When prices differ, smart investors capture the spread

INVEST WITH ARBITRAGE FUNDS

Arbitrage Funds aim to benefit from price differences (or price spreads) between the cash and derivatives markets. By simultaneously buying a stock in the cash market and selling it in the derivatives market, these funds seek to capture the price spread between the two. By capturing these spreads, the strategy focuses on opportunities created by temporary market inefficiencies rather than relying on market direction. This approach can help limit exposure to broad market movements.

FIRST PAGE

Such a long journey

Dhirendra Kumar
Editor-in-chief

Our cover story this month opens with a number that should give every long-time investor pause. The largest active equity fund in India now manages over ₹1.25 lakh crore. The largest small-cap fund is over ₹60,000 crore. The story treats these as recent surprises, numbers nobody seriously expected to see five years ago.

I want to take the time horizon back further, to a time before SIPs were a habit and before mutual funds were a dinner table conversation.

When this magazine published its first issue in 2002, the entire Indian mutual fund industry managed around ₹1 lakh crore. A single fund today is larger than the whole industry was when we began. The industry itself now stands at over ₹73 lakh crore. That is not a dry statistic. It is the arc of an entire investing culture.

Here is what I keep coming back to. If someone had described today's numbers to us in 2002, we would have thought it implausible. We would have asked which crisis, which regulatory failure, which mis-selling scandal would have to occur to push the industry to that scale. We would not have predicted the answer that actually emerged. Crores of ordinary Indians would slowly become convinced that putting a few thousand rupees away every

month into a mutual fund was the most sensible thing they could do with their savings.

The story of the past 23 years is not really an industry story. It is the story of a country learning a habit.

That habit is now expressing itself in the size of individual funds, and our cover story does an honest job of documenting what such growth has done to the funds themselves. A scheme that began with 20 high-conviction

- India learned to invest, funds grew massively
- Not every fund change needs investor action
- Staying put beats reacting to every change

positions in a few thousand crores now holds well over a hundred names in a portfolio many times that size. The cap mix has shifted. Exit timelines have stretched. The fund the investor bought is not, in any meaningful sense, the fund he now owns.

I want to say something here that runs against the reader's instinct after absorbing those findings. Real change in a long-term holding is not, by itself, a reason to act. The instinct that says something has changed and

therefore something must be done is one of the most expensive instincts an investor carries. Companies revise their business mix. Fund managers retire. Markets evolve. Regulators rewrite the rules. The investor who has done well over 23 years has done so by recognising that change is the rule, and that only some changes carry a real investment consequence.

Our cover story is careful to distinguish the two. In small-cap funds, the bloat is real and shows up in the returns. That is a change worth acting on. In the remaining categories, the funds have changed shape but continue to deliver the returns investors signed up for. That is a change worth acknowledging and then setting aside.

The investors who did best over the past two decades were not the ones who responded to every shift. They were the ones who chose well and then mostly stayed out of the way. The industry's growth required nothing of them except the willingness to let it happen. The same is true of fund size today. Some of it needs close inspection. Most of it just needs the discipline of doing nothing.

The next 23 years will hold their own surprises. The investor whose portfolio survives them will be the one who can tell the difference.

DHIRENDRA KUMAR

Why we built it this way

How every design choice in Value Research Fund Advisor is a deliberate answer to what makes Mutual Fund PMS a bad deal

A co-founder of a Mutual Fund PMS firm posted on X last week, sharing an article that praised his own structure. The investors in the replies had brought their calculators. The numbers did not look good for PMS, the discussion lengthened, and a few days later, it became the angriest column I have written this year. The newspaper headline was “The compounding killers.”

The job there was to puncture a marketing narrative for the general reader. The job here, in front of **Mutual Fund Insight** readers, is the opposite. It is to explain, as plainly as I can, why our service has the shape it has.

Because almost every design choice in the **Value Research Fund Advisor** is a deliberate rejection of the very things that make Mutual Fund PMS such a poor deal.

Start with cost, the simplest of the three problems. A direct mutual fund already runs at 0.5 to 1 per cent for an equity fund. The PMS sits on top and adds its own fee, often in the form of a profit share of 10 or 20 per cent on returns above a threshold. On a portfolio earning 12 to 14 per cent a year, that hands the manager two to three percentage points of return. A compound that dragged for 20 years on a ₹1 crore corpus, and the gap between paying it and not paying it is close to ₹3 crore. No investment skill is required to widen that gap. It is built into the structure.

The second problem is tax. When a PMS

manager rebalances by selling one scheme and buying another, the rebalancing happens in your demat account. Every switch is a redemption. Every redemption is a taxable event. A direct mutual fund portfolio, by contrast, can sit untouched for decades while the manager rebalances inside the scheme without triggering tax for you. The PMS structure converts a tax-efficient vehicle into a tax-inefficient one, and the cost is invisible until you do the maths.

The third problem, and the most damaging, is the incentive. A profit share without real downside for the manager is not alignment. It is a one-way bet. If your portfolio rises, the manager earns handsomely. If it falls, the manager earns nothing, but the manager also loses nothing. The asymmetry shapes behaviour. The manager has every reason to chase short-term performance, to switch out of a fund going through a dull patch, to demonstrate activity. Your actual edge as an investor is sitting still through the boring middle while a good fund recovers, precisely the behaviour this structure punishes.

That is the diagnosis. Now to the prescription, which is the reason Value Research Fund Advisor exists in its current form.

We charge a flat fee. No profit share. No commission from any fund house. No hidden bouquet of upfront and trailing charges

■

The PMS structure converts a tax-efficient vehicle into a tax-inefficient one, and the cost is invisible until you do the maths

Illustration: Anand Kumar

layered into your investment. A year of Fund Advisor costs less than ₹5,000, and the trial begins at ₹490. Whether you invest ₹5 lakh or ₹50 lakh, the fee does not change. This is not a marketing position. It is the only structure under which our interests and yours can run in the same direction. If your portfolio grows, we do not earn more. If it shrinks, we do not earn less. What we earn depends on whether you find our advice useful enough to renew. That is the only test that matters.

We help you transact only in direct plans. The direct plan of an equity fund saves you around 1 per cent in expense ratio each year compared with the regular plan, and over a long holding period, that 1 per cent adds up to a remarkably large amount. There is no distributor commission baked in because there is no distributor. You hold the units directly with the fund house, in your own name, and you can leave whenever you like.

Crucially, we do not take custody of your investments. There is no separate demat account. There is no wrapper sitting between you and the funds you own. When our analysts upgrade or downgrade a scheme, we say so through our Buy, Sell, Hold and Avoid opinions, and through the **Analyst's Choice** list of our highest-conviction recommendations. You decide whether to act. If you do act, you act on your own timetable, with full visibility on the tax consequences. There is no manager somewhere churning your portfolio to justify a

quarterly performance number. The only person who can churn your portfolio is you. And we spend a fair bit of effort gently persuading you not to.

What you get instead is the machinery that helps you do the right thing without effort. **Portfolio Planner** builds a personalised set of recommendations from your goals, time frame and risk appetite. **Portfolio Analysis** takes whatever you already own, across up to six members of your family in a single account, and tells you, parameter by parameter, what is working and what is not. **Fund Advisor Live**, our monthly session, lets you bring your questions directly to my colleagues and me. None of this is sold as alpha. It is sold as the thing that actually compounds investor wealth over decades, which is good behaviour supported by good information.

I closed that newspaper column by saying that the right approach is to leave compounding alone and let it do what it does best. Fund Advisor, in essence, is an attempt to industrialise that one sentence. We have spent years building a service that stays out of compounding's way while making sure you do too. The annual subscription is a small price to pay for a structure that, by its very design, cannot work against you. Take the ₹490 trial and bring in your existing portfolio. You may well find that what you most needed was not another layer of overcleverness on top of your investments, but the absence of one. ☑

Leave compounding alone and let it do what it does best. Fund Advisor is an attempt to industrialise that one sentence.

Move between market caps for more opportunities.

Choose Flexicap funds that aim to benefit from opportunities across large, mid and small caps.

A Flexicap fund has the flexibility to invest across large, mid and small cap stocks. This unrestricted nature of the fund enables the fund manager to pursue multiple investment opportunities across the market and tap them regardless of their size. Since they provide exposure to a broad equity spectrum i.e across market caps and sectors, it leads to a well-diversified portfolio striking a balance between risk and returns in a single portfolio.

To know more, speak to your mutual fund distributor/financial advisor for more advice on how flexicap funds can be part of every portfolio.

Letters to the Editor's Note

Your responses to the April 25 editorial, 'Nothing ever happens'

Dhirendra Kumar's Editor's Note, *Nothing ever happens*, published on April 25, 2026, used a simple trading bot to illustrate why most investors lose money chasing short-term outcomes. He argued that reacting to constant news flow often leads to costly mistakes, while doing nothing is usually the better choice.

The piece resonated with readers who recognised how noise, urgency and overconfidence can quietly derail long-term investing discipline.

Aditya Roy/AI-generated image

Summary

A software engineer recently built a bot for Polymarket that does something absurdly simple: it bets “No” on every prediction. It doesn’t read news, analyse data or track geopolitics. It simply assumes that nothing will happen. He called it, aptly, *Nothing ever happens*.

The logic, surprisingly, works. Polymarket’s own data shows that roughly 73 per cent of predictions resolve as “No.” The dramatic events that dominate headlines rarely materialise. Even more telling, an overwhelming 84 per cent of traders lose money. Most would have been better off doing exactly what the bot does—assume nothing and stay out. Its advantage lies not in intelligence,

but in its immunity to noise that constantly misleads human decision-making.

Replace Polymarket traders with derivatives traders in India, and the pattern remains unchanged. SEBI’s data shows that nearly 90 per cent of individual F&O traders lose money. Armed with information and confidence, they try to predict short-term movements and consistently lose to mathematics. One trader, despite being right 65 per cent of the time, still lost ₹3.2 lakh because his losses were far larger than his gains.

A few bad trades wiped out months of steady profits.

But the deeper lesson is not about betting platforms or

derivatives. It is about how investors react to news. Every week brings something that feels urgent—a crisis, a policy shift, a technological breakthrough. The message is always the same: act now. Yet, in hindsight, the correct response is almost always to do nothing and allow time to play out its role.

The bot reflects a principle long ignored by investors: don’t react to noise, don’t try to predict the near term, and don’t confuse activity with progress. A simple SIP into a few well-chosen funds will outperform most active decision-making. The most useful investing skill is accepting that most of the time, nothing much happens—and acting accordingly.

High conviction, unlocked.

Invest in the most unique Small & Mid Cap opportunities to power your portfolio.

[READERS' VOICE]

What our readers say

Your note resonated deeply and reminded me of lessons from my school days. At Ramakrishna Mission High School, we were taught to avoid “Trivignna”—all forms of distraction—to achieve our goals. Those who followed this discipline went on to succeed in life.

Abhijit Roy Goswami

In investing too, noise from social media, influencers and advisors creates confusion. What investors need is a trusted guide who can keep them focused. Your note serves as such a “Margdarshak” in today’s uncertain environment.

You are absolutely right. Patience is key, not just in life, but in markets as well. Interestingly, we often make better decisions when we are at our lowest point, rather than at our peak, when overconfidence can take over.

Sandeep Ahlawat

A wonderful and practical note worth following. Those who remain patient and ignore noise are the real winners. As you said, we should not react to news, try to predict the near term or confuse activity with progress. Long-term investing with discipline and without borrowing is the way forward.

Gopala Krishnan

I find the turn of events regarding Polymarket amusing. I come from the IT industry, which gives me a certain insider’s perspective. I will not shed a tear for someone who claims to understand the Greeks yet consistently loses money. Understanding options theory is one thing; absorbing the lessons of Greek tragedy is

quite another, and in my experience, the latter rarely happens. People in IT tend to mistake fluency in jargon for genuine understanding. They can sound impressive while being quite wrong about almost everything that matters, sometimes even in their own field.

Srinivas Chillara

Great to read your thoughts every Saturday. Even when I know the message, your ability to weave in current events makes it refreshing. I’ve stayed away from F&O, having heard enough warnings, including yours. Equating it to betting is deterrent enough.

I do hear about using options

as a hedge, but I haven’t explored it yet. I have a slightly contrarian view on the “fill it and forget it” SIP approach. While I understand the intent, how does one consistently choose winning funds? No fund can remain in the top 10-15 per cent year after year. I believe investors should

periodically review performance and pivot if needed, neither over-monitoring nor ignoring completely.

Also, reacting blindly to news is wrong, but analysing developments and acting with conviction seems reasonable.

Is your term insurance cover actually enough?

Most pick a round number and move on. Here's how to think about cover.

By Siddhant Madhav Joshi

Most people approach term insurance with a number in mind—₹50 lakh, ₹1 crore, or ₹2 crore. Sometimes it comes from an agent's suggestion. Sometimes, from what feels large enough. But there is a more important question that rarely gets asked: enough for what?

Unless you define what your insurance is meant to protect, any number you choose is arbitrary. And arbitrary decisions in financial protection can be deeply costly.

Term insurance has one job

Term insurance is not an investment. It is not meant to create wealth or deliver returns. Tax saving is a secondary benefit, not a reason to buy.

A term plan has one job: to ensure your family's financial life does not collapse in your absence. Once you accept this, the question of how much is enough stops being about round numbers and starts being about responsibilities.

What your cover must actually protect

Your family does not depend on your net worth. It depends on your monthly income. When that flow stops, the impact is immediate. Your insurance must replace your income for a meaningful period, typically 10 to 15 years.

The right number depends on your situation like how long before your youngest child becomes financially independent, whether your spouse earns an income and how your household is structured.

Your cover must also be sufficient to clear all liabilities without forcing difficult decisions. Loans do not disappear when you do. An unprepared family can be pushed into selling assets under pressure at the worst possible time. These are not aspirations, but commitments that your

insurance must keep.

A practical way to size your cover is to assess three things together: income replacement, outstanding liabilities and future financial goals. This keeps your planning anchored in purpose rather than guesswork.

A simple check

Most people are underinsured and often by a significant margin. The most common mistakes people make while calculating their insurance needs are:

- Not accounting for all the important future goals.
- Ignoring inflation while estimating future expenses.
- Overvaluing employer-provided cover because it disappears the moment you switch jobs or are let go.

Ask yourself three questions:

- Can your cover replace at least 10 years of your income?
- Can your cover fully clear your largest loan?
- Can your family maintain their lifestyle without any immediate cutbacks?

If the answer to any of these is no, your cover needs to be revisited. Start by recalculating your cover using the three anchors above—income replacement, liabilities and goals. Then compare what you have against what you actually need. The gap, if there is one, is worth closing sooner rather than later. ☒

What your cover must protect

Income for 10-15 years

Outstanding liabilities

Future financial goals

The world might be

Twenty-one years of equity leadership, and

Returns (in % p.a.)

Data from January 1, 2005 to April 30, 2026. Index returns are denominated in INR. * Returns for 2026 are absolute from January 1 to April 30.

The case for going global

The instinct to stay home is understandable. India has been among the world's best-performing equity markets for two decades. But that same record shows why a portfolio anchored entirely at home is taking a bigger bet than it appears.

Across rolling three-year windows over 21 years, leadership keeps changing. China in 2005-07, the US through the QE years, Taiwan through the AI era, and

India during the pandemic. No market has held the top spot for more than two consecutive windows. Yet over 21 years, major indices land within a tight band, from 9.8 per cent for the Nikkei to 13.5 per cent for MSCI Taiwan. This is the diversification dividend. A 10-30 per cent allocation to global equities does not sacrifice long-term returns. It smooths the journey by keeping you invested in the market that leads next.

compounding without you

the case for a passport on your portfolio

What home bias really costs

India tops only one of the eight windows above. The defining stories of this century, AI hardware, semiconductors, and US software platforms, are not written on Indian exchanges. They trade on the New York, Taipei and Hong Kong exchanges. Hence, going global is not a vote against India. It simply recognises that the rest of the world's growth need not be left on the table.

Building the global slice

For most Indian investors, the cleanest entry points are international feeder funds and ETFs. Feeder funds stop accepting inflows when overseas limits are hit. ETFs remain open but often trade at a premium to NAV. GIFT City offers a second route. A small set of funds track the S&P 500, MSCI World and MSCI ACWI, spanning developed and emerging markets. But, these investments draw on LRS quota.

A first in India's gold history

Investors, not buyers, drove gold demand for the first time in history

By Harshita Singh

For the first time, Indians bought more gold to invest than to wear. In the January-to-March quarter of 2026, India consumed 82 tonnes for investment through ETFs, coins and bars, compared with 66 tonnes for jewellery, according to the World Gold Council. Bars and coins alone accounted for 62 tonnes. Gold ETFs added another 20 tonnes, a record high.

That is a striking break from India's old gold habit. Jewellery has long been the emotional centre of gold demand, tied to weddings, festivals and family security. This last quarter, it became secondary. Jewellery volumes fell 19 per cent from a year ago as soaring prices hurt retail demand.

The most dramatic shift came through ETFs. India accounted for 32 per cent of global ETF gold demand, second only to China. In January 2026, India's gold ETFs saw their highest-ever monthly inflow of ₹24,040 crore. The excitement cooled quickly, though. Inflows fell sharply in February and March as prices corrected. That tells us something important. Much of this rush is not about thoughtful asset allocation. It is performance chasing.

Recent returns betray the long-term record

Gold has given investors reason to look. Gold mutual funds returned nearly 74 per cent on average in 2025, while large-cap funds managed a modest 9 per cent. But recent returns are not the same as long-term reliability.

India gold consumption, Jan-Mar 2026

Consumption demand vs Investment demand

Bars and coins, and ETFs make up investment demand.

Source: Metals Focus, Bloomberg, World Gold Council. Data as of March 31, 2026.

Our five-year rolling return analysis shows that if you had held an average gold fund for any five-year period since June 2005, there was still nearly a 10 per cent chance of losing money. For an average large-cap fund, that probability was just 0.5 per cent. Equity is volatile in the short run but over five-year periods it has been far more dependable.

The longer record is even more revealing. Since 1981, gold has beaten the Sensex in only three five-year stretches: 2006-2010, 2016-2020 and 2021-2025.

A diversifier, not a driver

Gold can have powerful phases, but they have been rare. It shines when

equities struggle and protects when confidence weakens. But it is not a wealth-building engine. Investors often discover gold after it has already done well, buying when returns are spectacular and fear around equities is high. That is rarely the best way to build a portfolio.

At Value Research, our view is clear. Gold has a place, but a limited one. It generates no profits, dividends or cash flows. Equity remains the superior long-term wealth creator. Treat gold as a cushion, not the core — cap it at around 10 per cent of your portfolio and resist the temptation to raise allocation just because last year's returns look dazzling. ☒

SIP in a hot market?

