of resilience in our market today is the growing participation of domestic investors. SIP contributions have grown at an estimated CAGR of 26 per cent over the past decade and recently touched around Rs 32,200 crore a month. Overall purchases have also remained strong beyond regular SIP flows, indicating that some investors are deploying additional money during market weakness. Investor interest has remained visible in the NFO market too, with 17 new fund offers adding to activity.

History also offers an important perspective. In periods when equities, as measured by the BSE 500, recorded negative returns for a financial year, the following two years generated an average double-digit return based on the historical data considered since FY07. Even the weakest outcome was around 10 per cent.

For investors with a five-year horizon, historical observations also suggest that the probability of equity returns failing to exceed the 7 to 8 per cent range associated with debt has been relatively low. This does not guarantee similar future returns. It does, however, reinforce the importance of time in equity investing.

Rather than stopping SIPs or trying to identify the exact market bottom, investors can focus on asset allocation, diversification and disciplined investing. Those with surplus funds and sufficient risk appetite may consider staggered additional investments during corrections.

Volatility can test conviction, but long-term wealth creation through mutual funds ultimately depends less on predicting markets and more on staying consistent through different market cycles.

Executive Editor

Build a Portfolio That Fits You

I really liked your story on understanding your investor personality. Thank you for helping me realise that, considering my family responsibilities, I am actually an 'income seeker' kind of investor. However, I had been behaving more like a 'momentum chaser' because I was in a hurry to make quick profits. What should I do now?

- Shyam Upadhyay

Editor Responds : Thank you for your kind words. Now that you have identified yourself as an income-seeking investor, the next step is to align your portfolio with your financial goals and responsibilities. Start by reviewing your existing investments and ask yourself why you bought each one. Identify investments that were chosen mainly for quick gains or momentum rather than your financial needs. Gradually shift your focus towards investments that can provide a suitable balance of income, stability and long-term growth. At the same time, maintain adequate emergency savings and avoid taking excessive risks simply to generate higher returns. Most importantly, give yourself time and avoid making investment decisions driven by market excitement or fear.

The Focused Fund Puzzle

Focused funds have grown on the promise of sharper portfolios and stronger conviction. But does owning fewer stocks truly translate into better returns? We analyse the category's biggest winners, underperformers and the factors that separate genuine fund management skill from market luck

When Conviction Meets Chaos

In September 2025, an investor we shall call Supriya — a 34-year-old product manager in Gurugram — split a lump sum bonus between two funds from the same "focused equity" category. One went into Motilal Oswal Focused Fund, a high-conviction, high-turnover portfolio built around thirty ideas. The other went into Franklin India Focused Equity Fund, one of the category's oldest and largest offerings. Both funds sat under the identical SEBI label. Both promised the same thing: fewer stocks, deeper research, sharper returns.

Eleven months later, in August 2026, Priya's statements told two entirely different stories. Motilal Oswal's fund had returned 29 per cent over the trailing year — the best performance in the entire category. Franklin India's fund had lost investors money, down 6.2 per cent over the same period, the worst showing among all 28 funds in the space. Same regulatory category, same 30-stock ceiling, same "very high

risk" label on the riskometer — and a 35-percentage-point gap in outcomes. That gap is not a footnote. It is the entire story of focused funds in India.

The past year has been a useful stress test for the format. Indian equities delivered one of the more unsettled stretches in recent memory: a savage technology sell-off in February 2026 that some analysts likened to a mini AI-bubble unwind, followed by a broad-based March rout in which large-cap funds shed close to 12 per cent, mid-caps nearly 11 per cent and small-caps almost 10 per cent in a single month.

By July, the average flexi-cap fund had round-tripped back to where it started the year, and large-caps were still nursing losses. Against that backdrop, the focused category — collectively holding roughly ₹1.86 lakh crore across 28 direct-plan schemes as of August 2026 — has produced a median one-year return of just under 5 per cent, but with a

dispersion between best and worst performer wide enough to swallow an entire market cycle.

This is the paradox at the heart of the focused-fund proposition. The category exists on a simple, seductive premise: give a skilled manager fewer names to worry about, let conviction replace diversification, and superior stock-picking should translate into superior returns. In theory, concentration is a lever for alpha. In practice, in a market as volatility-prone as India's, that same lever amplifies manager error just as efficiently as it amplifies manager skill. Priya's two funds are proof that the category label tells you almost nothing about which side of that lever you will end up on.

So is the focused-fund format actually suited to India's swings, or is it a structure that works brilliantly for a handful of managers and punishes everyone else who merely bought the story? Answering that requires digging into the numbers — returns, risk, cost, manager tenure and the messy question of skill versus luck — rather than the marketing pitch.

From Regulatory Afterthought to Investor Favourite

Focused funds did not always have a name of their own. Before October 2017, when the Securities and Exchange Board of India rolled out its landmark mutual fund re-categorisation exercise, concentrated equity portfolios existed as a stylistic choice within diversified schemes rather than a distinct product category. SEBI's 2017 framework changed that by carving out "Focused Fund" as one of eleven equity sub-categories, defined by a single, elegant constraint: a maximum of 30 stocks in the portfolio. Everything else — which market-cap segments to hunt in, how much to churn the book, which sectors to overweight — was left to the fund manager's discretion, subject to a minimum equity allocation that regulators have since tightened from an original 65 per cent to 80 per cent under the current categorisation norms.

That single design choice — cap the number of names, but don't cap where those names come from — is what makes focused funds structurally different from their closest regulatory cousins, summarised below.

Category	Max. Stock Count	Market-Cap Allocation Rule	Min. Equity
Focused Fund	Max. 30 stocks	No mandated split — manager discretion	80%
Multi-Cap Fund	No cap (typically 50-100+)	Min. 25% each in large-, mid-, small-cap	75%
Flexi-Cap Fund	No cap (typically 50+)	No mandated split — manager discretion	65%
Large-Cap Fund	No cap	Min. 80% in top-100 large-cap stocks	80%

For years after 2017, the category remained a niche corner of the industry, dwarfed by large-cap and multi-cap offerings. That began changing meaningfully from around 2020, as a wave of new launches — Mirae Asset, Kotak, HSBC, ITI, and,

most recently, Old Bridge Mutual Fund's high-profile entry helmed by veteran value investor Kenneth Andrade — expanded investor choice and, more importantly, marketing visibility. Distributors found focused funds an easy story to sell: "your fund manager's 30 best ideas" is a more compelling pitch than "a diversified basket you could largely replicate with an index fund." The result has been a decade of steady asset accumulation, and — as the data below shows — a category that has kept growing even through a year in which its own median return barely beat inflation.

