Stock Picker's Paradise Beyond the Nifty

For more than three months, the Nifty 50 has moved within a narrow and often frustrating range for investors and traders. Such periods test them more severely than a decisive correction because they create uncertainty without offering resolution. The resulting gloom, however, rests on an incomplete reading of the market. The headline index may have been subdued, but beneath it, a substantial part of the market has continued to advance. In our experience, this is precisely when investors must distinguish between an index that measures a handful of heavyweights and a market that contains hundreds of individual businesses.

The evidence is persuasive. Between the beginning of April and the end of August, 384 of the BSE 500 constituents, or 76.8 per cent, delivered positive returns. More than half gained over 10 per cent, 212 stocks rose by at least 20 per cent, and 50 advanced by 50 per cent or more. The median constituent return was approximately 14.24 per cent, a more reliable measure than the average because it is not distorted by the six stocks that more than doubled. In other words, the typical BSE 500 stock performed meaningfully better than the movement in the frontline indices would suggest.

This divergence is not difficult to explain. The Nifty 50 and other frontline indices are weighted by market capitalisation. A relatively small group of large companies therefore exerts disproportionate influence over index returns. When these heavyweights consolidate, gains across mid-sized and smaller companies may barely register at the index level. The recent period has consequently been less a stagnant market than a broad rotation of capital beyond the largest names.

Market valuations have corrected considerably from the exuberant levels seen after 2024, providing a better margin of safety than existed during the earlier phase of the cycle. Global equities have also remained broadly constructive. India can diverge from international markets for meaningful periods, but a prolonged domestic bear market becomes less likely when global liquidity, risk appetite and economic expectations remain supportive. This is a favourable backdrop, not a guarantee.

Foreign institutional selling has continued to weigh on large-cap shares, partly because competing markets offer attractive opportunities. Yet domestic savings channelled through mutual funds and other institutions have provided a meaningful counterbalance. The stability of the rupee is equally important. Persistent currency weakness has historically complicated foreign flows and market performance. A steadier exchange rate would reduce one source of pressure. This is what we are currently experiencing, especially after the Reserve Bank of India introduced a special FCNR(B) deposit mobilisation scheme, under which banks were allowed to offer higher interest rates to attract foreign currency deposits. The scheme, which was opened for mobilisation until August 31, has resulted in significant inflows into the banking system.

For the Nifty to break out of its current range, leadership must return to the index heavyweights. Banking and financial services, which account for nearly one-third of the index, will be crucial. HDFC Bank, one of the largest index constituents, has remained under pressure amid the departure of senior executives, with the stock trading near multi-year lows and weighing on the Nifty. Technology stocks have also underperformed, although the prolonged weakness may be creating a more favourable risk-reward balance. Meanwhile, real estate, capital goods, pharmaceuticals and metals may offer selective opportunities as sectoral leadership rotates.

Investors should assess market breadth, earnings and valuations together rather than rely solely on headline index movements. Opportunities remain, but careful stock selection is essential. DSIJ's research will help you identify fundamentally sound companies available at reasonable valuations. When the index appears misleadingly calm, the appropriate response is not greater aggression, but closer observation and informed decision-making.

What is Re-rating?

I have been reading Dalal Street magazine for the past few months, and I must say that it has helped me significantly improve my knowledge of investing. I have come across the term 're-rating' several times and would like to understand it better. Could you please explain what it means and how it affects a stock's valuation?

- Saniya Dwivedi

Editor Responds: Thank you for your kind words. Re-rating refers to a change in the valuation multiple that investors are willing to pay for a company's shares. For instance, if a stock was trading at a P/E multiple of 15 and investors later value it at 20 times earnings, the stock has undergone a positive re-rating. This generally happens when the market becomes more optimistic about the company's growth prospects, profitability, business quality or future earnings. Conversely, a decline in the valuation multiple is called a de-rating. Importantly, re-rating can drive stock prices higher even when earnings growth remains moderate. However, investors should assess whether the higher valuation is supported by sustainable earnings growth and improving fundamentals.