The starting point feels everything. Over a long period, it means little.

By **Abhishek Rana**

Equity markets do not move in straight lines. They swing between optimism and pessimism, dragging valuations from expensive to cheap and back again. Every time they do, investors find a new reason to hesitate. When markets rise and valuations look stretched, starting a SIP feels risky. When they fall, the dread of buying into a further decline keeps investors on the sidelines.

The real question is this: does market valuation when you start a SIP actually shape your long-term returns? To answer that, we turned to BSE Sensex's historical P/E data and checked how starting at different valuations affects returns.

Our test

The market was considered overvalued when Sensex P/E was above its five-year trailing average by 10 per cent or more in any month between April 2003 and April 2026. This gave us 100 overvalued months and 64 undervalued ones. We then asked: if a SIP was started in each of these months in an average regular large-cap fund, what would returns have looked like over the next one, three, five, 10 and 15 years?

The results

Starting in an undervalued month gave a 56 per cent chance of making excellent one-year returns exceeding 20 per cent. The chance of losses was just 3.5 per cent.

If you began when the market was overvalued, on the other hand, your chances of making losses in the next

100 Overvalued months	64 Undervalued months	277 Months studied
---------------------------------	---------------------------------	------------------------------

Market's valuation journey, 2003 to 2026

Sensex: Overvalued 36 per cent of the time and undervalued 23 per cent

Sensex P/E data from April 2003 to April 2026. April 2003 is the earliest point at which a full five-year trailing average could be computed. Months considered undervalued when Sensex P/E was below this average by 10 per cent or more; overvalued when it was above the average by 10 per cent or more.

When SIPs began in cheaper markets

Most crossed 20 per cent in year one.
After 10 years, most settled in a steadier range.

56%

Chance of >20%
return in year one

Early differences, similar endings

Early advantage of a cheaper start almost vanishes over 15 years

Based on SIP returns of an average large-cap regular fund from April 2003 to April 2026. Months considered undervalued when Sensex P/E was below its five-year trailing average by 10 per cent or more; overvalued when it was above the average by 10 per cent or more.

Your early returns can therefore sizably differ depending on when you begin. If you invest at lower levels, your one-, three- and five-year returns can be meaningfully higher. But over 10- and 15 years, the returns will be similar to when you had begun at a pricier level. The starting point, which feels so consequential at first, gradually ceases to matter over longer horizons.

The lesson is to start and stay

When you start a SIP has little bearing over long-term outcomes. The more crucial step therefore is to simply start. Do not wait for a correction if the markets are on a bull run and running expensive valuations. Do not delay waiting for stability when they are falling. Both impulses feel rational but will lead to you staying out. And that is more damaging than starting at an expensive valuation ever would be.

Valuations do shape the early journey, sometimes meaningfully so. But they rarely determine the destination. Across longer stretches, the advantage of starting in cheap markets shrinks to the point where it is almost irrelevant.

What matters more is starting and then staying. The discipline of regular investing and the compounding of returns over time are the two forces that drive long-term SIP outcomes.

Neither requires you to worry about market corrections.

So the next time the market looks expensive and you consider waiting, or it looks cheap and you hesitate anyway, remember investors who started SIPs at inflated market levels still ended up in roughly the same place 15 years later as those who started in undervalued markets. The early pain was real. The long-term difference was not. ☒

matter whether you started in a cheaper market or an overpriced one. Over 15 years, the likelihood improves to 90 to 100 per cent, no matter the starting point.

Simply put, it is true that timing affects returns, but only in the short term. Staying invested for longer stretches, at least a decade or more, will mostly lead to realistic double-digit returns even if you began investing at inflated prices.

Another data point proves this. The average annual returns in both cases are more or less similar when

held for a continued long stretch. So at the end of 15 years, both types of SIPs—started at higher levels and lower—resulted in average returns of 12 and 12.4 per cent, respectively. Nearly identical.

On the other hand, the shorter the holding period, the higher the effect of timing. Over five years, a SIP started at an inflated multiple would have generated 3.3 per cent lower returns than the one started at a lower one. Over a year, the gap would have been a wide 26.3 percentage points.

When SIPs began in pricier markets

The first year was painful. After a decade, most were earning 10-20 per cent annually.

28%

Chance of losses in year one

SIP return buckets (% pa)	Probability of returns (% of time)				
	Next 1 year	Next 3 years	Next 5 years	Next 10 years	Next 15 years
Less than 0%	28	10	0	0	0
Between 0 to 10%	26	26	26	16	0
Between 10 to 20%	11	35	69	84	100
More than 20%	35	29	5	0	0

SIP returns of an average large-cap regular fund from April 2003 to April 2026. Months considered overvalued when Sensex P/E was above its five-year trailing average by 10 per cent or more.

I didn't understand risk. Until I understood myself.

What a market fall revealed about my real risk tolerance

When I started investing, I did what most first-timers do. I read a little, asked around a little more, and concluded that I was a risk-taker. I was 24, earning steadily, with no major financial obligations. On paper, I had every reason to be aggressive. So, I went straight into high-risk funds with exciting recent returns.

For several months, things looked pleasant. The portfolio was growing, and I felt rather clever about the whole thing.

Then the market started correcting.

Within a few weeks, my portfolio had fallen meaningfully. Nothing catastrophic by market standards, but enough to make me uncomfortable. What surprised me was not the fall itself. It was how I felt about it. I refreshed my portfolio screen far too many times each day. I lost sleep over a few percentage points. I began questioning every fund choice and nearly redeemed everything at the worst possible moment.

That reaction told me something important. I had assessed my risk appetite, the risk I was willing to take, and completely overlooked my risk capacity, the risk my financial situation and emotional

temperament could actually absorb. The two turned out to be quite different.

After some reflection, I spoke with a financial adviser who helped me reframe the question. Rather than asking what kind of investor I wanted to be, she asked what a loss would actually mean for me at this stage of life. The answer reordered everything.

I restructured my portfolio, keeping growth-oriented exposure but balancing it with more stable

instruments to reduce volatility.

The portfolio became less dramatic and far easier to stay invested in.

That last part mattered most.

Staying invested without panic is worth considerably more than chasing the highest possible return with money you cannot emotionally afford to lose.

Conclusion

Risk appetite and risk capacity are often mistaken for the same thing. Risk appetite is how much risk an investor feels comfortable taking. Risk capacity is how much risk their financial situation and mental temperament can genuinely absorb. The gap between the two is where most early investing mistakes are made.

Choosing funds that match both is essential. An overly aggressive fund chosen purely on return potential, without accounting for how one might respond during a downturn, can lead to panic redemptions at precisely the wrong time.

Understanding oneself as an investor, honestly and without flattery, leads to better fund choices, steadier behaviour during volatility, and a far greater chance of staying on course when markets become unsettling. ☒

Adobe Stock

Key takeaways

- Risk appetite and risk capacity are not the same
- Choose funds your temperament can keep you invested in
- Self-awareness leads to steadier, smarter investing

Mutual Fund investors need to complete the Know Your Customer (KYC) process, which can be done by submitting completed KYC Form along with the required documents at any AMC's branch Office or Official Points of Acceptance. Please refer <https://www.licmf.com/kyc-redressal> to know about KYC documentary requirement, procedure for change of address, phone number, bank details etc. The investors are cautioned to invest only with SEBI registered Mutual Funds, the details of which can be verified on SEBI's website under 'Intermediaries / Market Infrastructure Institutions' (<https://www.sebi.gov.in/intermediaries.html>.) For any complaints and grievance redressal, investors can contact the Investor Relations Officer of the respective AMC and if not satisfied with the resolution given by the AMC, he/she can approach SEBI by registering the complaint on SEBI SCORES Portal (<https://scores.sebi.gov.in/>) and/or escalate the complaint through Online Dispute Resolution Portal (<https://smartodr.in/login>).

MUTUAL FUND INVESTMENTS ARE SUBJECT TO MARKET RISKS, READ ALL SCHEME RELATED DOCUMENTS CAREFULLY.

The factor satellite test

Five factor strategies, three portfolio mixes, one honest question: do factor funds earn a place alongside your core flexi cap?

By Siddhant Madhav Joshi

Stock markets reward certain stocks more than others. Cheap ones tend to outperform expensive ones. Profitable companies outlast weak ones. Stable, low-risk businesses hold up better when markets fall. Factor investing builds on this: identify the traits, build a portfolio, beat the market.

Momentum buys rising stocks. Quality favours profitable, financially stable businesses.

Value hunts for cheap stocks. Low Volatility prefers steadier names.

Alpha targets the strongest risk-adjusted outperformers. Together, these strategies span 86 schemes as of April 2026, and are growing fast.

A compelling idea, with caveats

Over long periods, these factors have often beaten broad market indices. But our position at Value Research

has been one of caution. That has not changed.

Factor strategies follow a deliberate tilt, often diverging sharply from the market and testing investor patience at the worst time. Indian track records are short; long-term returns rely on backtested data.

Yet dismissing them entirely is simplistic. The better question: can factors improve a portfolio as a satellite, not as the main engine?

How we ran the test

Three questions. Does a factor improve a flexi-cap portfolio? Does it beat a mid-cap fund? Which factor - Alpha, Momentum, Quality, Value, or Low Volatility - earns that satellite space?

The three test portfolios:

- 100 per cent flexi cap. Median daily return of all active flexi-cap funds.

- 70 per cent flexi cap + 30 per cent mid cap. Most factor indices already tilt mid- and small-cap, making this the practical benchmark.

- 70 per cent flexi cap + 30 per cent factor index, using Nifty Alpha 50 and the Nifty 500 versions of Momentum 50, Quality 50, Value 50, and Low Volatility 50.

Four measures:

- Five-year rolling return median: compounding outcome.
- Standard deviation of rolling returns: volatility.
- Hit rate: outperformance frequency.
- Worst drawdown: sharpest fall.

We also tested each factor against its parent index across three- and five-year rolling periods from April 2008 and April 2010.

The results are revealing. Some factors improve portfolios. Others look less less appealing.

What each factor buys

Each factor bets on different stock metrics to filter winning stocks

 ALPHA	 MOMENTUM	 QUALITY	 VALUE	 LOW VOLATILITY
Bets on Stocks that have delivered the highest risk-adjusted returns	Bets on Stocks whose prices have risen most over the recent past	Bets on Profitable, low-debt, stable-earnings businesses	Bets on Stocks trading cheap relative to fundamentals	Bets on Stocks with the smallest price swings
Metrics Trailing 12-month Jensen's Alpha (excess return over the market)	Metrics 6-month and 12-month price returns, adjusted for daily-return volatility	Metrics Return on Equity, Debt-to-Equity ratio, EPS growth variability	Metrics Earnings yield, Book value to price, Sales to price, Dividend yield	Metrics Trailing 12-month standard deviation of daily price returns

Chasing the winners: Alpha

Alpha picks stocks that have delivered the strongest risk-adjusted excess returns over a benchmark in the trailing 12 months. In India, the space remains small, with just seven passive funds.

The strategy has worked. Every Alpha index has beaten its parent across both three- and five-year windows. But higher returns came with higher risk: more volatility, sharper drawdowns.

Alpha turned out to be one of the strongest satellite strategies tested. A 30 per cent Alpha allocation lifted the flexi-cap portfolio's median five-year rolling return from around 13 to nearly 15 per cent per annum.

More importantly, Alpha beat pure flexi cap in nearly 78 per cent of five-year periods, and the flexi-cap plus mid-cap benchmark in almost 77 per cent. But the outperformance was not smooth.

Alpha struggled for long stretches in sideways or sharply rotating markets. The strategy depends on existing winners to keep winning. When the trend breaks, Alpha is left holding yesterday's winners.

The verdict: Alpha can meaningfully improve portfolio returns as a satellite, but investors must stomach sharper swings and stretches of disappointing relative performance.

Concentration at the broadest end

● Nifty Alpha 50 ● Nifty 200 Alpha 30

Including all the ETFs and Index funds tracking respective indices. Data as of April 23, 2026.

When market trend shifts, alpha struggles

Five-year rolling outperformance of the 70:30 flexi-alpha portfolio over the two benchmarks

Returns of Nifty Alpha 50 TRI from April 1, 2005 to April 23, 2026 are considered. Category median returns of active flexi-cap and mid-cap funds (regular plan) are considered.

Alpha fell more

Outperformance comes with higher drawdown risk

● 100% Flexi cap
● 70% Flexi cap + 30% Mid cap
● 70% Flexi cap + 30% Nifty Alpha 30

Crash periods were the worst three falls of the 70:30 flexi-cap + mid-cap portfolio. Period considered from April 1, 2005 to April 23, 2026.

Big returns, big swings

Alpha indices have outperformed their parents consistently but at sharply higher drawdown risk

sharply higher drawdown risk

Nifty 100 Alpha 30	16.2	16.1	72.0	72.0												
Nifty 200 Alpha 30	19.7	18.0	76.9	77.4												

Parent indices considered are Nifty 100, Nifty 150 and Nifty Smallcap 50 (in equal proportion) for Nifty Alpha 50; Nifty 100 for Nifty 100 Alpha 30; and Nifty 200 for Nifty 200 Alpha 30. Rolling returns data considered from April 1, 2005 to April 23, 2026. Performance margin shows how widely spread the factor's relative performance has been over time; Min shows widest underperformance; Max shows widest outperformance.

Riding the trend: Momentum

Momentum buys stocks whose prices have risen the most recently. The rule is simple: stay with leaders while the trend holds. In India, this is the most crowded factor space, with 22 passive funds tracking two of three momentum indices.

All three indices have nearly always beaten their parents over five-year windows. The Nifty Midcap 150 Momentum 50 has never lost to its

parent. Momentum worked best as a satellite. The flexi-momentum portfolio's median five-year rolling return of 15.5 per cent per annum was the highest among factor satellites. It beat pure flexi cap 96 per cent of the time and the flexi-cap plus mid-cap mix 93 per cent - the most consistent factor.

But it is not a one-way machine. Two weak phases stand out: 2010-2013, when markets moved sideways,

and the post mid-2024 correction, when Momentum's lead over flexi-cap plus mid-cap collapsed. In both cases, leadership changed quickly.

This is Momentum's vulnerability, much like Alpha's: it works when winners keep winning, and breaks when leaders rotate.

The verdict: Momentum is the strongest return booster, but demands tolerance for sharp reversals when trends break.

A wider net

- Nifty 200 Momentum 30
- Nifty 500 Momentum 50

Includes all ETF and index funds tracking indices (incl. BSE 500 Momentum 50 index).

A long stretch of dominance but with clear painful phases

Five-year rolling outperformance of the 70:30 flexi-momentum portfolio over the two benchmarks

6% pa Performance margin over: ● 100% Flexi cap ● 70% Flexi cap + 30% Mid cap

Returns of Nifty 500 Momentum 50 TRI from April 1, 2005 to April 23, 2026 are considered. Category median returns of active flexi-cap and mid-cap funds (regular plan) are considered.

Lacks protection in falls

Momentum satellite tracks mid cap satellite's falls

Buying the unloved: Value

Value buys stocks that are cheap relative to fundamentals - low price-to-earnings or price-to-book ratios, or high dividend yields. The idea is simple; markets periodically misprice good businesses, and buying them at low valuations is rewarded over time. Just 16 passive funds track three value indices.

Performance has been mixed. The large-cap Nifty 50 Value 20 has

been remarkably effective - 92 per cent hit rate over five-year periods, no negative return since January 1, 2009. But the broader Nifty 500 Value 50 - used in our satellite test - has been different: bigger rallies, sharper disappointments.

Value works in bursts, when markets shift from expensive growth to cheaper stocks. That explains its prolonged weak phase between 2014-2022, when growth

and quality dominated.

Value is far less defensive than many investors expect. The flexi-value satellite's drawdowns were deeper than Quality and closer to Momentum. Cheap stocks are often cheap for a reason: weak balance sheets, cyclical earnings.

The verdict: Value delivers powerful rebounds but is unreliable as a steady satellite. Its defensive reputation is overstated.

Three flavours of Value

- Nifty 50 Value 20 ● Nifty 200 Value 30
- Nifty 500 Value 50

Includes all ETFs and index funds tracking indices. (Incl. BSE Enhanced value funds under Nifty 200 Value 30 due to similar universe).

Value outperforms in buckets

Five-year rolling outperformance of the 70:30 flexi-value portfolio over the two benchmarks

Returns of Nifty 500 Value 50 TRI from April 1, 2005 to April 23, 2026 are considered. Category median returns of active flexi-cap and mid-cap funds (regular plan) are considered.

Bigger falls than expected

Contrary to popular belief, value fails to work as a risk diversifier

- 100% Flexi cap
- 70% Flexi cap + 30% Mid cap
- 70% Flexicap + 30% Nifty 500 Value 30

Crash periods were the worst three falls of the 70:30 flexi-cap + mid-cap portfolio. Period from April 1, 2005 to April 23, 2026 considered.

Better at the top end of the market

Value indices are volatile and inconsistent while showcasing outperformance

										■ Median ■ Middle 50% — Min and Max									
Index	Avg. Ret. (% p.a.)		Hit rate (%)		Performance margin over parent index (% pa)														
					3y rolling					5Y rolling									
	3Y	5Y	3Y	5Y	-30	-20	-10	0	10	20	30	-20	-10	0	10	20	30		
Nifty 50 Value 20	15.3	15.8	86.7	92.1															
Nifty 200 Value 30	14.6	12.5	52.3	47.8															
Nifty 500 Value 50	16.7	13.6	55.6	56.8															

Parent indices considered are Nifty 50, Nifty 200 and Nifty 500. Rolling returns data considered from April 1, 2005 to April 23, 2026. For Nifty 50 Value 20, returns considered from January 1, 2009 (index base date) to April 23, 2026. Performance margin shows how widely spread the factor's relative performance has been over time; Min shows widest underperformance; Max shows widest outperformance over time.

The steady hand: Low Volatility

Low Volatility buys stocks that fluctuate the least, measured by standard deviation. The idea is counterintuitive: conventional finance says higher risk should produce higher returns. Yet low-volatility stocks have often delivered market-like returns with smaller swings.

In India, the strategy has worked surprisingly well. Low Volatility indices beat their parents 75 to

94 per cent of the time over five-year periods, with lower price fluctuation.

The satellite behaved as advertised: a median five-year rolling return of 13.8 per cent per annum, matching the flexi-cap plus mid-cap mix but with the lowest volatility of any portfolio tested. It beat pure flexi cap 88 per cent of the time.

The trade-off shows against the flexi-cap plus mid-cap blend, where Low Volatility won only half the time.

Stable stocks naturally lag in strong bull markets, when volatile mid- and small-caps surge.