The Numbers: A Category of Extremes

Returns and The Dispersion Problem

Pull the trailing performance data on all 28 direct-plan focused funds as of early September 2026, and the headline is not the category average — it is the spread around it. The category snapshot below sets the scene.

Number of funds in category	28 direct-plan schemes
Total category AUM	₹1,85,980 crore (as of Aug 2026)
Median 1-Year return	4.85%
Median 5-Year SIP return	12.2% p.a.
Average expense ratio (direct)	0.72%
Average Sharpe ratio	0.59

The median one-year return sits at 4.85 per cent, roughly in line with what large-cap and flexi-cap categories have managed through a choppy 2026, but the range around that median is extraordinary for what is nominally a single, homogenous category, as the chart below makes plain.

Chart 1: One-year trailing returns across all 28 direct-plan focused funds. The near-35-point spread between Motilal Oswal (+29.0%) and Franklin India (-6.2%) illustrates how differently managers have used the same 30-stock mandate. Source: Value Research, consolidated 08-Sep-2026.

At one end: Motilal Oswal Focused Fund at 29.0 per cent, Old Bridge Focused Fund (barely two-and-a-half years old) at 19.4 per cent. At the other: Franklin India Focused Equity Fund at minus 6.2 per cent, Mirae Asset Focused Fund at minus 1.0 per cent. It is, however, entirely consistent with what concentration theory would predict: fewer stocks means each position matters more, so a manager who gets three or four calls badly wrong has nowhere to hide.

Stretch the horizon out and the picture moderates, as it should — skill and luck separate more cleanly over longer periods. On five-year SIP returns (a more realistic proxy for how most Indian retail investors actually build positions), the category's median comes in at 12.2 per cent annualised, with Invesco India Focused Fund leading at 18.2 per cent, followed by ICICI Prudential Focused Fund at 15.7 per cent, HDFC Focused Fund at 15.5 per cent, Motilal Oswal at 15.1 per cent and SBI Focused at 15.0 per cent. Several of the one-year laggards — Franklin India among them — also languish near the bottom on the five-year SIP table, at under 8 per cent, suggesting their underperformance is not simply a rough patch but a more structural pattern of trailing the pack across periods.

Rank	By 1-Year Return	By 5-Year SIP	By Sharpe	By Alpha
1	Motilal Oswal (29.01%)	Invesco India (18.2%)	Invesco India (0.97)	Invesco India (9.95)
2	Old Bridge (19.44%)	ICICI Prudential (15.71%)	HDFC (0.88)	ITI (6.78)
3	ITI (14.31%)	HDFC (15.50%)	ITI (0.85)	ICICI Prudential (6.05)
4	SBI (13.87%)	Motilal Oswal (15.07%)	ICICI Prudential (0.84)	HDFC (5.74)
5	Quant (12.77%)	SBI (15.03%)	SBI (0.80)	SBI (5.40)

Table: Category leaders across four performance and risk-adjusted lenses. Note how Invesco India and SBI Focused appear in multiple columns — a signal of genuine, persistent skill rather than a single lucky year. Source: Value Research direct-plan data, consolidated 08-Sep-2026.

Risk-Adjusted Returns: Where The Real Separation Happens

Raw returns flatter momentum; risk-adjusted metrics are less forgiving, and they matter more in a category explicitly built to take on extra concentration risk. The Sharpe ratio — which measures return earned per unit of volatility, with higher being better — averages 0.59 across the category's data-eligible funds, a middling figure that masks a genuine quality gradient.

Not Every Winner Is Built the Same

A strong one-year return can often hide the risks taken to achieve it. In focused funds, where a few stock calls can significantly impact performance, the quality of returns matters as much as the returns themselves. Investors should look beyond short-term rankings and assess consistency, risk-adjusted performance and the fund manager's ability to deliver across different market cycles.

The Ten Best Risk-Adjusted Performers in the Category

Chart 2: The ten funds delivering the most return per unit of risk taken. Invesco India's 0.97 Sharpe ratio is nearly 65 per cent above the category average of 0.59. Source: Value Research, consolidated 08-Sep-2026.

Invesco India Focused Fund tops the table with a Sharpe of 0.97, comfortably ahead of HDFC Focused Fund (0.88), ITI Focused Fund (0.85), ICICI Prudential Focused Fund (0.84) and SBI Focused Fund (0.80).

Alpha, the excess returns a fund generates over what its risk profile alone would predict, tells a similar story. Invesco India Focused Fund again leads with an alpha of 9.95, trailed by ITI Focused (6.78), ICICI Prudential Focused (6.05), HDFC Focused (5.74) and SBI Focused (5.40). Several funds, including Franklin India Focused (–1.20), Mirae Asset Focused (–2.46) and Baroda BNP Paribas Focused (–1.12), show negative alpha — meaning they have, on a risk-adjusted basis, actually destroyed value relative to what a passive exposure with similar risk characteristics would have delivered. That is a damning number for a category whose entire raison d'être is manager-driven outperformance.

The chart below plots every fund with a full five-year track record on both axes at once — volatility (standard deviation) against five-year SIP return, with bubble size representing assets under management. The upper-left quadrant is where investors want their fund to sit: high return, low volatility.

The Risk Behind the Reward

Returns alone do not tell the complete story of a focused fund. With portfolios concentrated in fewer stocks, every investment decision carries a greater impact on overall performance.

Funds that generate returns while managing volatility effectively have a stronger foundation for long-term wealth creation. Metrics such as Sharpe ratio and alpha help investors distinguish genuine fund management skill from returns driven by market momentum or favourable conditions.