Market Watch

Crude Pressure and Policy Signals Keep Markets Cautious

The unresolved U.S.-Iran conflict kept crude prices elevated through much of the period. Brent briefly eased towards USD 87 per barrel amid diplomatic activity around the Strait of Hormuz, with Iran and Oman working on arrangements to improve traffic through the key energy route. However, prices recovered to around USD 89 by the end of the fortnight. For India, which imports around 85–88 per cent of its crude requirement, elevated oil prices remained a risk for inflation, the current account and the rupee. This kept domestic equities sensitive to every change in the crude price outlook.

The closing auction session also drew attention during the fortnight. On August 27, the Sensex's indicative closing level briefly pointed to a fall of more than 3 per cent during the auction, despite the index trading only modestly lower beforehand. The episode brought the new closing-price mechanism into focus around the monthly derivatives expiry.

Indian benchmark indices ended the fortnight lower. The Nifty 50 declined 0.78 per cent to 24,175.65, while the BSE Sensex fell 0.95 per cent to 77,264.51. Both indices also registered their third consecutive weekly decline, while the Nifty went through a seven-session losing streak. India VIX, however, declined by around 5.5 per cent, from 11.30 to 10.68.

Sectoral performance remained mixed. Metal was the strongest performer, gaining 3.02 per cent. Broader markets held up better, with the BSE 250 Smallcap Index rising 0.87 per cent and the BSE 150 Midcap Index gaining 0.35 per cent. FMCG was the weakest sector, declining 2.91 per cent during the fortnight.

Institutional flows remained an important support for the market. FIIs recorded net sales of ₹3,661.89 crore, while DIIs bought ₹36,626.05 crore. The sizeable gap between domestic buying and foreign selling helped absorb part of the external pressure and supported market liquidity despite weakness in the benchmark indices. The divergence also showed how strongly domestic institutions continued to counter foreign outflows during the period.

On the macro front, RBI MPC minutes reflected greater caution on inflation, with policymakers indicating that a rate increase could become necessary if price pressures persisted. India's foreign exchange reserves reached a record USD 729.33 billion.

Industrial production grew 6.7 per cent year-on-year in July, with capital goods output rising 16.1 per cent. The RBI's August bulletin also flagged risks from elevated crude oil prices, geopolitical uncertainty and global trade disruptions,

Crude oil, hawkish central banks and divergent institutional flows kept markets cautious despite strong domestic buying.

keeping inflation concerns in focus.

Going ahead, crude oil developments, the U.S. Federal Reserve's September decision, the RBI's evolving policy stance and the direction of institutional flows are likely to remain the key market triggers.

Dynamic Cables Ltd

POWERING THE NEXT LEG OF CABLE GROWTH

HERE IS WHY

Strong growth with improving mix

Renewable and export opportunities expanding

Capacity expansion supports future growth

India's wire and cable industry is expected to grow at around 10–12 per cent CAGR over the next five years, supported by government infrastructure spending, power transmission and distribution investments, renewable energy integration, private capex and urbanisation. Hence, we recommend Dynamic Cables Ltd. as our Choice Scrip. Dynamic Cables is a manufacturer of power infrastructure cables, including high-voltage (HV), low-voltage (LV), power control and instrumentation cables and conductors. The company has progressively shifted its portfolio towards higher-value products, with HV cables accounting for 63 per cent of FY26 sales, followed by LV cables at 29 per cent, conductors at 6 per cent and other products at 2 per cent.

In Q1FY27, revenue increased 33 per cent YoY to ₹349 crore, while operating profit rose 41 per cent to ₹38 crore. Operating margin improved to 10.9 per cent from 10.3 per cent in Q1FY26, supported by a favourable product mix, operating leverage and cost discipline. PAT increased 37 per cent to ₹25 crore. The quarter also marked a meaningful change in the company's geographical profile, with exports contributing 13 per cent of revenue, driven partly by its entry

CHOICE

1 YEAR INVESTMENT HORIZON

into the U.S. market.

Importantly, the growth was not entirely volume-driven. Management indicated that volume growth was around 5–6 per cent, with the balance largely reflecting higher aluminium prices. Despite elevated input costs, the company protected profitability through variable-price contracts with built-in price escalation clauses, while, for fixed-price contracts, it generally books raw materials alongside orders.