The underperformance was narrower than other factors - the satellite never trailed the mid-cap blend by more than 2.5 percentage points.

The verdict: Low Volatility matches the mid-cap portfolio's returns with the smallest swings - the strongest case for investors.

Large cap dominates

- Nifty Low Volatility 50
- Nifty 100 Low Volatility 30
- Nifty 500 Low Volatility 50

Includes all ETFs and index funds tracking indices. (Incl. BSE Low Volatility funds under under Nifty Low Volatility 50 due to similar universe).

Low-vol earns its keep

Low-vol reduced damage in every market fall

- 100% Flexi cap
- 70% Flexi cap + 30% Mid cap
- 70% Flexi cap + 30% Nifty 500 Low Volatility 30

Crash periods were the worst three falls of the 70:30 flexi-cap + mid-cap portfolio. Period considered from April 1, 2005 to April 23, 2026.

When market trend shifts, Alpha struggles

Five-year rolling outperformance of the 70:30 flexi-alpha portfolio over the two benchmarks

4% pa Performance margin over: ● 100% Flexi cap ● 70% Flexi cap + 30% Mid cap

Returns of Nifty 500 Low volatility 50 TRI from April 1, 2005 to April 23, 2026 are considered. Category median returns of active flexi-cap and mid-cap funds (regular plan) are considered.

Low Volatility offers something rare

It improved return consistency with lower volatility across all three index universes

Index	Avg. Ret. (% p.a.)		Hit rate (%)		Outperformance variance (%)									
					3y rolling					5Y rolling				
	3Y	5Y	3Y	5Y	-20	-10	0	10	20	-20	-10	0	10	20

Nifty 500 Low Volatility 50	15.7	15.4	79.9	89.1	2.7					2.0				

Parent indices considered are Nifty 100, Nifty 150 and Nifty Smallcap 50 (in equal proportion) for Nifty Low volatility 50; Nifty 100 for Nifty 100 Low volatility 30, and Nifty 500 for Nifty 500 Low volatility 50. Rolling returns data considered from April 1, 2005 to April 23, 2026. Outperformance margin shows how widely spread the factor's relative outperformance has been over time; Min shows widest underperformance; Max shows widest outperformance.

Owning superior businesses: Quality

Quality investing looks for fundamentally strong businesses: companies with high profitability, low debt and stable earnings. The thesis is simple. Well-run businesses should hold up better during market stress

and compound more steadily over time. It is also India's largest factor category with 27 funds, of which three are actively managed.

Unlike Momentum or Alpha, Quality's outperformance has been less decisive. It has outperformed

most consistently in the small-cap universe, beating the parent 96 per cent of the time across five-year windows. It similarly outdid the flexi-cap universe but the edge sharply weakens in large caps where strong businesses are already

The most crowded factor in Indian markets

[SPECIAL REPORT]

widely recognised.

Still as a satellite holding, Quality stands out for its median five-year rolling return of 14 per cent with one of the lowest volatility among all factor portfolios. It beat the pure flexi-cap portfolio nearly 94 per cent of the time. More importantly, it also provided the strongest downside cushion during difficult periods.

Where it fails is against the tougher benchmark of the flexi-cap plus mid-cap portfolio. Quality barely held its ground here outperforming only about half the time.

That reveals both its strength and limitation. Quality protects portfolios better during uncertain or falling markets but it can lag badly

when markets reward aggressive growth, cyclicals and mid- and small caps as they did post 2014, from when the factor's underperformance has coincided.

The verdict: Quality is a defensive factor and not necessarily a return enhancer. It works better as a portfolio stabiliser than as a return booster.

The final scorecard

We set out to answer a simple question: do factor funds improve a portfolio when used as a 30 per cent satellite allocation alongside an active flexi-cap fund? Some of them do.

To make the results easier to interpret, we mapped all five factor satellite portfolios into four quadrants based on two things: their median five-year return and risk, keeping the flexi-mid cap portfolio as the benchmark for comparison. The result is a surprisingly clear separation between the winners and the laggards.

High-risk, low-growth quadrant (Worst)

The 70:30 flexi-value portfolio lands here. This was the least rewarding trade-off in the analysis. Despite high volatility, the strategy failed to generate superior returns. It also struggled to meaningfully beat the flexi-cap plus mid-cap combination. The outperformance occurs in lumps, making it an unsteady satellite option.

Aggressive growth quadrant

This quadrant houses the 70:30 flexi-alpha and flexi-momentum

portfolios. Both strategies delivered strong return lift, particularly Momentum, which emerged as the best return booster. But those gains came with meaningfully higher volatility and deeper drawdowns.

These portfolios work best in one-way markets where leadership remains stable. When markets turn sideways or the trend changes abruptly, both strategies can struggle sharply and require a high tolerance for volatility.

Balanced risk-return quadrant

None of the factor portfolios landed

Five satellites, one clear pecking order

Momentum wins on returns, Quality on risk-adjusted outcome and Low Volatility on stability

Portfolio	5Y median return (% pa)	Std. deviation of 5Y returns (% pa)	Outperformance (% of time)		Worst Drawdown (%)
			vs 100% Flexicap	vs Flexicap+Midcap	
100% Flexi cap	12.9	5.0	—	—	-60.6
70% Flexi cap + 30% Mid cap	13.8	5.6	—	—	-63.5
70% Flexi cap + 30% Nifty Alpha 50	15.0	6.2	78.1	76.8	-67.2
70% Flexi cap + 30% Nifty 500 Momentum 50	15.5	5.8	96.5	93.1	-64.3
70% Flexi cap + 30% Nifty 500 Quality 50	14.0	4.9	93.8	50.7	-58.4
70% Flexi cap + 30% Nifty 500 Value 50	12.7	6.2	55.4	38.3	-62.5

The factor map

Quality and Low Volatility land in the best zone. Value sits in the worst

7.0 Standard deviation of 5-year return (%)

Based on five-year median rolling returns from April 1, 2006 to April 23, 2026. Risk is calculated as standard deviation of five-year rolling returns in the assessment period. Factor indices considered are Nifty Alpha 50, Nifty 500 Momentum 50, Nifty 500 Value 50, Nifty 500 Quality 50 and Nifty 500 Low Volatility 50. All total return indices are considered. For flexi-cap and mid-cap allocation, category median returns on daily basis for all active regular plans are considered.

here. The only occupant is the pure flexi-cap portfolio itself, which reinforces an important point: a diversified active portfolio with less risk and moderate returns still remains the cleanest all-weather core allocation.

Smart growth quadrant (Best)

This is where the 70:30 flexi-quality and flexi-low volatility portfolios sit. Both strategies delivered higher

returns than the pure flexi-cap and the flexi-mid cap portfolios while taking significantly lower risk.

Quality generated the strongest overall risk-adjusted outcome while Low Volatility delivered the smoothest return profile and the shallowest drawdowns. These were not the highest-returning portfolios. But they produced the most efficient trade-off between risk and reward.

That makes them the most practical factor satellites for

most investors.

The broader conclusion, however, remains unchanged. None of the factors earned the right to become a core holding. The benefit came from combining them with a diversified flexi-cap allocation, not replacing it.

Before you buy

A final note on what these numbers actually represent. This study is built on factor indices, not live fund returns. Indices operate in a frictionless world. They do not pay expense ratios, face liquidity constraints or deal with investor redemptions during drawdowns. Real funds do. Actual investor experience will almost certainly be weaker than what the index suggests.

There is also the issue of backtested history. Most factor funds in India were launched only between 2017 and 2020, while their historical data stretches much further back. Those returns are reconstructed retrospectively using today's methodology and therefore benefit from hindsight.

This does not invalidate the conclusions. But it does mean the numbers should be viewed with some caution. The broad ranking of factors in our analysis is reliable. The magnitude of outperformance may differ in the real world. ☑

[COVER STORY]

Your fund grew Did it change?

By Pranit Mathur

A young manager arrives at a fund house with a clear idea of what he wants to do. The fund he has been allocated has a few hundred crores under management. He picks 20 stocks he believes in deeply, sizes them aggressively, and lets the conviction run. The fund does well. Returns get noticed. Money begins to arrive. The fund crosses ₹1,000 crore, then ₹10,000 crore, then ₹50,000 crore. The investor who bought in early opens the latest factsheet and finds something curious: the fund now holds 130 stocks. Many of the names the manager once held with conviction are still there, but they sit alongside roughly 100 others the investor knows very little of. The largest position is no longer 8 per cent of the portfolio. It is 2 per cent.

The fund has the same name, the same manager, the same SEBI category. But it is no longer the same fund. This is happening, in some form, to most large active equity funds in India today. The country's largest active equity fund has crossed ₹1.25 lakh crore. The largest small-cap fund now manages over ₹60,000 crore. These numbers were unthinkable in the past. But in the past eight years, a seismic shift has happened.

The largest fund by size or assets under management has grown several times in every category. The leader of the diversified universe has accelerated away from the rest into a class of its own. See chart: *The age of giant funds*.

This kind of growth has been encouraging for AMCs but unsettling for the investor who bought in when a fund was small and aggressive and is now wondering whether they should continue to hold it. The worry is rational. A fund that once placed concentrated bets in a ₹8,000-crore vehicle cannot, by the simple physics of size, do the same thing in a fund eight times larger. And hence a simple question arises: does AUM size matter? Or in simple words, does a fund that has grown too big deliver less?

How we tested the giants

To answer that, this story tests the five largest funds by size in each of the large, mid, small and diversified category buckets on

The age of giant funds

Largest fund in each category has swelled beyond recognition

Diversified includes the following categories - flexi cap, large & mid cap, multi cap, value oriented and ELSS. Categorisation as per Value Research classification.

three critical dimensions. For context, the diversified bucket consisted of flexi-cap, large-and-mid-cap, multi-cap, value-oriented and ELSS funds as these categories largely invest in the same universe of stocks. The three dimensions were:

- First, **composition**: has the portfolio changed as the fund grew?
- Second, **mobility**: can the fund still buy and sell its holdings easily, or has size made it harder to move?
- Third, **outcome**: has any of this actually cost investors returns?

Together, these three tests show where to look for the real impact of size: first inside the portfolio, then in the fund's ability to move, and finally in the returns investors receive.

A note on our methodology

Importantly, the analysis considered the average of the five largest funds in each bucket so that no single fund speaks for the others. The time period considered was 2018 onwards because SEBI's 2017 categorisation rules took effect that year, requiring funds to stay within strict category limits.

Composition: How portfolios evolved with size

Three parameters answer that.

1. Number of securities. The first measure is the number of securities a fund holds. Stock

Casting wider nets

Securities count rose sharply in small-cap funds where the investable universe was shallow

Based on the average of the five largest funds per category. Categories are bucketed by each fund's investable universe.

count is one of the simplest signals of how a manager thinks about the portfolio: a tight, high-conviction book or a broad, diversified one. The chart *Casting wider nets* maps this out for each bucket.

The result is selective and for a reason. Where the fund manager has a broad investable universe, the stock count has stayed disciplined. Where that universe is narrow, like in small caps, the count has had to grow because there is nowhere else for the rising AUM to go.

2. Top 10 concentration. The more interesting question is whether these new positions came at the cost of the original conviction. Did fund managers, in the act of finding 50 new names to deploy capital into, also dilute their

The best ideas still dominate

Ten largest holdings of the largest funds still hold most weight

Based on the average of the five largest funds per category. Categories are bucketed by each fund's investable universe.

commitment to the names they started with?

The answer, surprisingly, is no. The weight of the top 10 holdings of the largest funds in every category has stayed broadly flat. See chart: *The best ideas still dominate*.

So even in categories where the stock count rose, the top holdings retained their weight. Fund managers are not abandoning their best ideas. They are preserving conviction at the head of the portfolio and adding a long tail behind it. The portfolios have grown wider but the head of each one still looks much the way it did.

3. Average market cap. That said, where those new positions have come from is itself revealing. The market cap-curve drift is most visible in the diversified universe but the rest of the buckets are not immune to it either. See charts under *The drift up the cap curve* together.

In the diversified universe, the largest funds are systematically holding stocks of materially higher average market cap than their category peers, and the gap has widened sharply over the last two years. The other categories show the same direction of drift, though at far smaller magnitudes. Even so, a small-cap fund that once held genuine small caps at ₹8,000 crore AUM cannot hold the same proportion at ₹60,000 crore. The math of scale does not allow it. The largest funds, therefore, find refuge in larger stocks while staying within the investable universe.

Mobility: Big funds move differently

A portfolio is only useful if the fund can build it and exit it easily. As AUM rises, every position becomes a larger share of the available daily liquidity in each stock. The question is how much room the fund actually has to move.

Liquidity map

See chart: *Where liquidity runs thin*. It reveals the overlooked half of the size story. Counting volumes across NSE and BSE combined, the average large-cap stock changed hands worth roughly ₹430 crore on a typical day in March 2026. The average mid-cap stock traded

The drift up the cap curve

The biggest funds across categories are inching toward larger stocks

Average m-cap of holdings (in ₹ lakh cr)

Large caps: Lifting ahead

Mid caps: Opening a gap

Small caps: Moving past

Diversified: Getting noticeably larger

Based on the average of the five largest funds per category. Categories are bucketed by each fund's investable universe.

around ₹160 crore, and the average small-cap stock around ₹85 crore.

Trading volumes have grown sharply across all three segments since 2019, and small-cap turnover has multiplied many times over. Even so, the gap between segments remains structural. Large-cap funds operate in the broadest and most liquid segment of the market; at their scale, daily flows barely move prices. Small-cap funds operate in a segment that has grown more liquid but remains far shallower than what the largest funds require.

Consider a ₹60,000-crore small-cap fund taking a 1 per cent position in a single small-cap stock. That is ₹600 crore of stock to buy in a name that has traded volumes worth around ₹83 crore on an average day over the past year. The fund cannot realistically be the entire buyer in the market for that stock. Even participating in a fifth of the daily volume, building that single 1 per cent position would take over seven weeks of patient buying.

This shows up in two problems. The first is when the fund is buying. A new high-conviction call is hard to build quickly without telegraphing the intent and risking some price impact. The second is when the fund is selling, and this is where the AMFI stress tests for mid- and small-cap funds, mandated since February 2024, become useful.

What stress tests reveal

The segments AMFI chose to cover are themselves telling. The stress-test requirement was not extended to large-cap funds. With the average large-cap stock trading nearly five times the volume of the average small-cap stock, large-cap funds do not face the same exit-time problem. The mid-cap and small-cap segments are different. A redemption shock there translates into a measurable timing constraint and that is what AMFI's disclosure is built to surface.

The stress test captures what the headlines often miss. See chart: Easy to enter, hard to leave. The small-cap category average sits in the mid-teens, meaning an average small-cap fund could exit half its book in roughly two weeks under normal conditions. Meanwhile,

the largest five small-cap funds, averaged, would currently take closer to two months to do the same.

The largest five mid-cap funds sit at around 23 days against a category average of eight days. The broader category remains well-positioned to handle redemptions in normal times. The biggest funds in each category simply operate on longer timelines, with less room to manoeuvre quickly if conditions tighten.

Outcome: Has size hurt returns yet?

So, the largest funds have clearly changed over the last few years. Their portfolios are wider, the market-cap mix has crept upwards, and they are operating with materially less liquidity headroom than they once did. The natural assumption with all this in hand would be that their alpha must have deteriorated by now. But that's not entirely the case.

The alpha surprise

Alpha, as used here, is the three-year risk-adjusted return of each fund relative to its TRI benchmark: BSE 100 TRI for large-cap funds, BSE Midcap 150 TRI for mid-cap funds, BSE Smallcap 150 TRI for small-cap funds, and BSE 500 TRI for diversified funds. It measures how much a fund has added over and above what the benchmark delivered, after accounting for the risk taken to get there.

See chart: *Alpha survives except in small caps*. It plots this three-year rolling alpha for the five largest funds in each of the four buckets and shows where rising AUM has hurt alpha.

In **large-cap funds**, alpha has hovered around zero for most of the period and ticked up to around 1.5 per cent recently. The line is essentially flat-ish. The size of the biggest large-cap funds has grown several times over the same window. If it were the binding constraint, the line would slope downward as AUM rose. It has not. The thin alpha here reflects a narrow universe of stocks and an increasingly efficient market, not a lack of liquidity.

Where liquidity runs thin

Small-cap stocks simply do not trade enough

Stocks in the BSE 100, BSE 150 mid-cap, and BSE 250 small-cap indices considered as proxies for large caps, mid caps, and small caps.

In **mid-cap funds**, alpha is more volatile but has averaged out flat across the period. The size of the largest mid-cap funds has roughly quadrupled over the same window. The trajectory has stayed range-bound through that rise.

In **diversified funds**, which now houses the largest active equity funds in the country, alpha has actually risen across the period, from near zero in 2018 to around 4.5 per cent by early 2026, measured against the BSE 500 TRI. Diversified funds are actually doing better as they have scaled.

Across these three categories, the AUM has multiplied several-fold and alpha has held its level. Size, for its impact on returns, has not

yet bitten. But small caps are the exception.

Where the cracks finally appear

From May 2018 through mid-2024, the largest five small-cap funds' alpha oscillated between roughly 3 and 8 per cent above the BSE Smallcap 150 TRI—the highest among the four categories. From mid-2024 onwards, it fell sharply. By early 2026, it sat close to 1 per cent.

The straightforward reading is that size has finally bitten the big small-cap funds. Their holdings have stretched, market-cap has favoured bigger stocks, and they now need closer to two months to exit half their books. All this as shown earlier suggests size's dampening effect on performance.

Fund managers themselves, however, would offer a different reason. Through the latter half of the 2024–25 rally, several of the largest small-cap funds chose to stay cautious about valuations and not ride the market mood fully. That call may yet prove right over a longer horizon but in the alpha analysis it shows up as underperformance.

The alpha can be seen dipping in mid-cap and diversified funds as well through the same window. The dip, therefore, was not small-cap-specific. Both readings carry weight. Some of the small-cap alpha drop is due to fund-manager judgement and the rally cycle, and should reverse as the cycle does. Some of it is

a result of the structural pressure of size and that is irreversible.

Why are small caps running out of room

The problem with small-cap funds is not just that they have become large. It is that the category, as a result, now already owns a meaningful chunk of the market it is supposed to invest in. This explains a part of the alpha compression.

A note on our methodology

To keep the comparison fair, we did not simply divide total category AUM by free float. Small-cap and mid-cap funds are allowed to invest 35 per cent of their money outside their home universe. So the accompanying chart counts only the AUM actually deployed within each category's mandated segment compared with the free-float market capitalisation of that segment, i.e., the respective indices.