Chart 3: Risk vs. reward across the category. HDFC and SBI (large bubbles, upper-left) combine scale, calm and strong five-year SIP returns. Franklin India and Mirae Asset (lower-left) have taken below-average risk but delivered below-average reward — the least attractive combination on the chart. Source: Value Research, consolidated 08-Sep-2026.

Downside protection and drawdowns are the other side of the risk coin, and here the case for focused funds is more nuanced than either promoters or critics tend to admit. Because these funds are not mandated to hold any minimum allocation to mid- or small-caps, several managers — HDFC Focused and ICICI Prudential Focused among them — have historically used that flexibility to raise large-cap weightings and cash levels when valuations looked stretched, cushioning portfolios during the sharper legs of the February–March 2026 correction. Other funds, particularly newer, higher-turnover entrants such as Quant Focused (portfolio turnover of 463 per cent — meaning the fund effectively churns its entire book more than four times a year) and Motilal Oswal Focused (turnover of 65 per cent, standard deviation of 19.6, the highest in the category), leaned into momentum and paid for it in volatility, even when the underlying returns look attractive in hindsight. The lesson: "focused" is not a single risk profile. It is a spectrum from disciplined, valuation-aware concentration to high-turnover, high-beta stock-picking that happens to share a regulatory label.

Portfolio Construction: How Managers Actually Use The 30-Stock Leash

The 30-stock ceiling is a constraint on breadth, not on style, and India's focused-fund managers have used that latitude in markedly different ways. Some run what are effectively large-cap-tilted "best ideas" portfolios — SBI Focused Fund, the category's largest at ₹50,041 crore, is managed by Rama Iyer Srinivasan, who has run the fund continuously for close to fourteen years, longer than any other manager in the category, and has built a book that leans heavily on established, liquid large-cap names with occasional mid-cap additions. Others run

genuinely multi-cap focused books that swing hard into mid- and small-caps when conviction is high; Motilal Oswal Focused and Old Bridge Focused, the latter helmed by the well-known value investor Kenneth Andrade, both sit in the "Blend" style box with meaningfully higher turnover and volatility than the SBI or HDFC funds.

Sector concentration compounds the stock concentration. Because a 30-stock cap naturally limits how many sectors a fund can meaningfully represent, focused funds tend to carry larger active sector bets than diversified peers — a heavy private-bank weighting here, an outsized capital-goods or IT bet there. That is precisely the mechanism through which concentration risk shows up in performance: a focused fund that got financials right and technology wrong in 2026's sell-off would have looked very different from one that made the opposite calls, even though both operated within identical regulatory bounds.

The Cost Of Conviction

Expense ratios in the focused category average 0.72 per cent for direct plans — broadly comparable to flexi-cap and large-cap peers, and meaningfully cheaper than the small-cap and thematic categories, but still a real drag when compounded over a decade.

Rank	Lowest Expense Ratio	Largest AUM
1	Canara Robeco (0.48%)	SBI Focused (₹50,041 Cr.)
2	Invesco India (0.49%)	HDFC Focused (₹27,925 Cr.)
3	Kotak (0.51%)	ICICI Prudential (₹17,764 Cr.)
4	Mahindra Manulife (0.52%)	Franklin India (₹11,510 Cr.)
5	Baroda BNP Paribas (0.54%)	Axis Focused (₹11,315 Cr.)

Table: The cheapest and the largest. Note that Invesco India Focused Fund — the category's Sharpe and alpha leader — also sits among the five cheapest funds; proof that low cost and high skill are not mutually exclusive. Source: Value Research, consolidated 08-Sep-2026.

It is worth noting that Invesco India Focused Fund manages the rare trick of combining a low expense ratio with the category's best Sharpe ratio and alpha — evidence that low cost and high skill are not mutually exclusive, even if they are not guaranteed to travel together. Over a ten-year SIP, the difference between a 0.48 per cent and a 1.10 per cent expense ratio can shave off a percentage point or more of annualised return — a gap that, compounded, is larger than many investors realise until they run the maths.

Skill, Persistence and The Honest Answer on "Manager Alpha"

The uncomfortable truth the data surfaces is that outperformance in this category is concentrated in a small number of funds, and it persists reasonably well across time horizons for some of them — but not for others. Invesco India Focused Fund, HDFC Focused Fund, ICICI Prudential Focused Fund and SBI Focused Fund appear near the top of

the table across one-year, five-year and risk-adjusted metrics simultaneously, a pattern that is difficult to explain purely by luck and that most analysts would read as genuine, persistent stock-selection skill compounded by long manager tenures — SBI's Srinivasan (13.7 years), Invesco's Taher Badshah (6 years) and HDFC's team all fall on the more experienced end of the spectrum.

Tax Efficiency and Investor Fit

On taxation, focused funds carry no special advantage or disadvantage relative to any other diversified equity category: short-term capital gains (holdings under twelve months) are taxed at 20 per cent, and long-term gains above the ₹1.25 lakh annual exemption are taxed at 12.5 per cent, identical to flexi-cap, multi-cap and large-cap funds. The tax conversation, in other words, should not drive the choice between focused and diversified equity funds — the risk-return trade-off should.

What Happens Next: Three Paths for the Category

The category's near-term fortunes will hinge on three broad macro forces, each of which points toward a different scenario for focused-fund investors over the next two to three years. Money continues to arrive regardless of the debate: the category has logged a net inflow every single month over the past eleven, even through the February–March 2026 correction.

Chart 4: Category AUM has climbed from ₹1.63 lakh crore to ₹1.85 lakh crore since September 2025, with positive net flows in every single month — including the volatile Feb–Mar 2026 stretch. Source: AMFI, consolidated 08-Sep-2026.

In a continued range-bound or choppy market — the most likely near-term scenario given persistent uncertainty around global rate paths, AI-sector valuations, and India's own election and fiscal calendar — the dispersion story is likely to intensify rather than fade. Range-bound markets punish momentum-chasing, high-turnover managers and reward patient, valuation-disciplined stock-pickers, which should widen the gap between the category's top and bottom quartiles even further. Investors should expect the current leaders — funds combining reasonable turnover, experienced

management and demonstrated risk-adjusted outperformance — to keep separating from the pack, while newer, unproven entrants remain a coin toss.