Renewable energy has become one of Dynamic Cables most important growth areas. Solar cable revenue reached around 20 per cent of revenue in Q1FY27, and management expects the segment to maintain a similar contribution for FY27, with a more meaningful increase expected after the new plant ramps up. This represents an important

shift in the company's business mix.

The company is currently commissioning a new manufacturing facility, with production expected to commence in September 2026. With an estimated capex of around ₹45 crore and the company's historical asset turnover of 6–7x, the facility provides significant scope for incremental revenue growth. The new capacity is expected to ramp up meaningfully from Q4FY27, with utilisation targeted at around 80–85 per cent within 18 months of commencement. A significant strategic development during Q1FY27 was Dynamic Cables' entry into the U.S. market. The company currently has approvals for HV, LV and MV cables. Management sees the U.S. as a substantial long-term opportunity due to the country's large power infrastructure market and significant replacement demand expected over the next 10–20 years. The company's order book stood at approximately ₹811 crore, providing healthy revenue visibility. Beyond its existing portfolio, the company is developing HTLS conductors and data-centre power cables. The company is also exploring EV infrastructure and other specialised applications.

The company's stock trades at around 28.8x P/E, broadly in line with the industry P/E of 28.5x and only modestly above its three-year median P/E of 27.9x. With a three-year sales CAGR of 21.4 per cent, profit CAGR of 38.9 per cent and PEG ratio of 0.74, the valuation appears reasonable relative to its growth profile.

Considering the company's strong execution, improving product mix, healthy financial profile, renewable-energy exposure and multiple avenues for capacity-led growth, we recommend a **BUY**.

Fineotex Chemical Ltd.

BUILDING SPECIALTY GROWTH INTO THE PORTFOLIO

HERE IS WHY

CrudeChem Adds a New Growth Engine

Oil & Gas Share on the Rise

Capacity Expansion Opens New Opportunities

India's specialty chemicals sector continues to offer growth opportunities, supported by increasing demand for customised formulations, sustainable chemistry and specialised industrial applications. Fineotex Chemical (Fineotex) has evolved from being primarily a textile chemicals manufacturer into a more diversified specialty chemicals company with exposure to textile processing, oil and gas, water treatment, and other performance chemical applications. The company has more than 470 product categories, over 1,600 SKUs, and a presence across approximately 70 countries.

Fineotex operates across multiple specialty chemical segments, with textile chemicals remaining an established business and oil and gas emerging as the key growth area following the acquisition of a 53.33 per cent controlling stake in U.S.-based CrudeChem Technologies Group. CrudeChem manufactures chemicals used across oilfield production, water treatment, and related industrial applications. Following the acquisition, Fineotex expanded CrudeChem's U.S. manufacturing capacity to approximately 1,48,000 MTPA. This complements Fineotex's manufacturing facilities at Mahape, Ambernath (both in Maharashtra), and Malaysia, with capacities of 36,500

LOW
PRICED SCRIPT

1 YEAR INVESTMENT HORIZON

MTPA, 76,000 MTPA, and 6,500 MTPA, respectively.

In Q1 FY27, approximately 65 per cent of consolidated revenue came from the oil and gas business, while international markets contributed approximately 77 per cent of total revenue, compared with 23 per cent from the domestic market. The key growth catalyst is the scaling up and integration of CrudeChem. Fineotex is focusing on improving capacity utilisation, operational efficiencies, technology transfer, and cost optimisation across the U.S. operations. Increasing demand for environmentally sustainable oilfield chemicals also provides an additional opportunity, particularly as specialised green chemistry products can command better realisations. At the same time, the company continues to strengthen its textile specialty chemicals portfolio through value-added formulations, technical textile applications, and

sustainable processing solutions. Water treatment is another emerging opportunity, supported by increasing industrial demand, water scarcity, and growing requirements for treatment and desalination chemicals.