See chart: *Owning the pond*. Small-cap funds now hold around 16 per cent of the investable small-cap universe, measured through the segment's free float. In September 2019, that number was around 8 per cent. Their ownership share has nearly doubled in five and a half years. No other category comes close.

Owning the pond

Small-cap funds now own a startling share of their investable universe

Stocks in the BSE 100, BSE 150 mid-cap, BSE 250 small-cap, and BSE 500 indices are considered as proxies for large-cap, mid-cap, small-cap, and diversified universes. *Category AUM refers to assets invested within the universe of the category only.

Large-cap funds own about 2.5 per cent of the top 100 stocks' free float. Mid-cap funds own around 9 per cent of their universe. Diversified funds own a similar share of the top 500 stocks. Small caps stand apart because mutual funds have become a much larger force in a much narrower market. This is where size starts becoming a constraint.

When small-cap funds collectively own roughly one rupee in every six available in the segment, the stocks one fund wants to buy are increasingly already owned by other funds. Fresh money entering the category is chasing a pool of stocks that has not expanded (in terms of volume) at the same pace. That naturally makes alpha harder to generate. That does not mean fund managers of the largest small-cap funds have suddenly become poor stock-pickers. It means their job has become structurally harder.

Large-cap and diversified funds do not face this pressure in the same way because their universe is much deeper. Mid-cap funds are beginning to feel the strain, but not at small-cap intensity. Small caps alone have been squeezed by their own popularity.

That is why the fall in small-cap alpha warrants more than just a performance review.

The point where size bites

A large fund is not automatically a bad fund. It is just that size matters only when the category itself starts running out of room.

For most investors, that is a reassuring finding. In flexi-cap, multi-cap, ELSS, value, large-and-mid-cap, large-cap and even mid-cap funds, AUM has risen sharply but alpha has broadly held up. These funds have changed in shape, but not yet in outcome.

However, that change in shape still matters. A portfolio holding 130 stocks will not behave like one holding 80. As funds become larger, they naturally become broader and slightly less aggressive. Investors should adjust their expectations accordingly. But the data does not support exiting these categories simply because a fund has become large.

Small caps are where the conclusion changes. Here, size has started leaving visible marks. Stock counts have expanded sharply. Liquidity has tightened. And alpha, after years of holding up, has started to show signs of compression.

That does not mean every large small-cap fund is broken. Nor does it mean investors should rush to sell. But it does mean small-cap investors should pay closer attention to what their fund is becoming.

Three questions now matter more than they once did:

- Has the fund's stock count risen consistently over the past few years and led to a reduction in high-conviction calls?
- Is the fund regularly sitting with its average market cap significantly above its peers?
- How far above does the fund regularly sit on the AMFI liquidity disclosure relative to its peers?

If the fund is comfortable on liquidation days and reasonably within the boundary on holdings, the structural pressure may still be manageable. But if the fund is stretched on all three, you may no longer be holding the nimble small-cap vehicle you originally signed up for. The important thing is this: the change did not happen suddenly. It was visible throughout: in the factsheets, portfolio disclosures and liquidity data. The real question now is not whether the fund became bigger. It is whether it still does the job you bought it for. ☒

Kotak Flexicap Fund

It invests flexibly across large, mid, and small cap stocks.

Trusted for *15+ years*

'The market is clearly far more attractive today'

How to stay the course and avoid panic in volatile markets

Twenty-seven years in equity markets teaches you one thing above all else: valuations always matter. Sailesh Raj Bhan, President and CIO – Equity Investments at Nippon India Mutual Fund, has spent those years building and refining a framework that has remained largely unchanged across cycles—buy quality businesses at sensible prices, choose risks deliberately and stay the course when the market disagrees.

Bhan oversees some of Nippon India's flagship strategies, including its large-cap and multi-cap funds. Both have delivered consistent long-term returns not by chasing growth at any price, but by refusing to pay for

it when the numbers do not justify it.

In a market that has spent the last 18 months consolidating, that discipline is what he keeps returning to. Twenty-seven years, he would say, have given him little reason to change it.

Your large-cap fund holds a five-star rating for nearly three years and leads the category over 10 years with nearly 16 per cent CAGR. What's the stock-picking framework behind those returns, and what's been the single biggest driver of alpha?

The good part about India as a market is that there is a lot of alpha available across large-, mid- and

small-cap categories. Interestingly, it comes down to how we approach the market, what risks we choose to take and which we choose to avoid. If we keep repeating this over many cycles, it eventually delivers the outcomes we all aim to achieve.

In the large-cap fund, over the years, our basic approach, which is common across the fund house as well, has been to respect valuations. We believe valuations are an extremely important part of portfolio construction because, over time, either mean reversion comes into play or you see disappointments in companies that were priced for perfection, often because the last couple of years were good. So,

respect for valuations, or what we internally call a 'growth at a reasonable price' approach, is central to how we construct portfolios.

Second, we believe that to generate returns in equities, you have to take risks. There are no excess returns over the index without taking some risk. The key is to choose the right risks, those that will pay off if you get them right. That selection of the right risk is driven by strong bottom-up research, supported by a significantly large and experienced research team. This ground-up approach helps us identify opportunities, take those calls and size them appropriately within the portfolio, while ensuring that we don't overpay for growth.

If you put these three elements together, respect for valuations, choosing the right risks and strong bottom-up research, it's essentially a framework that we've been consistently following. Over the last 2 decades, we have tried to repeat the simple tenet. The environment also plays a role in enabling returns. Over the last 10 years, markets have experienced several dislocations. For instance, around 2016-17, the market was extremely narrow, dominated by consumer companies, FMCGs and private-sector banks. In such a scenario, nearly 70-80 per cent of the market was very attractively priced, largely because near-term outlooks were not favourable. That gave us an opportunity to take the right risks, like moving into the largest PSU banks at the time, which were significantly undervalued compared to private-sector banks that were already pricing in growth.

So, markets do provide these opportunities, and it's about being willing to act on them. At the same time, our framework ensures that we don't throw good money after bad

Fund manager snapshot

valuations. The idea is to buy good growth companies, but at sensible prices whenever possible.

Because we've seen this repeatedly, if you overpay for growth, you can end up in a difficult position two or three years down the line when valuations normalise. In fact, we've seen that even recently. Over the last couple of years, markets have largely been flat, and that again reinforces the importance of disciplined portfolio construction.

Your multi-cap fund has grown from around 80 stocks to around 125 over five years, while turnover has dropped to the mid-20s. Was this a deliberate response to AUM growth, or did it emerge organically?

Our multi-cap fund has seen an increase in the number of stocks post categorisation changes by the regulator, streamlining mutual fund

categories. With those limits in place, you are effectively running three portfolios within one: large, mid and small caps. Earlier, the allocation range was more flexible, with around 40-60 per cent in large caps and the rest in mid and small caps. This fund has over 20 years of history, and we have operated within that flexibility over cycles. But once the regulation mandated a minimum of 25 per cent allocation to each category, you had to maintain a certain level of exposure to all three segments independently. That, in turn, led to the creation of three distinct sleeves within the same portfolio, thereby naturally increasing the number of holdings. Also, it's not the fund size that has led to the higher number of stocks. While there may be a reasonable number of tail holdings, there is still meaningful concentration. The top 30-50 stocks continue to drive a large part of the portfolio; if I recall correctly, the top 50 stocks account for nearly 70 per cent of the portfolio. As fund managers, we also need to manage liquidity prudently. So, you may have a larger number of small-cap stocks, relatively fewer mid caps and even fewer large-cap names in terms of count, within the overall construct.

Importantly, we don't believe that the tail drives returns. Returns are generated by our core bottom-up bets, stocks that we hold for three, five, even 10 years. That's where the real value creation comes from. On churn, turnover was lower earlier, but it has picked up slightly now. That's largely because markets are beginning to show dislocations, creating opportunities. In fact, churn was even lower two years ago. But over the last 12-18 months, with meaningful price corrections, we are seeing opportunities to reallocate capital to better-value, higher-

quality businesses.

Even then, the turnover remains at a very sensible level of around 20-25 per cent, which is quite normal for equity investing. At its core, the framework remains simple: buy quality businesses through bottom-up research at sensible prices. It's the same growth-at-a-reasonable-price philosophy. And then stay invested as long as the business can deliver a 12-15 per cent IRR over a long timeframe. Beyond that, if requirements shift or better opportunities emerge, we act accordingly.

Is the terminal risk to Indian IT as serious as the market believes? And after the derating, do you find IT stocks attractive now, or would you wait for more clarity?

Nobody really knows how the final outcome will play out over the next few years. But based on where we stand today, and what AI has delivered so far, yes, there could be some long-term risks to terminal value. That said, these companies are not static; they evolve. Like people, they will adapt, reinvent themselves and find ways to remain relevant.

The more important question is: What are you paying for? If you are buying these businesses at, say, a 6-7 per cent earnings yield and they are generating ₹10,000-20,000 crore in cash flows, the risk-reward starts turning in your favour quite meaningfully. At those valuations, you are largely paying for the current business and not for an aggressive future. In that sense, the market is not pricing in excess optimism; rather, it is factoring in significant risk. The AI narrative today is creating value in some parts of the market while leading to perceived disruption in IT services. That, in turn, is allowing you to buy these

companies at better prices. Now, to say that these businesses may not exist five years down the line, that would have far-reaching implications across sectors and industries, not just IT. If that were the base case, many other market segments would also be at risk, yet they are trading at much higher valuations.

Also, look at the balance sheets. These are companies with cash of ₹20,000-50,000 crore. If they are unable to navigate change, a large part of corporate India would face challenges, as most companies don't have the financial strength, talent or adaptability to do so. So, in all probability, valuations today are in favour of investors. Historically, new technologies come with strong narratives, but real-world adoption takes time. For instance, GPS was talked about in the late 1990s, but widespread usage only picked up around 2010. There is usually a lag between promise and actual impact. AI may move faster given the scale of investment, but even then, companies will need to build practical use cases and solutions on top of this infrastructure. So, to my mind, current valuations are probably overestimating rather than underestimating risk.

Markets have largely consolidated over 18 months, with valuations moderating from around 19x to around 21x after the recent rebound. Is the market fairly valued, or is there room for further correction? Where do you see clear overvaluation or undervaluation today?

There has been a meaningful time correction in the market, and in several pockets, a price correction as well. So it's really been a combination of time and price corrections that have played out.

Compared to where we were two years ago, the market is clearly far more attractive today. Even within this period, a lot of things have evolved, including policy support such as GST-related measures, income tax changes and an improving earnings outlook. Before the recent geopolitical disruptions, we were looking at early double-digit earnings growth.

If you look at the market at around 18-19x earnings, and if the economy can deliver 13-15 per cent earnings growth over a sustained 5-10-15-year period, these are fairly attractive levels. Importantly, there has been enough derating and a fair bit of negative news, whether it is geopolitical tensions, energy-related concerns or FII selling. In a way, that is healthy because it creates better entry points. Overall, valuations today look reasonably sensible, and enough opportunities are emerging.

On sectors, what is interesting is that you are now getting high-quality, well-established companies that have not delivered returns for 5-7 years at reasonable valuations. These include parts of private sector banks, consumer companies and NBFCs. These are businesses with strong franchises unlikely to be disrupted in the near term. Structural shifts in such sectors take 10-20 years, not three to five years. However, due to heavy FII ownership, they have borne the brunt of recent selling, especially in the last few months.

That has created attractive opportunities in large, high-quality names such as private sector banks, utilities (especially power utilities) and even pharma, where valuations are becoming more reasonable.

IT services, as we discussed earlier, are another pocket where valuations have corrected meaningfully. Consumer names, too,

are starting to look interesting, largely because near-term growth expectations have softened, and sentiment has turned cautious.

The good part of the recent correction, especially since November, is that it has been broad-based. Earlier, we were in a market where valuations were elevated across sectors. Now, we are seeing dispersion, with different sectors correcting at different paces, creating opportunities to selectively

equity products, and we would not want to run them like multi-asset funds. If an investor is looking for a multi-asset approach, there are dedicated products for that. So, within the available flexibility and as long as it does not alter the fundamental character of the equity product, we may selectively use these options. But the primary driver of returns will be equities, and we would stay true to that mandate.

to communicate clearly why we are taking that stance.

For instance, owning cyclicals around 2016-19 was not easy, but those were the very segments that eventually delivered 10x-20x outcomes.

The reality is, alpha is not free. It comes from taking the right risks. So the key is to identify those risks, communicate them and stay disciplined.

At the same time, we are careful not to take extreme or outlier risks. Investor experience matters. If volatility becomes too high and investors exit prematurely, outcomes can suffer regardless of the strategy. So, we define our risk boundaries clearly, what risks we will take, what we will avoid and where we are willing to deviate. A significant part of our effort then goes into research and stock selection, and importantly, staying the course. There will always be phases where certain styles outperform. For example, there were periods when 'growth at any price' worked, while 'growth at a reasonable price' underperformed. It is tempting to shift, but if you keep changing your approach, you end up creating bigger challenges later. So, consistency and communication are critical.

Investors also understand that there is no easy money in markets. Different strategies will work at different times. Internally, we focus on what we call sustainable alpha, which is whether we can generate excess returns in a repeatable, disciplined manner over long periods, rather than chasing short-term outperformance. Over time, that approach builds trust, and that's what allows investors to stay the course with you. ☑

A large section of our investors has stayed with us across cycles. Over time, they begin to understand the framework we follow. Our approach is simple: we try to say what we do and do what we say.

allocate. So, in summary, this is no longer a market where everything is expensive. It's a market where stock and sector selection are increasingly important.

SEBI now allows funds to hold alternate asset classes in residual portfolios. Will Nippon use that flexibility to dynamically cushion downturns or stay true to the fund's mandate?

Yes, the framework does allow for additional asset classes within equity portfolios, such as REITs, and now even gold has been discussed. There is always a possibility of allocating a small portion of the portfolio to such segments, especially if they offer attractive opportunities at a given point in time. However, the core of the portfolio will remain equities. These are designed as

You've spoken about being a contrarian investor, buying when others are pessimistic and avoiding crowded trades. How do you execute that at a fund level, where investors track performance constantly, and keep them aligned with your strategy?

That's a very important point. Thankfully, a large section of our investors has stayed with us across cycles. Over time, they begin to understand the framework we follow.

Our approach is simple: we try to say what we do and do what we say. That consistency helps attract investors focused on long-term wealth creation and willing to stay invested through different market phases. Even during difficult periods, when certain segments are underperforming, and we may be overweight there, we make it a point

‘Investing is a marathon, not a sprint’

Why flat SIP returns, defensive bets and dry powder are all part of the same long game

Dinesh Balachandran thinks of investing as a marathon, and he has the credentials to pace one. Head of Investments at SBI Mutual Fund, Balachandran brings over 22 years of experience spanning two continents, beginning his career as a structured finance analyst at Fidelity in Boston before returning to India and joining SBI Funds Management in 2012. An IIT Mumbai and MIT alumnus and CFA charterholder, he manages the Contra Fund, the largest in its category by some distance, alongside multi-asset and balanced advantage strategies.

In this conversation, he explains why playing defence can be the most offensive move and why investors sitting on flat SIP returns have little reason to panic.

The Contra Fund's long-term record is among the best in the business, yet the short-term picture is uncomfortable. What is driving this underperformance, and how do you see it?

You are absolutely right to highlight the contrast between short-term and long-term performance. When I think about it, at least personally, investing is a marathon, not a sprint.

When you think about investing as a marathon, you encounter different phases. There will be phases where you want to go on the offensive, where you try to accelerate, take advantage of timing and perform

well. And there will be phases where you need to slow down and conserve energy, because otherwise you may not reach the finish line.

Similarly, in investing, market conditions are not always the same. There are phases where markets offer a wealth of opportunities, and the key question is whether you are willing to maintain an independent thought process. If yes, then opportunities are abundant and you want to take full advantage of them. If I go back a few years, say, 2020, 2021 and 2022, that was clearly a period where opportunities were plentiful, and we wanted to capitalise on them. On the other hand, if I look at 2024, particularly from the middle of the year, it felt like we were at the other end of the spectrum. Everything appeared priced to perfection. Whether large caps or small caps, there seemed to be very few attractive opportunities.

In such a scenario, the

natural response was to play defence.

What did that mean in practice? First, we decided to maintain a much higher-than-normal cash allocation. We did not want to be forced into stock selection when we were not fully convinced, either from an earnings growth perspective or a valuation standpoint. Second, we used index futures. You can only hold so much cash, given that our framework allows a maximum of 15 per cent cash, meaning at least 85 per cent equity exposure is required. So we bought index futures as generic placeholders. The idea was that until we found individual stocks that looked attractive, we would maintain broad market exposure and wait patiently. Third, we moved towards so-called defensive sectors, which tend to hold value better during uncertain times. Historically, if you are concerned about a potential market correction, certain sectors have shown greater resilience.

This was essentially our approach in the Contra Fund roughly two years ago. Looking at the last two years, markets have not done much. So while cash led to phases of outperformance and underperformance on a point-to-point basis, overall it did not make a significant difference, but it did help reduce portfolio volatility.

What really hurt the fund was our allocation to defensive sectors. Traditionally, in our markets, defensive sectors include consumer goods, IT and healthcare. To that, I would also add private banking, which has historically held up well.

However, over the last 18 months, these sectors, particularly consumer goods, IT and private banks, have underperformed the broader market, even though the overall market itself has not done much.

This is where our portfolio strategy

did not work as expected. Some of the FMCG names, IT stocks and private banks that we increased exposure to, after earlier being underweight, did not contribute positively. As a result, fund performance has been below what I would have liked.

That said, in the broader context, this approach was about playing defence and keeping dry powder, which, in turn, allows us to be aggressive when the right opportunities emerge.

Even today, we have sufficient dry powder that we can deploy when opportunities arise. If I think about what happened last month, markets corrected due to easing tensions in the Middle East and some opportunities did emerge. However, the reversal was very quick. While we did deploy some capital, we couldn't do so in size. But that's okay. At the end of the day, if we get most of our calls right, a few mistakes here and

there will not matter much. Over the last 15 months, we have made some mistakes, but you learn from them and move on. That is how I look at it.

Both your equity funds at SBI carry active cash positions. Is this a house-level strategy, or a call you make independently?

This is definitely not a house strategy. It is more specific to me and my approach. The thought process here is that we are not actively trying to time the market. That is not the intent. While, in some sense, market timing does come into play in our asset allocation funds, where there is an explicit objective of determining the optimal asset mix, in pure equity funds, that is not the endeavour.

The primary goal is to identify good stocks to buy. The challenge, however, lies in defining what constitutes a good investment. We typically evaluate opportunities through the lens of owning quality businesses. You obviously do not want poor businesses, but at the same time, you do not want to overpay. So the real question is: how do you balance the two?