In a sustained bull run, likely triggered by a durable global rate-cutting cycle, resilient domestic earnings growth, or a re-rating of mid- and small-caps, high-beta focused funds with aggressive mid-cap tilts — the Motilal Oswal and Quant Focused style of portfolio — would be expected to outperform meaningfully, much as they did in the year to September 2026. The risk for investors is recency bias: chasing last year's 29 per cent winner into a fresh bull phase, without appreciating that the same high standard deviation that generated those returns can just as easily generate the next leg of losses when the cycle turns.

In a sharper bear market, of the kind India experienced briefly in February–March 2026, focused funds as a category are structurally more vulnerable than diversified flexi-cap or large-cap peers, precisely because a 30-stock portfolio has less room to average out sector-specific shocks. Funds with lower standard deviation, higher large-cap tilts and managers who have historically raised cash or defensive positioning ahead of drawdowns — the HDFC and SBI style of focused investing — are the more sensible hiding place within the category; high-turnover, high-beta funds are the ones to trim first.

Chart 5: The focused category's one-year average return (5.91%) sat almost in line with flexi-cap funds and well ahead of large- and small-caps in the most recent comparable industry snapshot — evidence that concentration, on average, has not meaningfully hurt category returns even if it has widened the range around them. Source: Business Standard / PL Wealth, illustrative industry snapshot, Jan 2026.

The Bottom Line for Investors

Focused funds are not a verdict on Indian market volatility so much as a mirror held up to it: they take whatever the market gives — opportunity or chaos — and magnify it through the lens of a concentrated portfolio. The category-level data is unambiguous on one point: this is not a format where you can safely buy "the category" and expect category-average outcomes, because the dispersion between funds sharing an

LIC MF Focused Equity Fund	173	1.12	3.11	9.39	15.57	0.36	-0.96	Mahesh Bendre (0.4)

identical regulatory label is simply too wide, and the drivers of that dispersion — manager tenure, turnover discipline, valuation sensitivity — are identifiable in advance, not just visible in hindsight.

For investors weighing an allocation, three practical rules emerge from the numbers. First, treat focused funds as a satellite holding, not a core one — cap the allocation at 10–20 per cent of total equity exposure and keep a diversified flexi-cap, large-cap or index fund as the foundation. Second, screen on process, not just on trailing one-year returns: prioritise funds with below-category expense ratios, above-category five-year Sharpe ratios and alpha, and manager tenures of at least three to five years, since the data shows these traits cluster together and persist. Third, watch turnover as a

red flag rather than a curiosity — a fund churning its portfolio several times a year is making a fundamentally different, higher-risk bet than one holding its convictions for the long haul, regardless of what the marketing brochure says. Red flags worth walking away from include recent, unexplained manager transitions, persistently negative alpha across multiple periods, and standard deviation meaningfully above the category average without a commensurate return premium.

Used selectively, and sized sensibly, focused funds can be a legitimate way to access genuine active-management skill in a market that has, in recent years, made that skill harder to find and easier to mistake for luck. Used carelessly — chased on the strength of last year’s chart-topper — they are simply a faster way to experience India’s market volatility, undiluted.

Reason for recommendation

ITI Focused Fund is a focused equity mutual fund that follows a concentrated investment strategy, investing in a limited number of high-conviction stocks across sectors. Such a strategy can potentially enhance returns when investment calls work in favour of the fund, but it also increases concentration risk. The scheme is therefore more suitable for investors with a long-term investment horizon and the ability to withstand equity market volatility. The fund has delivered strong performance across several investment periods, particularly over the medium to long term. Over three months, it generated a return of 6.92 per cent, broadly in line with the category average of 6.97 per cent. The performance improved over longer periods, with the fund delivering 11.77 per cent over six months against the category average of 8.20 per cent. The one-year return stood at 12.69 per cent, substantially higher than the category average of 2.78 per cent. Over two years, the fund generated 7.57 per cent compared with the category average of 1.24 per cent, while the three-year return of 18.34 per cent also remained ahead of the category average of 11.38 per cent. On the risk front, the fund has a standard deviation of 16.31 and a beta of 1.03, indicating volatility broadly in line with, but slightly higher than, the market. Its Sharpe ratio of 0.85 and Sortino ratio of 1.03 indicate reasonable risk-adjusted performance. The portfolio has its

Top Holdings

Special Investment Funds Open Up Sophisticated Strategies to Retail Investors

Abhimanyu Sharma

Founder,
Swarn Wealth Private Limited

Sophisticated investment strategies such as long-short investing and derivative-based hedging have traditionally been associated with PMS and AIF structures, which come with high minimum investment requirements. For most retail investors, such strategies have remained difficult to access. PMS and AIF structures typically require minimum investments ranging from Rs 50 lakh to Rs 1 crore, sums that exclude a vast majority of investors. As a result, many individuals remain confined to conventional long-only mutual funds.

A new category of investment vehicle seeks to narrow this divide. Special Investment Funds (SIFs), recently introduced within India's asset management ecosystem, aim to bridge the gap between traditional mutual funds and more sophisticated structures such as PMS and AIFs. SIFs require a minimum investment of Rs 10 lakh. That threshold remains substantial but is far lower than the entry levels of PMS and standard AIF structures.

They allow fund managers greater freedom to deploy derivative strategies, including limited unhedged short positions that can benefit from falling markets. In essence, SIFs attempt to make strategies traditionally associated with more sophisticated investment structures available within a more accessible framework.

At the heart of many SIF strategies lies the long-short approach. Rather than relying solely on rising markets, managers combine long positions in companies expected to outperform with short positions in stocks expected to underperform. By blending equity exposure with derivatives and selective hedging, such funds aim to construct portfolios less dependent on broad market direction.

Derivatives play a central role in this strategy; they provide fund managers with the flexibility to express both bullish and bearish views while managing risk. Managers may deploy different instruments either individually or in combination, depending on market conditions and investment outlook. These tools are

particularly useful when markets move sideways, a common but frustrating phase for investors. During such periods, fund managers may write call options on shares already held in the portfolio. This generates option-premium income that can reduce the effective cost of holding the underlying shares. If the stock subsequently breaks out of its trading range, the lower cost base enhances potential gains.