At that point, we were struggling to find enough ideas that met our criteria. That naturally led us to hold a higher cash position, because we did not want to be forced into buying something simply because there were inflows. We did not want to deploy capital for the sake of it. That was the core idea behind maintaining cash.

Your Contra Fund is underweight in Capital Goods and Financial Services, and overweight in Energy and Healthcare relative to the BSE 500. What is the reasoning behind these tilts.

Healthcare is a very interesting space because of the sheer heterogeneity within it. You are no longer just

talking about US-focused pharma companies; you have domestic pharma players, CDMO companies, biosimilars, oral solid generics and even hospitals. There are multiple sub-segments, which makes it a rich opportunity set.

When I look at our healthcare exposure in the fund, it is largely driven by bottom-up opportunities. We are not trying to play the sector per se; instead, we are identifying specific companies that look attractive. Inherently, in the Contra Fund, we are drawn to businesses that have underlying strengths but may have gone through a difficult phase. The key is to identify a potential catalyst for turnaround and then take a position based on that thesis. That is something we have been able to find in the healthcare space. Additionally, from a macro standpoint, if you believe the currency is likely to weaken, healthcare, particularly pharma, tends to perform well, which adds to its defensive appeal.

On oil and gas, we see it as a compelling value sector. There are companies in this space, many of them quasi-monopolies and largely public sector enterprises, that are available at attractive valuations. One broader macro view I have been operating with is that hard-asset businesses are likely to become more valuable over this decade. Several oil and gas companies fit that framework well.

We have taken diversified exposure across the value chain, not just upstream, but also downstream, and across both oil and gas segments. Some of these positions have helped the fund, especially during the Middle East tensions, while others have not, particularly where there were cash flow-related concerns. But overall, it remains a

space we find interesting, and we continue to maintain a positive stance. On Financial Services, this used to be an even larger underweight for us earlier. However, starting about two years ago, we began increasing our exposure, especially to private banks, and moved closer to a neutral position. After the recent de-rating, which was more pronounced than I had anticipated, we are actually looking to increase our exposure further. Valuations are becoming attractive. Yes, near-term uncertainties, including geopolitical risks like tensions in the Middle East, can impact the sector, as banking tends to be sensitive to such developments. But we prefer to look beyond near-term volatility and build exposure from a medium- to long-term perspective. As for Capital Goods, this has been an interesting journey. If I go back a few years, the Capital Goods sector contributed significantly to alpha across many of my funds. However, valuations eventually became very stretched, to a point where we found them difficult to justify, and we turned significantly underweight. That call hurt us for a while. Initially, we appeared right when the sector saw some de-rating, but subsequently, many of these stocks became even more expensive. So it is not an easy space to navigate.

That said, as you pointed out earlier, we are not momentum chasers. Just because we are underweight and it is hurting performance does not mean we will blindly buy into the sector. Unless valuations and fundamentals justify it, we are unlikely to change our positioning meaningfully.

At ₹43,754 crore, the Contra Fund is the largest of its kind in India by a wide margin. What is

the minimum free float and market cap you will accept for a sizable allocation, enough to enter without moving the price and exit without getting trapped?

You are absolutely right. The opportunity set is always a function of fund size. As AUM increases, it is only logical that the opportunity set narrows. Even over the past year, there have been opportunities that I could capitalise on in the Multi Asset Allocation Fund, simply because it is smaller and the equity component is even more limited. Those same opportunities are not always feasible in the Contra Fund.

So yes, as AUM has grown, the opportunity set has definitely narrowed. I cannot deny that. The real question, however, is whether at the current AUM I can still make a meaningful case, to myself first, that I can outperform the benchmark. And I believe the answer is yes.

While the opportunity set has become more constrained, and therefore the alpha potential may not be as high as before, I still think there is enough room to generate outperformance. If that does not happen, it would reflect my inability to capitalise on available opportunities rather than a constraint imposed purely by fund size. Now, if the fund were to double from here, all else remaining equal, it would certainly become a more meaningful challenge. But at current levels, I believe generating alpha is still achievable, though, admittedly, the magnitude of alpha may be lower than in the past.

The top names in your Flexicap Fund are private banks. Yet you made a case in November for PSU banks finally delivering earnings strength without heavy credit costs. Why does the

portfolio still lean private?

Part of this is a function of where we started, and I have realised over time that catching the exact bottom of a sector or stock is not always the most important thing. If I look at the PSU banking space, we were significantly overweight when the sector bottomed out. The idea was to play the corporate NPA cycle peaking and then normalising. To that extent, PSU banks were a meaningful contributor to portfolio alpha.

However, when you enter very

towards increasing exposure to private banks. Over the past one to one-and-a-half years, this shift has not worked in our favour. PSU banks have continued to perform well, while private banks have lagged, partly due to stock-specific issues and execution challenges. But our approach is always anchored in risk-reward rather than trying to predict short-term outcomes. We are not betting on a specific scenario playing out. Instead, we focus on where the margin of safety lies. At this point, we

sufficiently attractive for us to turn very aggressive on equities. At least from our framework, that has been the case. In 2024, we turned quite conservative. In our asset allocation fund, the model was indicating an equity allocation of around 20 per cent within a 0-100 per cent range. As a fund manager, I typically have a leeway of about 10 per cent around the model, and since we could still identify some reasonable stock-specific opportunities, we were positioned at around 28-29 per cent. That was the lowest equity allocation we have had. Today, in the Balanced Advantage Fund, we are at roughly 53 per cent. So we have moved from around 30 per cent to about 53-54 per cent. Now, why has it not gone up to 80 per cent or 90 per cent? I would be happy to do that, and we do have the flexibility to take equity exposure that high. But market conditions need to justify such a move.

Even last month, when markets corrected, our framework suggested that valuations had only reverted to slightly below long-term averages. Sentiment had cooled from euphoric levels to slightly below neutral. Earnings downgrades seemed largely behind us, but we were not seeing any meaningful earnings upgrades either. Putting all of this together, the framework indicated that while we should move away from a very conservative stance and become more neutral, it did not warrant going all-in on equities.

So ultimately, it is a function of what the market is offering. I would be comfortable being more aggressive when the setup justifies it. But in our assessment, those conditions have not yet emerged, which is why the allocation range has remained narrower than what one might ideally expect from a fully dynamic strategy. 

“ PSU banks have continued to perform well, while private banks have lagged. At this point, we believe the margin of safety is better in private banks. That is why we continue to lean in that direction. ”

early in a cycle and generate strong returns, you also become mindful of the risks that tend to follow. Historically, PSU banks have been quite cyclical; periods of strong performance are often followed by weaker phases.

We had set clear objectives when we invested in PSU banks. One was that credit costs, which were above 2 per cent for many banks, should normalise closer to zero. The second was that valuations should improve to around 1x price-to-book. These were the milestones we were tracking.

Once these objectives were achieved, and in fact, performance exceeded our expectations, we reassessed the opportunity. At the same time, private banks had seen a meaningful de-rating relative to their historical averages.

So from a risk-reward perspective, it made sense to gradually reduce our overweight in PSU banks and move

believe the margin of safety is better in private banks. That is why we continue to lean in that direction even though, in the near term, it has not played out as expected.

Your MAAF and BAF both permit wide dynamic allocation, yet net equity has stayed in a roughly 35-55 per cent band, with a steady gold and silver allocation in the MAAF. Why hold back from the full range you are permitted?

That is a fair observation. Ideally, dynamic asset allocation funds should operate across a much wider range. However, we are guided by a structured framework for these hybrid funds. For instance, in the Balanced Advantage Fund, we follow an asset allocation model that incorporates valuations, sentiment and the near-term earnings outlook.

If I look at the past three years, valuations have never become

[CATEGORY REVIEW]

Thematic: Consumption

A mutual fund category built around a simple macro truth: as India grows richer, the companies selling to its consumers tend to grow with it.

SEBI mandate: Invest at least 80 per cent of money in stocks belonging to consumption theme

Final verdict

Rising financial awareness and easier access have brought crores of new investors into the market. Companies linked to the capital markets ecosystem, represented by this index, have been key beneficiaries. Strong fundamentals and growth prospects have

driven a sharp rally, but valuations now appear stretched, suggesting much of the optimism may already be priced in.

For investors, this theme is best approached as a satellite allocation, with the core anchored in diversified categories.

Have three index funds? Look closer

It might just be one fund in disguise

Passive investing has earned its stripes. It is simple, low cost and free of worries about fund manager discretion. You simply buy the index, stay invested and let the market do its job.

But there is a big problem investors building passive portfolios tend to overlook. As more index funds become available, many assume that owning more of them automatically means better diversification. That feels sensible at first. A Nifty 50 fund gives you 50 stocks. A Nifty 500 fund gives you 500. A Nifty Total Market fund gives you 750. So adding them together should spread your money wider. That, however, is not the case. Even though these broad indices substantially differ in the number of their holdings, they still suffer from a serious overlap that makes them more similar than different. Here's how:

Bigger indices, same anchors

Due to being weighted by market capitalisation, most broad indices end up being heavily tilted towards large-cap stocks. On a market-cap weightage basis, the bigger the company is, the larger the weight it takes in an index. So in any broad market index, the larger stocks have bigger weightage and thus bigger influence on its performance. This is why the Nifty 200, despite having 100 mid-cap stocks, had an average large-cap weightage of 82 per cent in the 12 months through March 2026.

Even the Nifty 500 and the Nifty Total Market indices, which majorly include mid- and small-cap stocks, remain largely influenced by the top 100 companies with large caps making up the bulk of their weight. See chart: *Breadth on paper, heft at the top*. So even though the number of stocks increases as you go broader, most of your money in effect still gets invested in the same large companies.

The diversification mirage

If broad indices are all tilted towards the same large companies, owning a variety of them does not

diversify your portfolio. It simply duplicates it.

Consider an investor holding both the Nifty 200 and the Nifty Total Market index. At first glance, this seems reasonable. The Total Market index has 750 stocks so this means there are 550 stocks that are not in the Nifty 200.

Aprajita Anushree/AI-generated Image

Breadth on paper, heft at the top

Broader indices have more stocks but their weight is dominated by large caps

Data as of March 31, 2026, based on the average market-cap allocation over the preceding 12 months.

But these extra stocks carry very little weight. The Total Market index still derives about 83 per cent of its weight from the same 200 stocks already covered by the Nifty 200. In other words, there is an 83 per cent overlap between the two. So the investor has two

Overlap in disguise

Most broad indices duplicate more than they diversify

Index	Portfolio overlap (%)				
	Nifty 50	Nifty 100	Nifty 200	Nifty 500	Nifty Total Market
Nifty 50	-	83.2	68.3	59.1	57.0
Nifty 100	83.2	-	82.1	71.1	68.5
Nifty 200	68.3	82.1	-	86.3	83.2
Nifty 500	59.1	71.1	86.3	-	96.3
Nifty Total Market	57.0	68.5	83.2	96.3	-

Data as of March 31, 2026, based on the average market cap allocation over the preceding 12 months.

indices without any meaningfully different exposure. It is the same portfolio with a thin layer of extras. This pattern shows up across all other combinations too. The indices change. The underlying exposure barely does. See chart: *Overlap in disguise*

The return gap stays narrow

One could still argue that even a small non-overlapping portion may improve returns over time. So that was tested next. Assume a monthly SIP of ₹10,000 starting in January 2006, invested separately in each of the broad indices and tracked until April 21, 2026. The results are unsurprising.

The Nifty 50 delivered an annual SIP return (calculated as XIRR) of 12.03 per cent. The Nifty 100, Nifty 200, Nifty 500 and Nifty Total Market clustered in a narrow range above that. The difference between most of them was less than one percentage point. So the number of stocks increased sharply but the return experience did not. See chart: *Returns that barely drift apart*.

The same pattern holds when indices are combined. A 50:50 split between the Nifty 50 and the Nifty Total Market, the pair with the lowest overlap among those tested at 57 per cent, delivered 12.56 per cent. That is just about 0.5 percentage point higher than the Nifty 50 alone. Even combining all five indices produced a return of 12.61 per cent per annum, not materially different from any other set. So adding more of these indices still gives almost the same outcome. See chart: *More isn't always better*.

What should you do then?

Start by having clarity on what you want to achieve

Returns that barely drift apart

Across indices, SIP outcomes remain in a narrow band

Index	Investment (₹ lakh)	Final corpus (₹ cr)	SIP return (%)
Nifty 50	24.4	0.96	12.03
Nifty 100		1.01	12.41
Nifty 200		1.04	12.66
Nifty 500		1.06	12.84
Nifty Total Market		1.09	13.04

Based on a ₹10,000 monthly SIP starting January 2006 in each index separately; final corpus as of April 21, 2026. Total Return Index (TRI) used.

More isn't always better

More indices fail to move returns meaningfully

Index combination	Investment (₹ lakh)	Final corpus (₹ cr)	SIP return (%)
Nifty 50 + Nifty 500	24.4	1.01	12.45
Nifty 50 + Nifty Total Market		1.02	12.56
Nifty 200 + Nifty 500		1.05	12.75
Nifty 50 + Nifty 200 + Nifty 500		1.02	12.52
All five indices		1.03	12.61

Based on a ₹10,000 monthly SIP split evenly across indices starting January 2006; final corpus as of April 21, 2026. Total Return Index (TRI) used.

before picking funds. If you want a simple, low-risk passive portfolio, a single large-cap index fund can be enough. If you want one fund with broader market exposure, a Nifty 500 index fund is a good option. It will be large-cap heavy but still offer decent exposure to mid- and small caps in a single place.

But if you want meaningful diversification beyond large caps, consider equal-weight indices instead of market-cap weighted ones. They spread money more evenly across stocks. The Nifty 500 Equal Weight index, for instance, has roughly 20 per cent weight in large caps, 30 per cent in mid caps and nearly 50 per cent in small caps. Pairing it with the Nifty 50 brings the overlap down to around 10 per cent from 59 per cent when paired with the market-cap weighted Nifty 500.

This is the true test. Not how many index funds you own but how much of your portfolio they actually change. If the answer is very little, you have not diversified. Every index fund therefore must earn its place in your portfolio. If it does not bring fresh exposure, it does not belong there. ☒

Data for direct plans as of April 30, 2026; portfolio data as of March 31, 2026. The scoreboard includes the top 150 equity index funds by AUM. Risk Grade measures a fund's downside volatility against a risk-free return. Based on underperformance, funds are rated: High (Top 10%), +Avg (Next 22.5%), Average (Middle 35%), -Avg (Next 22.5%), and Low (Bottom 10%). NR = Not rated.

Data as of April 30, 2026; portfolio-related data as of March 31, 2026. The scoreboard features the top 150 ETFs by AUM, excluding debt ETFs. Performance figures are based on market price, not NAV. Premium/(discount) shows the average difference between the ETF's price and NAV over the past year. Tracking error reflects how closely the ETF has matched its benchmark returns. Liquidity is indicated by an icon next to AUM, based on average daily trading volume (ADTV): 😊 High – above ₹1 crore | 😊 Moderate – ₹10 lakh to ₹1 crore | 😊 Low – below ₹10 lakh.

NIRMAY CHOKSI

Process before performance

How a disciplined investment process drives sustainable outcomes

Every recipe exists for the same reason: consistent output. Not because the cook lacks talent, but because talent alone does not scale. The same logic applies to heart surgery, aircraft maintenance and, fund management also. Without process, you are not investing. You are improvising. In an AMC, process is required across every function: compliance, operations, risk, fund accounting. But it is most consequential in investment and research, where capital allocation decisions originate. That is where investors feel the difference between discipline and discretion.

Why process is the upstream guarantee

An investment process is the structured, repeatable steps that take an AMC from data to research to portfolio decisions. It is also the

Behavioural biases like overconfidence and recency bias erode returns in discretionary frameworks

definition of fiduciary duty: acting in investor's best interest, not fund manager's convenience. Most investors measure fiduciary care through returns. That's the wrong meter. Returns are an output. Process is the input that determines their quality and consistency.

Consider two fund managers: same market, same data. One builds a portfolio based on a defined rulebook. The other, on gut-feeling and discretion. On any day, results look similar. Over a decade, the divergence is structural. Process removes the two biggest threats to investment outcomes: human bias and inconsistency. Behavioural biases like overconfidence, recency, and herding erode returns in discretionary frameworks because even experienced investors are susceptible to them. A defined process designs them out rather than managing them.

The architecture of discipline

Six steps that filter every portfolio NJ AMC builds

NJ AMC's six-step investment process

Step 1: Data validation, verification and cleansing.

Data is the raw material. Its quality determines everything downstream. NJ AMC subjects third-party data to a three-stage audit: validate the source, verify consistency across providers and cleanse for errors and outliers.

Step 2: Development of factor parameters and hygiene check.

Clean data feeds into factor parameters, the lenses for evaluating stocks. NJ AMC customises metrics like ROCE, ROE and free cash flow rather than using off-the-shelf values. Even a standard measure like ROE can be computed multiple ways, each producing different backtests. Every parameter undergoes a hygiene check before entering NJ AMC's Parameter Library.

Step 3: Parameter robustness testing. While new ideas lead to new parameters, not all earn a place in portfolio construction. A standardised robustness testing process separates the strong from the weak. The logic is straightforward. If a parameter is genuinely robust, the stocks it ranks highest should outperform the middle-ranked stocks, which should outperform the worst-ranked, in both return and risk. To test this, the universe is divided into equal slices holding stocks of similar rank. A robust parameter behaves predictably: the top slice beats the middle, the middle beats the bottom and volatility rises as rank falls. NJ AMC's SmartBeta Research Platform applies this test across more than 1,200 companies and 20 years of data. Only parameters

By removing human bias, NJ AMC fulfils its fiduciary commitment through process

that pass are promoted for portfolio construction.

Step 4: Idea generation and portfolio construction.

With validated parameters, the research team builds not one but thousands of portfolio variants across four key construction decisions: universe selection, stock selection, portfolio allocation methodology and rebalancing frequency. Quantitative creativity operates here, but within structured, testable discipline.

Step 5: Analysis of the portfolio strategy. Every model portfolio is subjected to three layers of scrutiny across nearly 20 years of data spanning multiple market cycles. Performance analysis covers metrics such as CAGR, Sharpe ratio, maximum drawdown and rolling returns, examined over overlapping and non-overlapping periods. Attribution analysis identifies where returns came from. Churn analysis measures portfolio turnover, because high churn raises transaction costs and erodes strong strategies.

Step 6: Model finalisation and implementation.

The research team presents findings to an independent Investment Committee, which evaluates research rigour, risk-return potential, implementation feasibility and model suitability. Only strategies that clear this gate are approved for deployment. A pre-deployment liquidity analysis ensures execution at scale without meaningful market impact.

What this means for the investor

Process is not an internal operational footnote. It is a promise. It means decisions are data-driven rather than emotional, consistent across teams, true-to-label through market cycles and transparent enough to be audited and explained.

The edge that scales

By removing human bias and subjecting every decision to a structured, repeatable framework, NJ AMC fulfils its fiduciary commitment through process, because ultimately, the long-term success of any investment strategy is directly proportional to the strength and resilience of the investment process. 

Nirmay Choksi is the Executive Director - Research at NJ Asset Management Private Limited. The views expressed above are his own.

Separating wheat from chaff

A robust parameter sorts stocks cleanly

Source: Internal Research, CMIE, NJ AMC's Smartbeta Research Platform. Data is for the period September 30, 2006 to March 31, 2026. ROE Top, Middle and Bottom Tercile Portfolios represent the Top 33%, Middle 33% and Bottom 34% stocks, respectively, based on the ROE parameter. Past performance may or may not be sustained in the future and is not an indication of future return.

SHYAMALI BASU

Stay in the lane

Shortcuts in traffic and investing usually make things worse

Illustration: ANAND KUMAR

I had planned to visit a friend for a cup of coffee. We fixed a mutually convenient time, checked Google Maps, and both calculated when to leave. The app showed 55 minutes, a normal commute in Mumbai, where the distance between two points matters far less than the time it takes to cover it.

I left office promptly, having earned a reputation for punctuality, with a cushion of a couple of minutes built in. A short distance later, traffic came to a halt.

My driver waited, assuming it was a routine signal delay. Five minutes passed. The car did not move. We both rechecked Google Maps. It showed a 10-minute jam and added only a couple of minutes to the estimated arrival. I was still calm. I had my cushion. I went back to reading an article on my phone.

My driver was less composed. He stepped out of the car and asked a few passersby what had happened. Each one had a different version—an accident, a mob, a police van.

Most of us start an SIP with confidence. Then the market slows, and we wonder whether we took the wrong route entirely.

Frustrated, he tried to negotiate his way into an alternate route. By the time he managed to manoeuvre the car, the alternate route was worse than the one we had left. We arrived an hour late. My friend was on her second cup of coffee. The meeting, however, was well worth the wait.

I have been thinking about that evening in the context of investors today.

Most of us start a SIP with the confidence of someone who has just checked Google Maps. The calculator shows a number, a timeline, a destination. We leave on time. Then the market slows. The delay stretches. The monthly statement valuation goes up and down. And we start wondering whether we took the wrong route entirely.

Was SIP the right choice? Should we have invested differently? The reasons for the delay seem to vary, but the feeling is the same. No progress. No clarity. Each fund manager has a different picture just like the passersby.

I have read a fair amount on this question. Several papers argue that lumpsum investing, for all its volatility, can deliver higher returns than SIPs in rising markets. That is not wrong. Lumpsums work well when markets are going up. SIPs work better in flat or falling markets, because they reduce volatility and keep investors from being devastated by the swings.

But there is a more practical problem with waiting for the right moment to invest a lumpsum. Most retail investors are not fund managers with the discipline to hold cash and deploy it at precisely the right time. When money sits in a bank account, it tends to get spent. And timing the market successfully, consistently, is something no one has yet managed to claim.

The Pareto Principle applies here as it does everywhere else. The bulk of equity returns come on a small number of days. A strategy that keeps you invested through the flat stretches, accumulating quietly, at least ensures you are present when the upswing arrives.

No Excel simulation is accurate to the last

decimal. Unforeseen events happen. They can delay the destination by a year or two, sometimes more. But getting out of the car to explore alternate routes when you are already stuck in traffic is rarely the answer. Most of the time, it makes things worse.

The key is to stay at it. Even arriving late is better than getting lost. ☑

“ No one has yet discovered any other formula for investing which can be used with so much confidence of ultimate success, regardless of what may happen to security prices, as dollar cost averaging.

-Benjamin Graham

Shyamali has been navigating the asset management world for over 20 years, working with everyone from the seasoned super wealthy to absolute beginners. She has a knack for understanding the human side of investing and empathising with investors, something that shines through in her writing.

The cost of growing up

Three milestones, a long horizon and one mistake that costs a crore

By Siddhant Madhav Joshi

Abhijeet Prabhakar is 32. His daughter Ananya turned one a few months ago. He wants to fund three milestones for her: an undergraduate degree at the age of 18, a postgraduate degree at 22 and a wedding around 27.

He already puts the full ₹1.5 lakh a year into Sukanya Samriddhi Yojana (SSY), a government-backed savings scheme specifically for girl children, and has another ₹15,000 a month to invest in mutual funds. His question: how should this be invested so no milestone catches him short? And is there any benefit to investing in Ananya's name rather than his own?

The second question has a short answer. The first one requires a reframe.

Meet the Prabhakars

Everything in place, except a plan for Ananya

Abhijeet

Savings account ₹1 lakh

Active SIPs

Car fund ₹12,000 / m

Retirement ₹10,000 / m

Their immediate priority

The right way to invest for Ananya's future

The problem most parents miss

Abhijeet is making a mistake that most parents make without realising it. And that is treating the SSY contribution and the mutual fund SIP as two separate decisions when they are really one.

His ₹1.5 lakh annual SSY contribution works out to ₹12,500 a month into a pure debt instrument. The ₹15,000 SIP goes into equity. Together, that is an effective 55:45 equity-to-debt split for goals that are 17 to 26 years away.

For a horizon this long, that mix is too conservative. The corpus will fall short of the larger milestones, the wedding especially, where the gap could run into a crore or more in tomorrow's rupees.

The fix is conceptual before it is mechanical. SSY and the equity SIP together form a single portfolio with one mission: funding Ananya's life. SSY is the debt sleeve. Mutual funds are the equity sleeve. The right question is what proportion to hold them in. And at 17 to 26 years, that proportion should be tilted heavily toward equity.

Once you frame it this way, most child planning questions answer themselves. Fund selection, tax efficiency, these become secondary. The first decision is asset allocation. Get that right and the rest settles.

What these goals will actually cost

Before deciding the mix, the targets need to be clear.

Education in India is inflating at around 8 per cent a year, well above headline inflation. A wedding can be tracked closer to a normal inflation rate of 6 per cent. Abhijeet's three milestones, priced in tomorrow's rupees, are significantly larger than they look today.

The corpus does not need to hold all three numbers at once. Each milestone draws down a portion while the rest keeps compounding.

The right portfolio for Ananya

The right shift for Abhijeet is to cap his SSY contribution at ₹75,000 a year, half the current amount, and redirect the freed ₹6,250 a month into his equity SIP, taking it from ₹15,000 to ₹21,250. The new split sits at roughly 77 per cent equity and 23 per cent debt.

For the equity portion, a flexi-cap or multi-cap fund is the right core holding. Both allow the fund manager to

What these goals will cost tomorrow

Inflation does not wait. Neither should the plan.

Allocation decides the outcome

One mix funds every milestone. The other falls ₹1 crore short at the wedding.

The inflation rate for undergrad and postgrad is considered to be 8 per cent p.a., while the wedding goal is considered to be 6 per cent p.a. The rate of return for equity is considered to be 12 per cent p.a., and for SSY, 8.2 per cent p.a.

invest across large, mid and small-sized companies, which suits a long horizon well. Mid- and small-cap exposure generates higher long-term growth potential;

the large-cap portion provides relative stability during downturns.

If Abhijeet still claims deductions under the old tax regime, an ELSS fund can replace the redirected ₹6,250 each month, since it carries the same 80C tax benefit the SSY contribution did.

A 7 per cent annual step-up on the SIP, roughly in line with a modest annual salary increase, keeps contributions rising with income without requiring a conscious decision each year.

The inflation rate for undergrad and postgrad is considered to be 8 per cent per annum, while the wedding goal is considered to be 6 per cent p.a. The rate of return for equity is considered to be 12 per cent p.a., and for SSY, 8.2 per cent p.a.

Simulating the outcomes with the revised plan in a similar environment, 12 per cent annual growth in equity mutual funds and 8.2 per cent in SSY, all three milestones are funded, with a ₹40 lakh cushion at the wedding. The default 55:45 plan funds the first two but falls ₹1 crore short at the last one.

The allocation was the only thing that changed.

Two things worth knowing

The last mile. Equity builds the corpus. It is also the wrong place to hold money two years before you need it. Begin moving the goal-specific portion into a short-duration debt fund 24 to 36 months before each milestone. Shift the undergraduate corpus when Ananya turns 15, the postgraduate corpus at 19 and the wedding corpus at 24. Many otherwise sound plans come apart at exactly this stage.

Investing in Ananya's name. Section 64(1A) of the Income Tax Act treats income earned in a minor's name as the parent's income until the child turns 18, which neutralises the supposed tax saving entirely. There is also operational friction: a minor PAN, mandatory folio conversion at 18 and parent-as-guardian on every transaction. None of this is worth the effort. Hold the mutual funds in your own name, earmark the corpus on a tracking sheet for Ananya's goals and transfer the units to her name when she turns 18 via MF Central or the CAMS portal. SSY is the genuine exception. It is by design a beneficiary account in the child's name.

The cost of growing up is high and rising. The answer is not a special child plan or a bundled insurance product. It is the right allocation, held for long enough, with a clear plan for the last few years before each milestone arrives.

That is it. Everything else is noise. ☒

Value Research

For expert advice

Moving into riskier segments

Is it okay to move lumpsum from a large-cap fund to a mid or small-cap fund? I have a sufficient time horizon and would like to increase my returns accordingly.

- Sanjai Kapur

Yes, you can switch a lumpsum from one fund to another. It does not break compounding as long as the money remains invested. So, from a process point of view, there is nothing wrong with it. SIPs are recommended mainly for fresh investments to manage timing risk.

However, moving your entire corpus from large-cap to mid- or small-cap funds is not a prudent move. These segments can be far more volatile and go through long periods of undesirable performance.

Chasing higher returns often means taking on disproportionate risk.

A better approach is to maintain a balanced allocation across large, mid and small caps. This ensures you participate in growth while keeping portfolio risk under control.

Deploying a lumpsum

My FD (fixed deposit) of ₹ 7 lakh is maturing. What should I do?

- Hazrath Vali

When a fixed deposit matures, the instinct is to redeploy the entire amount at once. But if you are planning to move this ₹7 lakh into equity-dominant mutual funds, avoid a lumpsum investment. Markets can be unpredictable in the short term, and timing a single entry can work against you.

A better approach is to invest this amount gradually through a systematic investment plan (SIP) or a systematic transfer plan (STP). You can park the money in a low-risk fund and transfer it into equity over time.

Also, align this decision with your goals and time horizon. If the money is needed within one to three years, sticking to safer options like debt funds may be more appropriate.

Moving a corpus from large-cap to mid- or small-cap funds is not prudent. These segments are volatile and go through long periods of undesirable performance.

Sovereign gold bonds have a fixed tenure of eight years, and the proceeds are automatically credited to your registered bank account

Liquidity across index options

How do index funds compare with ETFs and regular mutual funds with regard to liquidity?

- Sanjay Pandit

Open-end index funds and active mutual funds offer similar liquidity because they follow the same process. You buy and redeem units directly with the fund house at the day's closing NAV, so liquidity is not dependent on market participants.

ETFs work differently. They are listed on stock exchanges and trade like shares during market hours. This means liquidity depends on the availability of buyers and sellers at any given time. In less actively traded ETFs, this can lead to wider bid-ask spreads and even trading at a discount or premium to the underlying NAV.

So, while ETFs offer intraday liquidity, index funds and regular mutual funds provide more reliable execution at fair value for most investors.

At SGB maturity

What happens to the sovereign gold bond at maturity?

- Anonymous

At maturity, you do not need to take any action. Sovereign gold bonds have a fixed tenure of eight years, and the proceeds are automatically credited to your registered bank account. The RBI informs investors about the maturity date in advance.

The redemption price is not the market price on the exchange. Instead, it is based on the average closing price of 999 purity gold over the three business days before maturity, as published by the India Bullion and Jewellers Association.

If you were an original subscriber and hold till maturity, the capital gains are tax-free. However, for bonds bought from the secondary market, gains are now taxable. The 2.5 per cent annual interest remains taxable for all investors.

Parking large sale proceeds

Where should you park money after selling a property?

If you've already identified your next property, keep the money in the bank and complete the transaction. Real estate deals are time-bound and often require quick access to funds, so safety and liquidity matter more than returns.

If there's uncertainty and the money may remain unused for some time, don't let it sit idle in a savings account earning

3.5-4 per cent. Even a small difference in returns can add up meaningfully on large amounts.

You can consider low-risk options like liquid or ultra-short duration debt funds to earn slightly better returns while retaining flexibility. But avoid taking undue risk, this money likely has a defined purpose and timeline, so preservation should come before returns.

Portfolio for tough times

How should one build a crisis-ready portfolio?

Start with asset allocation. Decide how much to allocate to equity based on your comfort with risk.

A simple test of risk tolerance is whether market fluctuations affect your sleep. If they do, your equity allocation is likely too high.

Next, review your investments. If they are driven by trends or recent performance, they need correction. Move towards diversified funds and avoid tactical bets.

Global diversification can also help,

Real estate deals are time-bound and often require quick access to funds, so safety and liquidity matter more than returns

Lifecycle funds aim to replicate some of NPS's flexibility. They are designed to automatically adjust equity and debt allocation as you age.

if done through safe and convenient channels.

Include a small allocation to gold for protection, but treat it as insurance.

Finally, rely on good fund managers. A well-managed portfolio reduces the need for constant monitoring and helps you stay invested through difficult periods.

For long-term investors, market declines are not a threat but an opportunity. Lower prices mean better future returns for disciplined investors.

Lifecycle funds vs NPS

How are lifecycle funds different from NPS?

Lifecycle funds aim to replicate some of the flexibility that NPS offers.

These mutual funds are designed to automatically adjust your equity and debt allocation as you age, similar to the auto-choice option in NPS.

In NPS, you can shift between asset classes without tax impact, and the structure is built specifically for retirement. It also comes with lower costs and disciplined allocation, though it restricts liquidity and requires partial annuitisation at exit.

Mutual fund lifecycle products, on the other hand, are more flexible and easier to access. You are not locked in, and the investment universe is wider, including active and passive strategies across categories.

However, this flexibility cuts both ways. NPS offers structure and cost efficiency, while lifecycle funds in mutual funds are still evolving and their effectiveness will depend on execution over time.

[SCOREBOARD] Guide

Optimise your investments with clear and comprehensive mutual fund data

► Serial Number

A serial number is generated for every fund and is the first column on the Scoreboard. To locate a specific fund, look for this number in the Index against the name of the fund.

► Portfolio Composition

For equity funds, it shows the portfolio's allocation in large-, mid-, small-cap stocks and cash/others. **Value Research** follows its own market-cap classification to arrive at this. The top listed companies that constitute 70 per cent of the market cap are classified as 'large caps'. The ones that fall between 70-90 per cent of the total market cap are classified as 'mid caps'. The smallest listed companies that comprise the remaining 10 per cent of the market cap are called 'small caps'.

In the case of hybrid funds, the minimum and maximum allocations to equity and debt over the past 12 months are displayed. For funds launched within the last year, the available historical range is provided. The equity exposure is shown net of derivatives (unhedged portion).

Portfolio Composition (%)			
Equity		Debt	
Min	Max	Min	Max

► Alpha

Indicates value added (or subtracted) by the fund vis-a-vis the benchmark, for the risk taken. A positive alpha indicates that the fund has performed better than expected, while a negative alpha indicates the fund has underperformed based on the risk taken by the fund manager. It is calculated using calendar month returns for the last three years.

S.No.	Fund Name	Performance								Portfolio Composition (%)										
		Returns (%)				Rank				Large Cap	Mid Cap	Small Cap	Cash & Others	Alpha	Info. Ratio	Risk Grade	Expense Ratio (%)	Assets (₹ cr)	Fund Rating	Average Rating
		1Y	3Y	5Y	10Y	1Y	3Y	5Y	10Y											

Portfolio Composition			
Credit Quality (%)		Avg. Maturity (years)	
High	Medium	Low	

► Credit Quality

Debt fund's portfolio exposure across three levels:

- **High**
Includes exposure to government securities and corporate bonds with the highest grade ratings such as AAA, AAA+, AAA-, A1, A1+, P1+, AA+ and cash.
- **Medium**
Includes exposure to bonds with medium grade ratings such as AA, AA-, A2+ and A2.
- **Low**
Includes portfolio exposure to bonds with lowest grade ratings such as A+, A, A-, A3, BBB+, BBB, BBB-, BB+ and below.

► Average Maturity

Weighted average maturity of all debt securities held by the fund.

► Information ratio

Indicates excess returns generated by a fund relative to the category benchmark and the consistency of that out-performance. A higher information ratio compared to other schemes with the same benchmark reflects better risk-adjusted performance. It is calculated using calendar month returns for the past three years.

► Risk Grade

Value Research Fund Risk Grade measures a fund's risk of loss, focusing only on downside volatility, unlike standard deviation and beta. It accounts for absolute losses and periods of underperformance compared to a risk-free investment. This reflects the risk of earning less than a guaranteed return, such as from a term deposit. Fund risk is calculated by comparing monthly/weekly returns to the risk-free return (State Bank's 45-180 days Term Deposit Rate) and measuring underperformance. Average underperformance is used to derive a risk score, which is rated against the category average. The risk score of a fund is then rated according to the following distribution:

High : Top 10%

Above Avg (+Avg) : Next 22.5%

Average : Middle 35%

Below Avg (-Avg) : Next 22.5%

Low : Bottom 10%

► Fund Rating

The **Value Research Fund Rating** is a convenient composite measure of returns and risk, based on a quantitative system without any subjective components. It provides a quick summary of a fund's historical performance relative to its peers, adjusted for risk. For equity and hybrid funds, the system combines three- and five-year performance periods, while debt funds' ratings are based on 18 months and 36 months of weekly risk-adjusted performance. Only equity funds with a minimum three-year performance history are rated, and for debt funds, the minimum is 18 months. A category must have at least 10 funds with an average AUM of at least ₹5 crore over the past six months to be rated. The rating distribution is as follows:

★★★★★ : Top 10% funds

★★★★ : Next 22.5%

★★★ : Middle 35%

★★ : Next 22.5%

★ : Bottom 10%

NR : Not Rated

► Average Rating

The average of the monthly fund ratings over the past three years. For newer funds, the available rating history is used.