Managers may also employ other derivative techniques. Arbitrage strategies exploit pricing differences between cash market and futures contracts. Protective put options can hedge portfolios against sudden declines. More sophisticated strategies, such as short straddles, which involve selling both call and put options at the same strike price, or short strangles, which involve selling options at different strike prices, can also be used when markets appear likely to remain range-bound. These approaches, however, carry considerable risk if volatility surges and therefore demand careful judgement.

The expansion of derivative-based strategies has also drawn attention to a broader universe of stocks beyond the largest companies. In particular, interest is growing in shares outside the top 100 by market capitalisation. Stocks beyond the top 100 companies now account for roughly 32 per cent of total futures open interest and about 37 per cent of activity in the options market. Many of these firms belong to the small- and mid-capitalisation segments, where improving institutional participation has gradually strengthened liquidity and price discovery. Collectively, such companies now represent close to 39 per cent of India's total market capitalisation.

Historically, small- and mid-cap stocks have delivered impressive gains during bull markets but have also experienced sharper declines during downturns. Their volatility has often deterred cautious investors. Yet, the increasing use of long-short strategies within vehicles such as SIFs can manage some aspects of downside and directional risk. By allowing managers to hedge exposures or profit from falling prices, such strategies can potentially deliver more balanced returns across different phases of the market cycle.

In practice, Equity Ex-Top 100 Long-Short SIF strategies allocate at least 65 per cent of their assets to small- and mid-cap equities, with the remainder invested in large-cap stocks, debt instruments, or Infrastructure Investment Trusts (InvITs). Stock selection typically emphasises companies with strong competitive positions, sound balance sheets, and durable earnings potential.

For investors seeking greater flexibility in uncertain markets, SIFs represent a positive development. By combining the accessibility of mutual funds with some of the strategic freedom associated with alternative investment vehicles, they offer a more sophisticated landscape to retail investors.

Here's How to Build a Future-Ready Portfolio

Hemant Rustagi

Chief Executive Officer, Wiseinvest Pvt Ltd.

If you are an investor who is looking to build a large corpus for important long-term goals like children's education and retirement planning, you must have a plan to get there. While making a detailed investment plan may sound a little intimidating, in reality, it's a simple process that requires you to define your goals, assign a time horizon, set a target for each of the goals and choose tax-efficient investment options that allow you to follow your asset allocation.

Defining goals ensures that you remain focused through your defined time horizon. An important aspect of quantifying long-term targets is to take inflation into account. By failing to do so, in all likelihood, you would have a shortfall after the designated period.

The next step should be to ascertain an appropriate asset allocation and select individual investment options to achieve these goals. Here, the time horizon plays a key role. For example, equity has to be the mainstay of the portfolio for long-term goals, as it has the potential to not only outperform other asset classes but also provide a positive real rate of return, that is, returns minus inflation and taxes.

It is heartening to see an ever-increasing number of investors following a goal-based investing strategy. A systematic investment plan (SIP) has emerged as a popular mechanism for investing in equity funds. Although SIP is an efficient method of turning volatility to one's advantage, the key, however, is to stay invested for the entire duration of the pre-decided time horizon. By doing so, you can gain the maximum from the power of compounding.

Unfortunately, some investors, despite showing a great deal of enthusiasm in the beginning, fail to look beyond 3 to 5 years. This kind of tentative approach towards this volatile but potentially best asset class makes it difficult for them to accept not-so-encouraging results in a current market-like situation.

If you want to realise the full potential of what equities have to offer, you must remember that a volatile market provides a great opportunity to benefit from 'averaging'. That's why it is necessary to start investing with a clear time horizon and remain committed to it.

For example, if you begin investing in equity funds through SIP, with an unflinching commitment to continue this process for the next 20 years, you would find it much easier to handle intermittent periods of volatility. On the other hand, a tentative approach would compel you to analyse the situation afresh every year. Invariably, you would end up taking decisions that are driven by emotions and current market moods rather than any logic.

Remember, time diversification, that is, remaining invested over different market cycles, is an important strategy. It helps in mitigating the risk that you may encounter while entering or exiting a particular investment or category at a bad time in the economic cycle. Longer time periods smooth those fluctuations. Simply put, longer time horizons allow you to take on greater risks, with a greater potential to earn better returns, as some of these risks can be reduced by investing across different market environments.

When you invest in equities, either through mutual funds or directly into stocks, you become a part-owner of a business. Therefore, you must think like an entrepreneur and nurture these investments to reap the benefits over time. However, if your time horizon is short, you would have greater liquidity needs and hence the focus has to be on liquidity, with reasonable certainty of safety of capital.

It's quite possible that you may not have the capacity and the temperament to stay invested in a volatile asset class like equity at the start of your investment process. This can change dramatically over time if you invest in a disciplined manner and stay focused on your investment goals.

Amit Premchandani

Senior Vice President - Equity, UTI AMC

“Long-term SIP success depends mostly on three factors: staying invested through bear markets, increasing SIPs during corrections, and investing in the market for the long term.”

How would a prolonged period of global uncertainty, elevated crude oil prices and rupee volatility affect Indian equity markets over the short to medium-term?

Domestic macro conditions have seen volatility, primarily in currency, as the rupee depreciated meaningfully on account of pressure on capital flows. Timely intervention by the RBI through the launch of a special FCNR deposit window and greater-than-expected inflows through this would provide a cushion on the reserve front. This is likely to improve domestic liquidity and provide further impetus to banks to extend credit. It is also likely to dampen currency volatility.

The inflation trajectory has been much lower than expectations in CY25; however, with a sharp increase in commodity prices, we have seen it moving back to normalised levels recently. Of late, global interest rates have moved up on the back of concerns about the sustainability of fiscal deficits in developed countries and possible debt-funded investments in AI infrastructure.

How would you characterise the current phase of the Indian equity market? Do you expect further consolidation, the beginning of a fresh growth cycle, or a shift towards a more selective, stock-specific market?