[END NOTE]

The gift of a bad start

For SIP investors, **when** the bad years arrive can matter more than the return itself

Same CAGR, different outcomes

Two 10-year SIPs with identical overall returns, differing only in sequence: bad years early vs at the end

Both cases assume a ₹10,000 monthly SIP over 10 years with a 12 per cent average annual return, differing only in the sequence of yearly returns.

Identical returns, just shuffled

The highs and lows are exactly the same. Only the order in which they arrive gets swapped.

Down markets: More units per rupee

Each ₹10,000 SIP instalment buys far more units when NAV is lower

Units purchased per ₹10,000 at various NAV levels. Base NAV assumed to be ₹100.

Early down years aren't losses; they are bulk purchases at lower prices. Those cheaper units get more time to compound and deliver stronger gains when the good years arrive later.

Rooted in strength, Shaping tomorrow!

Strength of **Large-cap** meets
the growth potential of **Mid-Caps**

Presenting

Nippon India Vision Large & Mid Cap Fund

Nippon India Vision Large & Mid Cap Fund uses a dual strategy, combining the strength of large-cap stocks with the growth potential of mid-caps. Large caps endeavor to provide relative stability & liquidity and mid caps can potentially generate relatively better return.

What the fund offers:

Dual Strategy:
Strength of Large caps,
growth potential of
mid-caps

Strategic Blend:
Industry leaders meet
emerging leaders.

Long-Term Vision:
Optimal mix of market
leaders.

The premium that tests you

“

An object in motion stays in motion with the same speed and in the same direction unless acted upon by an unbalanced force.

— Isaac Newton

”

Some readers will already know what momentum has done in Indian equities over the past two decades. The number is about 21 per cent annualised, against a broader market that did about 14 per cent. That gap, compounded over 21 years, is amongst the largest documented factor premium in any major equity market worldwide.

Here is what I keep coming back to. That premium is real. It is also the most expensive premium to hold. The same data that shows about 21 per cent annualised also shows a 70 per cent drawdown along the way. In calendar year 2008, the Nifty 500 Momentum 50 TRI index fell by 64 per cent. Most investors who looked at the headline return did not collect it. They sold somewhere in the middle. The factor punished them not because the data was wrong but because the journey was longer and rougher than they had budgeted for. Conviction, it

turns out, is not something you can borrow from a back-test.

This supplement is, in essence, an honest argument about that trade. Not a marketing pitch for a factor. Not a warning against it either. We have tried to present the evidence as it stands: the return history, the drawdown history, and the behavioural record of investors who have attempted to stay the course. The case for momentum is strong. The case for holding it is harder. Both halves deserve their full hearing, and both are given one here.

Momentum rewards a very specific kind of investor, one who has stress-tested their own patience before committing capital. This supplement exists to help you do exactly that, and to make the trade-off visible before you make it.

Read it in that spirit. The data is here. The temperament test is here. The decision is yours.

What is momentum?

Most factors are easier to define than to defend. Momentum is the opposite. The definition is almost embarrassingly simple: stocks that have outperformed the market in the recent past tend to keep outperforming for a while longer. Stocks that have lagged tend to keep lagging.

The intuition is everywhere outside the stock market. A cricket team on a winning streak draws bigger crowds and better sponsors, and the streak feeds itself for a few more matches. A film that opens well stays in theatres longer, generates stronger word of mouth, and earns more than a comparable film that opens flat. A trending product gets more shelf space, more advertising rupees and more imitators, and its lead widens before it narrows. The pattern is the same: success in the recent past raises the probability of success in the near future, until something changes the underlying conditions.

Momentum in equities works the same way, but more disciplined. It is not about chasing whatever stock is in the news this week. The standard

signals are price returns over a 12-month or 6-month window, plus the same metrics adjusted for volatility, plus changes in analyst earnings forecasts.

Two varieties, one underlying idea

There are two broad families of momentum worth knowing at the outset.

Price momentum looks at what the share price has done. It is faster, noisier and more responsive to sentiment.

Earnings momentum can be viewed through two lenses: based on past earnings, it reflects the consistency and strength of profit growth; based on earnings outlook, it captures forward earnings expectations, where accelerating growth and upward analyst revisions signal improving fundamentals.

Most rigorous momentum strategies use both, because each compensates for the other's blind spots.

The distinction is explored in detail in Section 6.

What gives momentum its character, and what makes it polarising, is that it is trendy and risky in equal measure. The same stocks that rise quickly also fall quickly when the trend breaks. Drawdowns can be sharp. Turnover is high by definition because winners and losers rotate. Anyone considering momentum needs to know this from the first page, not the last. The factor rewards investors who understand what they are buying. It punishes those who chase it without that understanding.

Aditya Roy/AI-generated Images

Why momentum factor matters

Every factor has a reason to exist. Quality rewards businesses that compound. Value rewards patience with mispriced assets. Low volatility rewards investors who would rather sleep at night than chase the leaderboard. Momentum rewards something stranger: the market's slowness in absorbing news.

This is a behavioural argument before it is a financial one. When a company reports a strong quarter, the share price does not jump to its fair value in a single afternoon. It moves part of the way, then drifts higher over weeks and months as analysts revise estimates, institutions rebalance, and retail investors catch on. The opposite happens with bad news. Markets are efficient over the long run, but inefficient in how quickly they get there. Momentum monetises that lag.

The three biases

Three behavioural tendencies do the work:

Under-reaction: The tendency to anchor on yesterday's view

of a company, even when the facts have changed.

Herding: The tendency to wait for confirmation from other investors before acting on information that is already public.

Fear of missing out: The impulse that keeps a trend alive even after the original news has been priced in.

Each is a structural feature of human investing, not a temporary glitch. None is going away.

Momentum leads, but pays a toll

The highest factor return in Indian equities comes with the deepest drawdown

Index	Annualised return (%)	Annualised volatility (%)	Sharpe ratio	Maximum drawdown (%)	1Y loss probability (%)	5Y median rolling return (% pa)	10Y median rolling return (% pa)
Nifty 500 Value 50 TRI	16.6	25.6	0.4	-66.1	35.4	14.3	14.8
Nifty 500 Momentum 50 TRI	21.1	22.3	0.6	-70.2	25.0	22.0	20.1
Nifty 500 Low Volatility 50 TRI	17.2	16.0	0.6	-48.3	12.6	15.8	15.4
Nifty 500 Quality 50 TRI	16.3	18.1	0.5	-53.6	20.4	16.8	16.2
Nifty 500 Multifactor MQVLv 50 TRI	19.4	17.2	0.6	-53.9	17.3	19.2	18.5
Nifty 500 TRI	13.6	20.1	0.4	-63.7	21.2	13.4	13.6

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Calculations are for the period April 01, 2005 to March 31, 2026. Past performance may or may not be sustained in future and is not an indication of future return. Total Return Index (TRI) considered.

The premium and the price of admission

The data show that momentum has been the strongest-performing factor in India over the past two decades. As seen in “Momentum leads, but pays a toll”, it has delivered annualised returns of over 21 per cent, well ahead of other factors and nearly double the broader market. The lead is even evident on rolling returns. Momentum’s five-year median rolling return is 22 per cent, and its 10-year median is 20 per cent. The premium appears consistently across timeframes.

But the same data shows the price of admission. Momentum has the highest maximum drawdown in the table at over 70 per cent, and its volatility is meaningful even by equity standards. The Sharpe ratio, which adjusts for that volatility, is still the second-best in the set after

Multifactor, but the journey has not been smooth.

This is the central trade-off the supplement will return to. Momentum delivers the highest long-term returns in Indian equities, on both point-to-point and rolling measures. It also asks more of the investor in terms of stomach and time than any other factor. Pretending otherwise would be dishonest. The case is not that momentum is comfortable. The case is that the discomfort is the price of the premium, and that for investors who understand and accept that price, the premium is real, large and globally documented.

The rest of this supplement examines the trade-off that yields the premium and where it works best. How to access it without taking on the worst of its risks. And whether it deserves a place in your portfolio.

Why does momentum work?

Why is momentum the strongest-performing factor in Indian equities? A pattern that delivers a premium this large for this long, across these many markets, should attract enough capital to compete it away. It hasn't. Understanding why requires looking at both what academia has discovered and what human nature refuses to change. The academic case began in 1993. Two finance professors at UCLA, Narasimhan Jegadeesh and Sheridan Titman, published a paper showing that stocks which have performed well recently tend to continue performing well, while poor performers keep lagging.

A strategy of buying winners and selling losers generated significant returns over the next three to 12 months, about 1 per cent per month in some cases. These

profits were not explained by conventional risk factors, suggesting that markets underreact to firm-specific information, with prices adjusting gradually rather than instantly. Subsequent research has found the same pattern across markets and time periods, from developed to emerging economies, including India, where studies show a clear momentum premium. Momentum is not a quirk of one market or cycle, but a broader feature of how markets process information.

The behavioural engine

It is straightforward. Investors anchor to outdated views and slowly update their expectations. A strong result, an order win or a regulatory shift does not immediately reset valuations. The market adjusts in stages, initially partially, then again as confirmation builds. Each step pushes prices in the same direction. The disposition effect reinforces this lag, as investors sell winners early to lock in gains, keeping prices below fair value for longer and allowing the trend to continue.

There is also a structural layer that compounds the behavioural one:

Capital follows price. Stocks that begin to perform well attract institutional flows, index inclusion and greater analyst coverage, creating a feedback loop that sustains the trend.

Earnings momentum evolves gradually.

When companies beat expectations, analysts cautiously revise forecasts upward in increments over multiple quarters, leading to a steady re-rating.

Why price and earnings work together

Price and earnings momentum reflect the same process at different speeds. Price momentum is faster and noisier, capturing sentiment and flows in real time. Earnings momentum is slower but more durable, tied to the rhythm of earnings and revisions. Used together, they filter noise while preserving early signals.

Momentum exists because markets are made of people who adjust slowly. As long as that remains true, the factor is likely to persist.

Who is investing in momentum?

For most of the last three decades, momentum was a strategy for which you needed a Bloomberg terminal and a quantitative team to access. The premium was real, the academic literature was growing, but the cost of running a disciplined momentum portfolio (screens, rebalancing, transaction costs) kept it out of reach for retail investors. That has changed. That factor is now a product anyone with a brokerage account can buy.

India's five-year arrival

India's momentum journey has been compressed into five years. In March 2020, momentum AUM in Indian mutual funds was effectively zero. By March 2026, it had grown to roughly ₹28,648 crore across 53 schemes. While still small relative to the broader equity mutual fund universe, the trajectory is unmistakable. Momentum is no longer theoretical or niche; it is investable at scale.

The scheme count highlights how quickly the category has arrived. From just two momentum-oriented schemes in March 2021 to 53 by March 2026, the expansion reflects both supply and demand. What distributors once ignored is now part of their regular product line, and investors who earlier had to choose only between active and passive funds now have a third option.

Three forces have driven this catch-up:

- Improved product availability under SEBI's smart-beta framework.
- Rising investor awareness of factor investing as a third option alongside active and passive.
- Strong recent performance of momentum in Indian equities, which has pulled capital toward the factor.

The global picture, at scale

Globally, this shift happened earlier and on a far larger scale. Momentum is now firmly embedded within the smart-beta

A factorial growth

Momentum funds in India have moved from concept to reality in half a decade

Source: ICRA, NJ AMC's Internal Research. All Passive and Active Smartbeta Funds are considered. Momentum-oriented refers to those funds that focus on the momentum factor alone as well as combined with other factors like quality, low volatility etc. Past data may or may not be sustained in the future.

ecosystem. The largest products, including the iShares MSCI USA Momentum Factor ETF and offerings from Invesco, manage tens of billions of dollars. Their size signals that institutional investors treat momentum as a core building block, not a tactical trade.

A wider lens makes the same point. Within the broader smart-beta and factor-based ETF universe, which spans quality, value, low volatility, momentum, multi-factor and others, total assets have grown from a niche corner of the asset

Destination for diversification

Listing the top five momentum factor ETFs in the US

Source: Bloomberg. Data as of March 31, 2026.

management industry a decade ago to a multi-trillion-dollar segment today. Among these factors, momentum has been one of the fastest-growing sub-categories, with both its share of total smart-beta AUM and its compound growth rate rising materially over the last 10 years. In the US alone, where momentum ETFs have the deepest history, AUM has grown from a third of a billion dollars in 2005 to over \$56 billion in 2025, an increase of more than 150 times over 20 years. Momentum now sits alongside value and quality as a key factor in allocation, but with stronger recent growth. It is no longer a niche strategy. It is part of the mainstream toolkit.

How a niche became normal

US momentum ETFs AUM has grown from a third of a billion in 2005 to over \$56 billion today

Where has momentum worked?

A premium that exists in only one market, in only one period, is a coincidence. A premium that exists in every major market, in nearly every sub-period, is a feature. Momentum belongs to the second category. The geographic case for the factor is, on the data, almost embarrassingly consistent, as seen in the visual titled "A premium with a passport".

USA: The most analysed lab

Start with the United States, the most analysed equity market in the world. From mid-1995 to early 2026, US momentum delivered annualised returns of 12.5 per cent, compared with the broader market's 10.4 per cent. The 210-basis-point edge is meaningful, but the more telling number is the rolling-return gap. Over the entire period, three-year median rolling returns for momentum stood at 13.3 per cent against 11.4 per cent for the market;

10-year median rolling returns were 9.0 per cent against 8.2 per cent. Momentum did not win every sub-period (the early 2000s and the 2007 to 2012 stretch were closer fights). Still, the cumulative arithmetic favours it, with the 2019 to 2026 sub-period showing a four-percentage-point annualised lead.

Europe: A similar pattern

Europe is a younger laboratory. The S&P

Europe 350 Momentum index has a shorter history than the US, but the pattern is the same. From mid-2014 to early 2026, European momentum returned just under 12 per cent annualised against the market's 8.1 per cent. The four-percentage-point edge is wider than the US gap, and 10-year median rolling returns of 11.1 per cent against 7.6 per cent reinforce the lead. Europe's economic cycles have been more turbulent than the US over the same window (sovereign debt, energy shocks, monetary divergence), yet the premium has held. If anything, harder cycles have given the factor more to work with.

From Wall Street to Dalal Street, the evidence for momentum crosses every border

strongest case in the world. From April 2005 to March 2026, the Nifty 500 Momentum 50 index delivered over 21 per cent annualised returns, compared with the broader market's 13.6 per cent. That is a 750-basis-point premium compounded over 21 years,

larger than most other major equity market in the dataset. The lead is consistent across sub-periods: 23.9 per cent against 14.8 per cent in 2005 to 2012; 21.3 per cent against 12.8 per cent in 2013 to 2018; 17.9 per cent against 12.9 per cent in

2019 to 2026. Three-year median rolling returns for Indian momentum are just under 20 per cent, compared with the market's 13.5 per cent. Ten-year medians are 20.1 per cent, compared with 13.3 per cent.

India: The strongest case

India, on the same data, is the

Why is India's edge so large? Several reasons stack on top of each other:

- **Less efficient markets historically**, with thinner analyst coverage outside the largest names and slower information diffusion.
- **High retail participation** amplifies trends in both directions and lengthens the windows over which momentum signals remain profitable.
- **Larger index inclusion effects** in absolute terms, because passive flows are still growing.

● **The structural growth backdrop** of the Indian economy is such that once fundamental trends are established, they tend to persist longer than in slower-growing markets.

The geographic story matters because it eliminates the "lucky country" objection. If momentum only worked in America, it would be a curiosity of that market's microstructure. It works in America, in Europe, and most powerfully in India. The premium travels. So does the discipline required to capture it.

Types of momentum and parameter comparison

Momentum sounds like one thing. There are at least four. Strategies built on different parameters can look similar at the surface but behave quite differently inside a portfolio, particularly during stress. The choice of parameter is what separates a momentum portfolio that compounds steadily from one that whips around with the cycle.

This section compares four definitions of momentum used in rule-based strategies:

Raw price momentum — ranking stocks by past price return.

Risk-adjusted momentum — Scaling the raw price momentum by volatility.

Alpha-based momentum — stripping out the expected stock return as per its systematic risk to isolate stock-specific return.

Earnings momentum — tracking changes in earnings

and analyst forecasts rather than price.

Each captures a different signal. Together, they show why disciplined construction matters more than any single parameter.

Raw price momentum: Starting with the simplest signal

The simplest definition is the cleanest. Rank stocks by their price return over the previous 6-12 months. This anchors most academic literature, and it is the version most retail investors picture when they

Raw price momentum: The textbook starting point

Twelve-month price momentum sorts winners from laggards cleanly, but with a rough ride

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Data for the period September 30, 2006 to March 31, 2026. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

think of momentum.

The data shows it works. The top 100 stocks by 12-month momentum delivered annualised returns of 19 per cent, compared with 11.6 per cent for the Nifty 500 TRI and five-year rolling returns of nearly 23 per cent. The bottom 100 returned under 3 per cent and lost money over a five-year window roughly four times in 10. The signal sorts winners from losers cleanly. The catch is volatility: the top portfolio's drawdown reaches nearly 70 per cent, wider than the broader market's. Raw momentum captures the premium, but asks to ride a violent journey to get there.

Risk-adjusted momentum: Adjusting for the volatility

The next refinement adjusts the momentum signal based on the underlying stock's volatility. A stock that has risen sharply with less volatility shows a more reliable trend than one that has risen sharply on wild swings. Scaling momentum by volatility tilts the portfolio toward stocks with more durable trends.

The improvement is small in absolute return: the top 100 returns 20.2 per cent against the unscaled version's 19 per cent, but more meaningful in volatility, which falls from 20.8 per cent to 19.6 per cent. The five-year rolling return rises from

Risk-adjusted momentum: Adjusting for the volatility

Adjusting momentum for volatility tightens the trade-off without sacrificing return

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Data for the period September 30, 2006 to March 31, 2026. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

Alpha-based momentum: Stripping out the expected return

Ranking by alpha isolates the part of a stock's return that is genuinely its own

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Data for the period September 30, 2006 to March 31, 2026. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

22.8 per cent to 24.3 per cent. The risk-adjusted gain is real. The trend is the same, identified more cleanly.

Alpha-based momentum: Isolating stock-specific return

A third refinement isolates the part of a stock's return not explained by its exposure to the broader market, measured by beta. Theoretically, the higher the beta, the higher the expected return. Alpha adjusts the stock's actual return for this expected return. Ranking stocks by alpha rather than raw price return identifies those that are outperforming for stock-specific reasons, not because the market is dragging them along.

Alpha-based momentum returned

18.5 per cent for the top-ranked stocks, slightly below raw price momentum's 19 per cent, but with steeper drawdowns and higher volatility. The data suggests that chasing pure alpha in isolation, without combining it with other factors, is unwise.

Earnings momentum: When fundamentals do the talking

The fourth definition does not look at price at all. It looks at earnings, specifically at whether a company's profits are actually growing quarter on quarter. The simplest measure is trailing quarterly EPS: if a company earned more this quarter than it did a year ago, that is earnings momentum. Rising profits, sustained over several quarters, signal

Earnings momentum: The slower, more durable signal

Earnings momentum moves with fundamentals, not sentiment, and lasts longer for it

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Data for the period September 30, 2006 to March 31, 2026. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

that the underlying business is genuinely strengthening. Earnings momentum delivered 17.8 per cent annualised at the top, with a 20-percentage-point spread over the bottom portfolio. The numbers are slightly lower than the price-based variants, but the signal is qualitatively different. Earnings momentum is slower to show up but more durable once it arrives, anchored in actual business results rather than price-driven sentiment.

Why the combination matters

Each of these parameters is doing useful work. Raw price momentum is fast but noisy. Volatility-scaled momentum is fast and cleaner. Alpha is slower but better at

separating signal from market beta.

Earnings momentum is slowest but most durable. A well-built momentum strategy does not pick one and ignore the others. It blends them, because the false positives of one parameter are often filtered out by the strengths of another.

The deeper point is that "momentum" as a single label hides a meaningful range of construction choices. A retail investor cannot replicate this multi-parameter strategy using a screener. A rule-based fund, built on a research platform that can run thousands of variants and rebalance disciplined portfolios at scale, can. That is the structural reason the factor is moving from institutional to retail in the form of products rather than DIY strategies.

Does momentum work across size and sectors?

There is a persistent assumption in factor investing that momentum is a large-cap phenomenon. The reasoning sounds plausible: large stocks are more liquid, more widely covered and easier to trade in size, so any signal requiring regular rebalancing should work best where trading frictions are lowest. The data do not agree.

Where the spreads widen

Run the same momentum test across large-, mid-, and small-cap universes, and a clear pattern emerges. The factor works in all three. It works most powerfully where the conventional wisdom expects it to work the least. The visual titled "The spread that breaks the myth" summarises the result.

In large caps, the top tercile by

momentum returns 16.3 per cent annualised, compared with the bottom tercile's 8.4 per cent, a spread of about 7.9 percentage points. The spread is real but modest. The market for large-cap information is efficient enough that momentum signals get priced in faster, and the gap between the best and worst

The spread that breaks the myth

Momentum's edge widens as you move down the market-cap scale

Market capitalisation	Portfolio/Index	CAGR (%)	Annualised volatility (%)	Max. drawdown (%)	5Y loss probability (%)	Median rolling return (% p.a.)

	Bottom Tercile	5.5	23.6	-76.4	30.2	1.7	10.9	4.1	6.9
	Small Cap	12.4	21.0	-75.6	8.1	8.0	17.4	13.5	14.8

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Data for the period September 30, 2006 to March 31, 2026. Momentum is measured based on a combination of 3-month and 9-month momentum parameters. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

momentum stocks is correspondingly smaller.

In mid caps, the spread widens dramatically. The top tercile returns 20 per cent, compared with the bottom tercile's 4.8 per cent, a 15-percentage-point gap. In small caps, the pattern is sharper still: the top tercile returns 21 per cent against the bottom tercile's 5.5 per cent. The further down the market-cap scale you go, the larger the dispersion. The factor does not just survive; it thrives in mid- and small-cap stocks.

The reason is structural, not statistical. Mid- and small-cap stocks have thinner analyst coverage, slower information diffusion and lower passive ownership. New information takes longer to be priced in, leaving a longer window for momentum signals to capture the move. The same inefficiency that makes these stocks harder to research makes the factor more profitable in them.

The practical implication is that a momentum strategy restricted to the largest 50 or 100 stocks captures the smallest portion of the available premium. A broader universe, such as the Nifty 500, captures more because dispersion is largest where coverage is thinnest. Breadth is not a side-effect of universe choice. It is a direct contributor to momentum's edge.

More uniform than expected

If size dispersion suggests momentum works in pockets, sector data suggest it works almost everywhere. Of the 19 sectors analysed, momentum stocks outperform their low-momentum peers in 18 of them. They also exhibit lower volatility in 18. The median alpha across sectors, measured on five-year rolling returns, is 6.7 per cent. Excess volatility is negative on median. High-momentum stocks are not just earning more; they are doing so with less risk than the low-momentum half of their own sector.

Momentum, almost everywhere

In eighteen of nineteen sectors, momentum stocks earn more and swing less

The sector-level summary is striking because it eliminates one of the most common objections to factor investing: that the premium is concentrated in a few sectors and disappears on closer inspection. It does not disappear. It is broadly distributed. There are sectors where it works more powerfully, but very few where it does not work at all.

Where the signal is loudest

The five strongest sectors are Consumer Discretionary, Telecommunications, Chemicals, Consumer Staples and Industrials. In each, the top half of momentum-ranked stocks substantially outperforms the bottom half across one-year, three-year, five-year and 10-year rolling windows, with materially lower drawdowns and loss probabilities.

Consumer Discretionary shows the most extreme pattern: the top half returns 14.9 per cent against the bottom half's -2.0 per cent, with a five-year loss probability of essentially zero against the bottom half's 53 per cent.

The structural common thread is intuitive. These are sectors where company-specific operating performance dominates returns:

- **Consumer Discretionary** — driven by brand cycles and demand trends.
- **Telecommunications** — driven by market share and capex decisions.

● **Chemicals** — driven by product portfolios and capacity build.

● **Consumer Staples** — driven by brand strength and pricing power.

● **Industrials** — driven by order books.

Momentum signals work best where idiosyncratic information matters most, because the market takes time to absorb it. Sectors driven primarily by external variables (commodity prices, interest rate cycles, regulatory pricing) are where the factor's edge narrows. Even there, the data does not show the factor failing. It shows that it works less powerfully.

The composite picture

Put the size and sector evidence together and the conclusion is starkly different for the investor with a conventional view. Momentum is not a large-cap, narrow-sector trade. It is a broad-universe phenomenon whose largest premiums are found in the parts of the market where most active managers, distributors and retail investors spend the least time looking. A disciplined strategy that invests only in the safest assets misses most of the premium. The factor's edge comes from going where the inefficiency is, precisely where research is thinnest. That is not a flaw. It is the strategy.

Where the signal is loudest

In five sectors, the gap between high and low momentum stocks is unmistakable.

Sectors	Portfolio	Annualised return (%)	Sharpe ratio	Annualised volatility (%)	Maximum drawdown (%)	Loss probability (%)		Median rolling return (% p.a.)			
						3Y	5Y	1Y	3Y	5Y	10Y

Past performance may or may not be sustained in future and is not an indication of future return.

Raw momentum vs filtered momentum

A raw, unfiltered momentum strategy has a clear flaw: it cannot distinguish between quality and junk. A stock that has rallied 80 per cent on weak fundamentals can look identical, on a momentum screen, to one backed by genuine business strength. Both qualify, but one compounds while the other can collapse.

This is the core practical challenge with raw momentum. Its sharp drawdowns often occur when the market corrects low-

What filtering buys you

A quality floor and a volatility check lift returns and lower drawdowns

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Data for the period September 30, 2006 to March 31, 2026. Raw momentum portfolio represents top 100 stocks from Nifty 500 based on only momentum parameters. Filtered momentum portfolio represents top 100 stocks based on the same momentum parameters after filtering low quality and high volatility stocks from Nifty 500. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

quality names that should not have been in the portfolio. Address this, and the factor's risk-return profile improves significantly. Ignore it, and the ride becomes more volatile than it needs to be.

The problem with raw, unfiltered momentum

Pure momentum, in its simplest form, ranks stocks by past price performance, selects the top decile and rebalances periodically. It is straightforward, mechanical and has delivered strong long-term returns. But it is also indiscriminate. There are no checks on fundamentals or stability, so it can include stocks whose rises are fragile or erratic. The strategy works on average, but that average masks its weakest moments.

Three failure modes tend to recur:

Crash risk — when markets turn, recent winners often fall the fastest.

Crowding — as more capital follows momentum, the same stocks dominate portfolios, making exits messy when sentiment shifts.

Macro-driven reversals — events such as rate changes or geopolitical shocks, temporarily break the link between past and future performance.

This raises the question: can momentum be refined to retain its premium while reducing these risks?

What filtering does

Filtered momentum starts with the same universe and signals but adds two screens before selection: a quality, extreme overvaluation, and a volatility filter. Companies with weak balance sheets, poor cash flows, or inconsistent earnings are excluded, as are stocks with extreme price swings. The remaining stocks are then ranked by momentum, and the top names are selected.

The key distinction is that the filter does not replace momentum; it refines the universe. Momentum still drives the ranking and final selection. Quality and volatility filters set a minimum standard, ensuring the strategy remains momentum-driven while avoiding the weakest names.

The data makes the trade-off clear. A raw momentum portfolio delivers 22.1 per cent annualised returns and a steep 64 per cent drawdown. Adding volatility, quality and value filters maintains the return of 22 per cent per annum while reducing the maximum drawdown to 59 per cent. Risk control and adherence to fundamentals clearly add measurable value.

The key takeaway is that these filters do not come at the cost of returns; they enhance them while meaningfully

reducing risk. The stocks it removes are typically those responsible for the worst drawdowns, adding volatility without contributing to long-term performance. The filtered approach improves both sides of the risk-return equation rather than forcing a trade-off.

Why this matters for portfolio construction

The case for filtering is not just analytical; it is practical. A retail investor cannot easily replicate a multi-stage process that combines quality screens, volatility filters, and disciplined rebalancing using basic tools. Applying these checks at scale requires robust

data on balance sheets, cash flows, earnings consistency, and continuous risk measurement. These capabilities typically sit within an asset manager's research setup.

This is why rule-based momentum products matter. The factor itself has been known for decades, but the infrastructure to implement it well has only recently become accessible through mutual funds in India. What was once an institutional capability is now available to retail investors. The broader point: momentum is easy to understand as an idea, but executing it well is not. That gap separates a factor that looks good in theory from one that delivers in practice.

Should you invest in momentum?

Every section of this supplement so far has been about the factor. This one is about you, the investor. The two questions are different. Whether momentum works as a strategy is a matter of data, and the data has answered that question. Whether momentum works for you is a matter of temperament, time horizon and self-knowledge, and only you can answer it honestly.

Is momentum right for you?

Momentum is a factor for investors with a high tolerance for short-term pain and a long enough horizon to wait out the cycles where it underperforms. Five years is the practical minimum. Ten is more honest. Median rolling returns over five- and 10-year windows are strong, but the journey across any single five-year stretch can be uncomfortable. An investor who

needs the money in three years, or who loses conviction during a 20 per cent drawdown, will not capture the premium. They will exit at the wrong time, lock in the discomfort, and miss the reward.

The calendar-year data makes the temperament test clear. The Nifty 500 Momentum 50 index has outperformed the broader market in 15 of the last 22

calendar years, the highest hit rate among all factors. But the seven years of underperformance are not mild. In 2008, the index fell by over 64 per cent. In 2009, it gained 59 per cent while the broader market rose 86 per cent. In 2018, 2022, and 2025, it lagged by single-digit to mid-teen margins despite positive markets. Investors who exited after such years would have missed 2017's 70 per cent return, 2021's 77 per cent, and 2023's 48 per cent.

The years that test conviction

Momentum has won 15 years out of 22, but the losing years are not gentle

Index	Nifty 500 Momentum 50 TRI (%)	Nifty 500 TRI (Benchmark) (%)	Excess return (%)	
2005	70.9	38.5	32.5	
2006	60.3	36.2	24.1	
2007	128.9	64.6	64.4	
2008	-64.6	-56.8	-7.8	
2009	59.0	85.7	-26.6	
2010	20.6	15.3	5.3	
2011	-20.5	-26.4	6.0	
2012	51.6	33.5	18.1	
2013	12.1	3.9	8.2	
2014	69.7	39.1	30.6	
2015	11.0	0.0	10.9	
2016	-1.6	4.7	-6.2	
2017	69.5	37.7	31.9	
2018	-10.9	-1.6	-9.3	
2019	8.6	8.6	0.0	
2020	20.9	17.7	3.2	
2021	76.9	31.0	45.9	
2022	-7.6	4.3	-11.8	
2023	47.7	26.9	20.8	
2024	26.5	16.0	10.5	
2025	-8.0	7.3	-15.3	
2026	-13.1	-14.0	1.0	
O/P	15/22	-	-	

Source: NSE.

The pattern is the point. Momentum does not deliver steady outperformance. It comes through bursts of strong gains and sharp corrections, often during bearish market phases. Investors who stay through 2008 and 2025 capture 2007, 2014, and 2021. The two cannot be separated.

Why the cycle matters

Momentum's behaviour is closely tied to the broader economy's cycle. The premium does not arrive evenly across market phases. It arrives in expansions and gives back in contractions, and the gap between the two is large.

Across market cycles, momentum's behaviour is consistent:

Expansions — when growth and earnings are rising, it has been the strongest factor in Indian equities, delivering average half-yearly returns of nearly 26 per cent.

Recoveries — it trails value but still posts strong gains.

Slowdowns — its edge narrows.

Contractions — it becomes the weakest factor, with average losses of nearly 16 per cent.

This cyclical nature is not a flaw but the source of the premium. Factors that work in all environments do not earn excess returns because they carry no real risk. Momentum pays investors for enduring the difficult phases so they can benefit during expansions. Those who stay invested capture the upside. Those who exit do not.

The current Indian backdrop matters. The economy is in a multi-year expansion, with growth above global averages and strong investment and earnings trends. This is the environment where momentum has historically delivered its best outcomes.

Why valuation regimes matter too

A second layer of context is valuation. Momentum behaves differently in different valuation environments, and the differences are large enough to affect

Where momentum earns its premium

The factor leads in expansions and lags in contractions, by design

Recovery (%)		Expansion (%)		Slowdown (%)		Contraction (%)	
Nifty 500 Value 50	46.8	Nifty 500 Momentum 50	26.0	Nifty 500 Low Volatility 50	2.4	Nifty 500 Low Volatility 50	-9.9
Nifty 500 Quality 50	34.7	Nifty 500 Value 50	24.2	Nifty 500 Multifactor MQVLv 50	0.8	Nifty 500 Multifactor MQVLv 50	-11.4
Nifty 500 Multifactor MQVLv 50	32.3	Nifty 500 Multifactor MQVLv 50	19.8	Nifty 500 Quality 50	0.4	Nifty 500 Quality 50	-12.7
Nifty 500 Low Volatility 50	27.2	Nifty 500 Quality 50	17.3	Nifty 500 Momentum 50	0.1	Nifty 500 Value 50	-13.9
Nifty 500 Momentum 50	23.6	Nifty 500 Low Volatility 50	16.0	Nifty 500 Value 50	-6.8	Nifty 500 Momentum 50	-15.6

Source: NJ AMC Internal Research, CMIE, NSE, NJ AMC SmartBeta Research Platform. Factors refer to Nifty 500 (Value 50 TRI, Momentum 50 TRI, Low Volatility 50 TRI, Quality 50 TRI, Multifactor MQVLv 50 TRI). Half-yearly periods (Apr 2005–Mar 2026) are classified into four market phases; the shown returns are the average absolute half-yearly returns within each phase. Past performance may or may not be sustained and is not indicative of future returns. Total Return Index (TRI) used.

how an investor should think about timing and expectations.

The data shows that momentum's forward returns are strongly shaped by the valuation at entry, and the relationship is straightforward: the cheaper the market, the stronger the subsequent return. In undervalued markets, momentum has delivered 29.9 per cent over six months and 63 per cent over twelve. In fairly valued markets, returns moderate meaningfully. In overvalued markets, they compress to low single digits.

The takeaway is not to time momentum based on valuation, but to recognise that entry point matters. Investors who add to momentum allocations during periods of market stress, when valuations are depressed, have historically been rewarded most.

Who should not invest in momentum?

The honest answer is that most investors cannot. Momentum is not a beginner's factor or a comfort strategy. It demands the ability to sit through 30 to 50 per cent drawdowns, something even experienced

investors struggle with. It punishes those who enter after strong years and exit after weak ones. If the honest answer to "could I have held through 2008?" is no, then momentum should not be the core of your equity allocation. At best, it can play a satellite role.

For those who can hold, the case is compelling. Momentum has one of the strongest documented premiums in Indian equities, access has improved, and the broader environment remains supportive. The only real question is whether the investor has the temperament to stay the course.

Valuation at entry drives the return

Momentum's edge is sharpest at the lowest valuation

Valuation Zone	Next 6M returns (%)	Next 12M returns (%)
Over-valued Zone	3.6	6.2
Fairly-valued Zone	8.7	23.1
Under-valued Zone	29.9	63.0
Alpha	26.3	56.8

Data covers the period Sep 30, 2011 to Mar 31, 2026. Valuation zones are defined by comparing the momentum portfolio's current valuation against its 5-year historical average. Returns shown are median returns for each respective zone and horizon. Past performance is not indicative of future results.

Key takeaways and the road ahead

Momentum is not a new factor. It has been documented in the academic literature for over 30 years, tested across every major equity market, and refined into rule-based portfolios for nearly two decades. What is new is access. Until recently, capturing the premium in a disciplined way required institutional infrastructure that most retail investors did not have. That has changed.

The Indian story is the story of catching up. Smart-beta funds focused on momentum have grown from effectively zero AUM in 2020 to over ₹24,000 crore across 42 schemes by early 2026. The category is small relative to the broader equity mutual fund industry, but the trajectory is unmistakable, and global allocations suggest more room to grow. Mature markets have routed substantial portions of their factor allocations toward momentum. India is on a similar path. The penetration gap is large, the macro backdrop is favourable, and the products exist.

Three propositions to carry forward

Three propositions sit at the centre of this supplement:

The premium is real, large and globally consistent — the largest documented factor premium in Indian equities, and meaningful even in the most efficient markets in the world.

The premium comes with a price — high drawdowns, cyclicity, and a temperament test that not every investor will pass.

Filtering for quality and volatility, when applied as a floor rather than a selection criterion, captures the premium more cleanly and with less of the volatility that historically drove investors out at the wrong moments.

The road ahead

Rule-based momentum is not a tactical trade for the next bull run. It is a permanent allocation for investors with the horizon and temperament to hold it through full cycles. As factor investing matures in India and more sophisticated implementations become available, momentum will increasingly take its place alongside quality, value, and low volatility as a core building block of disciplined portfolios.

Momentum did not just work in the past. It is, on the evidence presented across the previous nine chapters, one of the most rigorous strategies available to systematic investors in India today, and one whose access has finally caught up with its analytical case. For investors with the horizon and discipline to use it, momentum is not a relic of past cycles. It is the future of systematic investing in India. ☒