The market has seen consolidation and time correction over the last two years, and froth in many sectors has gone down significantly. Large-caps have underperformed materially over the last two years, as earnings growth in the mega-caps has been muted compared with mid- and small-caps. Overall earnings trajectory was impacted by low-inflation-led low nominal GDP growth over the last two years. As inflation inches up, we expect revenue growth to inch up, as reflected in Q1 earnings. Our asset allocation model suggests an increase in allocation to equity as an asset class.

What have Q1 results revealed about the earnings cycle? Are there any signs of recovery, broad-based improvement, margin expansion, or continued pressure in certain sectors?

Q1 FY27 earnings growth has been decent across market caps as well as most sectors. As nominal GDP growth moved to double digits, revenue growth inched up. Margin declines were limited despite a sharp increase in commodity prices. Pressure on margins was visible in cement, FMCG and select automobile players on account of a sharp increase in commodity prices.

Sectors such as mid-cap banks, metals, NBFCs and consumer discretionary drove earnings, while OMCs and cement were a drag. The upgrade/downgrade ratio turned positive this quarter, while globally, AI-linked themes faced questions on the return profile of such huge investments. The consumer discretionary sector has started reviving, with improvement in growth across categories.

Do current valuations adequately reflect India's earnings growth potential, or are investors still paying a premium for growth in certain pockets of the market?

The interplay of a robust macroeconomic outlook with limited linkage to global technological changes will play out. At the same time, global geopolitics has added additional vulnerabilities for equity as an asset class. Global earnings growth has been robust, with Korea and Taiwan leading the way. In this backdrop, earnings growth has been muted in India over the last two years.

This was largely on account of AI-led capex providing tailwinds to global memory chip players; unfortunately, India had no direct plays in that supply chain. India's premium has gone down over the last 24 months, as earnings growth slowed on a relative basis. A large part of the listed space is in old-economy sectors, while the new-economy-led listings in India are yet to demonstrate significant earnings power.

What is the one piece of advice you would give to retail investors today that could make the biggest difference to their long-term wealth creation?

In the long-term, equity market returns are linked to underlying earnings growth, but in the short-term, the market could trade at expensive or relatively cheap valuations depending on the underlying macroeconomic environment and the emotions of greed and fear among investors. Equity markets have a tendency to revert to mean valuations, and a SIP is a relatively better approach for long-term wealth creation. On top of that, investors may increase allocation to equity during market corrections. More than 30 years of data analysis suggests that investments in equities at lower valuations have yielded better forward returns. Long-term SIP success depends mostly on three factors: staying invested through bear markets, increasing SIPs during corrections, and investing in the market for the long-term.

Are You Financially Fit?

When asked, “Am I financially fit?”, most people may instinctively look at their annual salary, portfolio size or investment returns. But are these numbers enough to reveal the true state of your finances? This story explores a few simple financial ratios that can help you assess your financial health, identify potential weaknesses and take the right steps today to build a more secure financial future

Your Salary is Only Part of Your Financial Story

Imagine two professionals, both aged 35, both earning ₹1.5 lakh a month and both living in the same city. At first glance, there may be little difference in their financial lives, as both earn the same income and can afford a similar standard of living. Look beneath the surface, however, and the picture changes considerably. The first person saves ₹45,000 every month, maintains an emergency fund covering six months of essential expenses, has adequate insurance and steadily invests in mutual funds and equities.

The second person saves barely ₹10,000, has a home loan, a car loan and outstanding credit card balances, keeps very little money in liquid savings and invests only when something remains after all monthly expenses have been paid. Both earn ₹18 lakh a year. Yet their financial health is nowhere close to being the same. This is an important distinction because personal finance is often reduced to one number: income. A salary hike is celebrated as financial progress, while a large bank balance is interpreted as financial security and a rising investment portfolio is considered proof that everything is going well. These numbers certainly matter, but none of them provides a complete picture of a person's financial position. Investors understand this principle when they analyse

companies. They rarely decide whether a business is financially strong by looking only at its revenue. They examine profitability, debt, cash flows, return ratios, valuations and the quality of the balance sheet before forming an opinion.

Individuals can adopt a similar approach to their own finances by using a handful of simple ratios that reveal how income is being converted into savings, investments, financial security and long-term wealth. Think of these ratios as a personal financial health check. They are not designed to produce a perfect score or suggest that everyone should follow exactly the same numbers. Instead, they can help identify areas that deserve attention before a weakness develops into a serious financial problem. Let us understand these ratios in greater detail.

Savings Ratio: The First Test of Financial Fitness

$$\text{Savings Ratio} = \text{Annual Savings} \div \text{Annual Income} \times 100$$

The first question is perhaps the simplest one: after paying for your lifestyle, how much of your income actually remains available for your future? The savings ratio measures exactly that. Suppose your annual take-home income is ₹18 lakh and you manage to save ₹4.5 lakh during the year. Your savings ratio works out to 25 per cent, which means one-fourth of your income is being retained rather than consumed.

For many households, maintaining a savings ratio of around 20-30 per cent of take-home income can provide a useful foundation for wealth creation, although the appropriate level can vary substantially depending on age, income stability, family responsibilities and financial goals. A young professional with no dependants and modest expenses may be able to save 40 per cent or more, while a household supporting children and parents, paying a home loan and managing education expenses may find a 20 per cent savings rate more realistic.

The important point is to understand where your own number stands and whether it is improving over time. Someone whose savings ratio rises from 12 per cent to 20 per cent over three years is making meaningful progress even if the person has not reached an arbitrary target. There is another aspect that investors should not overlook. Savings and investments are related, but they are not the same thing.

A person may save ₹30,000 every month and keep most of it in a bank account for years. While this may provide liquidity, it may not be enough to build long-term wealth after considering inflation. This is why the next ratio becomes important. Once you know how much you save, you need to understand how much of that money is actually being put to work.

Investment-to-Income Ratio: Is Your Money Building Your Future?

$$\text{Investment-to-Income Ratio} = \frac{\text{Annual Investment}}{\text{Annual Income}} \times 100$$

Saving is the beginning of financial discipline, but investing is what allows that discipline to translate into long-term wealth creation. The investment-to-income ratio measures how much of your income is being directed towards investments. Consider a person earning ₹20 lakh a year who invests ₹5 lakh. The investment-to-income ratio is 25 per cent. For someone with a long investment horizon, directing around 20-30 per cent of income towards long-term investments can be a useful broad benchmark, provided emergency savings and adequate insurance have already been addressed.

However, the ratio should never be viewed in isolation. Imagine two people who both invest 25 per cent of their annual income. One has six months of expenses parked in an emergency fund, no expensive debt and adequate life and health insurance. The other has outstanding credit card debt and barely one month of expenses in liquid savings. Although their investment ratios are identical, their financial positions are very different.

The composition of investments also matters. A person investing 30 per cent of income in a single highly volatile asset is not automatically financially healthier than someone investing 20 per cent through a diversified portfolio suited to their goals and risk profile. The objective is therefore not to maximise the ratio at any cost. It is to create a sustainable

relationship between income, savings, investments and financial obligations.

For a young investor, this ratio can become particularly powerful because time is an important component of wealth creation. Someone who begins investing a meaningful portion of income in their 20s or early 30s may have decades for compounding to work. Waiting until income becomes very high before beginning to invest can result in lost time that cannot easily be recovered through larger contributions later.

Debt-to-Income Ratio: Is Debt Eating Into Your Future Income?

$$\text{Debt-to-Income Ratio} = \frac{\text{Monthly Debt Obligations}}{\text{Monthly Income}} \times 100$$

Debt should not always be viewed as a negative factor, as it can be a useful financial tool when taken responsibly and managed carefully. A home loan can help a family acquire a property that would otherwise take decades to purchase, while an education loan can finance a qualification that increases future earning potential. Borrowing becomes problematic when EMIs begin consuming so much income that there is little room left for saving, investing or dealing with unexpected expenses. The debt-to-income ratio provides a simple way to identify this pressure.

Suppose your monthly take-home income is ₹1.5 lakh and your home loan EMI is ₹35,000, car loan EMI is ₹15,000 and personal loan EMI is ₹10,000. Your total monthly debt obligations are ₹60,000, resulting in a debt-to-income ratio of 40 per cent. A ratio below roughly 30-35 per cent may generally offer greater breathing room, while a ratio approaching or exceeding 40 per cent deserves closer scrutiny, although there is no universal threshold suitable for every household.

Someone with a stable high income and substantial financial assets may be able to manage a higher ratio than someone whose income is irregular or whose household has significant dependants. The more important question is what kind of debt is creating the ratio. A home loan backed by a valuable property is different from high-cost personal loans and revolving credit card balances used to finance consumption. Two households could have the same debt-to-income ratio while having very different levels of financial risk.

Lifestyle inflation can make the problem even harder to notice. Consider someone whose salary increases from ₹1.2 lakh to ₹1.5 lakh a month. Instead of using the additional income to increase savings and investments, the person upgrades the car and takes on a larger EMI. The salary has increased, but financial flexibility may barely have improved. This is why a rising salary does not automatically mean rising financial strength. If every increase in income is followed by a corresponding increase in commitments, the person may

continue to feel financially stretched despite earning substantially more than before.

Debt-to-Assets Ratio: The Debt Hidden Behind Your Wealth

$$\text{Debt-to-Assets Ratio} = \frac{\text{Total Outstanding Debt}}{\text{Total Assets}} \times 100$$

Income tells you about your current earning capacity, while net worth tells you what you have accumulated over time. But even a person with substantial assets may have a fragile balance sheet if most of those assets are financed through debt. The debt-to-assets ratio measures this relationship. Imagine that you own a house worth ₹1.2 crore, investments worth ₹40 lakh, bank deposits worth ₹10 lakh and other assets worth ₹10 lakh. Your total assets amount to ₹1.8 crore. If your total outstanding debt is ₹60 lakh, your debt-to-assets ratio is approximately 33 per cent.

A lower ratio generally indicates a stronger balance sheet, but again, context matters. A ₹50 lakh home loan against a ₹1 crore property is not financially equivalent to ₹50 lakh of high-cost consumer debt with no corresponding asset. For investors, this is a useful reminder that financial progress is ultimately about building net worth, rather than merely increasing income or accumulating assets.

Net worth is calculated by subtracting total liabilities from total assets. Tracking this number once a year can reveal whether your financial foundation is strengthening. If assets are rising faster than liabilities, the direction is encouraging. If debt is growing faster than assets, a closer examination may be necessary even if your salary and investment portfolio are both increasing.

Emergency Fund Ratio: Could You Survive a Financial Shock?

$$\text{Emergency Fund Ratio} = \frac{\text{Liquid Emergency Savings}}{\text{Average Monthly Essential Expenses}}$$

A financial plan is often built around the assumption that everything will continue as expected. Salary will arrive every month, markets will eventually grow, expenses will remain manageable and there will be no major unexpected event. Real life rarely follows such a neat script. A job loss, medical emergency, major repair, family obligation or sudden career break can disrupt even a carefully constructed financial plan. An emergency fund acts as a buffer between such an event and your long-term investments.

Suppose your essential monthly expenses are ₹60,000 and you have ₹3.6 lakh maintained in highly liquid and relatively low-risk avenues specifically for emergencies. Your emergency fund ratio is six months. For many salaried individuals, four to

six months of essential expenses can be a useful starting range. Those with variable income, business income, significant family responsibilities or less predictable employment may prefer a larger cushion.

The calculation should focus on essential expenses rather than every rupee spent during a normal month. If your monthly spending is ₹1 lakh, but ₹25,000 goes towards dining, entertainment and discretionary purchases, your emergency requirement should be based on the expenses you genuinely need to maintain your household. The emergency fund is also not the place to chase high returns. Its purpose is not to outperform an equity index but to remain available when you need it.

Consider what could happen if an investor loses their job during a market correction. Without an emergency fund, they may be forced to sell equity investments when prices are depressed simply to pay rent, EMIs or household bills. Suppose an investor needs ₹3 lakh during a market correction. Investor B has not merely lost money because of the market decline. The lack of liquidity has forced the investor to convert a temporary market loss into a permanent one. A strong emergency fund therefore protects more than your bank account. It protects your ability to remain invested when markets become uncomfortable.

The Hidden Risk of Selling Investments During a Crisis

Particulars	Investor A	Investor B
Emergency fund	₹4 lakh	₹50,000
Equity portfolio	₹20 lakh	₹20 lakh
Market correction	-20%	-20%
Equity value	₹16 lakh	₹16 lakh
Emergency requirement	₹3 lakh	₹3 lakh
Forced equity sale	No	Yes
Portfolio remaining	₹16 lakh	₹13 lakh

Retirement Replacement Ratio: What Happens When the Salary Stops?

$$\text{Retirement Replacement Ratio} = \frac{\text{Estimated Annual Retirement Income Requirement}}{\text{Pre-Retirement Annual Income}} \times 100$$

The final ratio takes the longest view of all because it asks a question that many investors postpone for years: how much income will you need when your regular salary disappears? The retirement replacement ratio estimates the percentage of pre-retirement income that may be required to maintain your desired lifestyle after retirement. Suppose you currently earn ₹24 lakh a year but estimate that you will need ₹15 lakh annually after retirement to maintain your desired lifestyle. Your replacement ratio is 62.5 per cent.

There is no universal ideal number because retirement needs depend on housing, family responsibilities, healthcare costs, lifestyle expectations and other sources of income. Someone

who enters retirement with a fully paid-off home and no dependants may require significantly less than someone who expects to support family members or maintain a high-spending lifestyle. Inflation makes this calculation even more important. A person aged 35 cannot simply decide that ₹1 lakh a month will be sufficient for retirement because that amount may have a dramatically lower purchasing power several decades later.

Today's ₹1 Lakh is Not Tomorrow's ₹1 Lakh	
Years Ahead	Monthly Expense Equivalent
Today	₹1 lakh
10 years	₹1.79 lakh
20 years	₹3.21 lakh
30 years	₹5.74 lakh

An illustration based on 6 per cent annual inflation.

The better approach is to work backwards from the lifestyle you expect, account for inflation, estimate potential retirement income sources and then determine the investment corpus required to bridge the gap. This is also where starting early becomes extremely valuable. A 30-year-old who discovers that retirement savings are inadequate has decades to increase investments, adjust expenses and benefit from compounding. Someone discovering the same problem at 55 has far fewer options and may have to make much more painful adjustments.

Your Annual Financial Health Check

You do not need an elaborate financial model to begin this exercise. Once a year, preferably around the same time, calculate your important ratios using your latest income, expenses, savings, debt, investments and assets. Start with the Savings Ratio to determine how much of your income you are retaining. Then calculate the Investment-to-Income Ratio to understand how much of that retained money is being directed towards long-term wealth creation. Next, examine the Debt-to-Income Ratio to determine whether monthly commitments are restricting your financial flexibility. Calculate the Emergency Fund Ratio to see whether you could manage an unexpected income disruption without disturbing long-term investments. Your Debt-to-Assets Ratio will then provide a balance-sheet perspective, while the Retirement Replacement Ratio will help determine whether today's financial decisions are sufficient to support tomorrow's lifestyle.

Financial Health Matrix		
Financial Dimension	Ratio	What It Tells You
Cash Flow Strength	Savings Ratio	How much income survives consumption
Wealth Creation	Investment-to-Income	How much income is working for the future
Financial Pressure	Debt-to-Income	How much future income is already committed
Balance Sheet	Debt-to-Assets	How leveraged your wealth is
Liquidity	Emergency Fund	How long you can survive without income
Future Readiness	Retirement Replacement	Whether today's lifestyle is sustainable later

The most useful part of the exercise, however, is not comparing yourself with someone else. Compare your numbers with your own previous year's numbers. If your savings ratio has increased from 15 per cent to 22 per cent, that is progress.

If your debt-to-income ratio has fallen from 45 per cent to 32 per cent, that is progress. If your emergency fund has grown from two months of expenses to six months, that is progress. If your investments have increased while your liabilities have declined, your balance sheet is becoming stronger.

On the other hand, if your salary has increased by 20 per cent but your debt has increased by 40 per cent, the higher income may be hiding a growing vulnerability. If your investment portfolio has grown but you have no emergency fund, your apparent wealth may not provide as much financial security as it seems. Hence, these ratios should not be viewed in isolation. Considering them together provides a more comprehensive picture of your overall financial health.

The True Definition of Financial Fitness

Imagine repeating this exercise consistently over the next five years and tracking how your financial health evolves. Your income rises gradually, but instead of allowing every salary increase to disappear into lifestyle upgrades, you increase your savings and investments.

High-cost debt is eliminated, the emergency fund becomes stronger and the home loan gradually declines. At the same time, your financial assets continue to compound and your retirement corpus moves closer to the target.

There may be no dramatic moment when you suddenly become financially secure. There may be no single investment that transforms your financial life overnight. Instead, the improvement happens quietly, through hundreds of small decisions that gradually strengthen the relationship between what you earn, what you spend, what you owe and what you own. That is the real purpose of a financial health check.

The next time someone asks how much you earn, the answer may tell them something about your income, but it will not tell them whether you are financially fit. For that, you need to look deeper at how much you save, how much you invest, how heavily you rely on debt, how prepared you are for emergencies, how much of your wealth is genuinely yours and whether today's financial choices are preparing you for the years when your salary will eventually stop.

Financial fitness is not about earning the highest salary or building the largest portfolio. It is about creating enough financial strength that your present lifestyle does not compromise your future, while your future goals do not make your present life financially fragile. The numbers may be simple, but when viewed together, they can reveal a great deal about the financial life you are actually building.

**Reach for opportunities
of all sizes.**

Across large, mid and
small caps.

Invest in

ICICI Prudential
Multi Cap Fund*

*Investors please note that the name of the scheme has been changed from ICICI Prudential Multicap Fund to ICICI Prudential Multi Cap Fund with effect from August 26, 2026.