Principal risks include volatility in raw material prices and changes in oilfield activity, which can influence demand and profitability. Execution risks associated with scaling the acquired U.S. business also remain important. Fineotex's increasing international exposure raises sensitivity to currency movements and overseas operating conditions. Fineotex reported FY26 revenue from operations of ₹772.23 crore, EBITDA of ₹134.75 crore, and PAT of ₹125.01 crore, translating into an EBITDA margin of approximately 17.45 per cent. In Q1 FY27, revenue from operations increased approximately 175 per cent year-on-year to ₹376.63 crore, EBITDA rose approximately 135 per cent to ₹59.14 crore, and PAT increased approximately 93 per cent to ₹48.21 crore. Gross margin stood at 35.42 per cent, while EBITDA margin came in at 15.70 per cent. ROCE stood at 25.56 per cent and ROIC at 33.06 per cent.

Fineotex shares trade at a P/E of 46.6x, above its five-year median P/E of 34x, indicating that the stock is currently trading at a premium to its historical valuation. The dividend yield stands at 0.27 per cent. The outlook is underpinned by the scaling up of CrudeChem, available capacity at the U.S. facility, increasing contribution from international operations, diversification beyond textile chemicals, and opportunities in sustainable specialty chemical applications, while valuation, execution, margin progression, and working capital remain key monitorables. Keeping the above factors in mind, we recommend **BUY**.

JK Paper Ltd. is one of India's leading paper and packaging solutions companies, with operations spanning paper, boards and packaging conversion. In Q1FY27, consolidated turnover increased 13 per cent YoY to ₹1,998.67 crore, while EBITDA rose 18 per cent to ₹320.90 crore. Profit after tax grew 63 per cent to ₹136.27 crore, supported by higher volumes, an improved product mix and stronger performance from the packaging business. During the quarter, the company acquired an additional 15.40 per cent stake in Borkar Packaging Private Limited, taking its total holding to 87.36 per cent. It also commenced production at its Hardwood Bleach Chemical Thermo-Mechanical Pulp plant at Unit CPM, Gujarat, strengthening backward integration. Promoter group holding had earlier increased by 3.31 percentage points to 52.94 per cent in March 2026 and remained unchanged in June 2026.

Spice Islands Industries Ltd. operates across food and beverages, hospitality and electric vehicle rental businesses, with food and beverages forming the largest revenue contributor. In Q1FY27, revenue from operations surged to ₹17.83 crore from ₹1.93 crore in Q1FY26, while total income stood at ₹18.72 crore. Profit after tax increased more than fourfold to ₹1.40 crore from ₹0.33 crore a year earlier, although it declined sequentially from ₹3.09 crore in Q4FY26. The food and beverages segment contributed ₹14.86 crore of revenue but reported a segment loss, while hospitality and EV rental remained profitable. The company has also entered into a 60:40 JV agreement with The Peace Mission Private Limited to develop and commercialise functional wellness beverages under the PEACE ROGERS brand, with Spice Islands holding 60 per cent. Considering strong YoY growth, diversification and the emerging wellness beverage opportunity, while factoring in sequential profit moderation, we recommend **BUY**.

(Closing price as of September 01, 2026)

NIFTY Index Chart Analysis

Nifty Near Make-or-Break Zone as Consolidation Extends

Last week, the Nifty 50 extended its decline for the third consecutive week, with trading activity remaining elevated compared to the previous week. The index also ended its two-month winning streak, falling 1.24 per cent in August. The month marked the introduction of the new Closing Auction Session (CAS) mechanism. During August, NSE's total monthly equity derivatives turnover stood at ₹34.48 lakh crore, the lowest level recorded in calendar year 2026 so far. The moderation in derivatives activity can partly be attributed to behavioural changes following the implementation of CAS, as market participants appeared to reduce their exposure, particularly during the final half-hour of trading.

Roadmap for the Next 15 Days			
Ideas	Nifty Levels	Action to be Initiated	Probable Targets
Resistance for the medium-term	24,209 — 24,244	Close above the level of 24,209 — 24,244 would be positive for Nifty	24,400 — 24,670
Support for the medium-term	23,950 — 24,000	Any slip below 23,950 — 24,000 on a closing basis would result into resumption of down move.	23,824 — 23,600

largely unchanged from the previous fortnight, with the index continuing to consolidate within a defined range. The 23,950–24,000 zone continues to act as a crucial support area, while a cluster of important moving averages on the upside is limiting any meaningful recovery. The index remains positioned between these key levels, and a decisive move on either side will be required to establish the next directional trend.

average placed at 24,414, the 200-DMA at 24,636, and the 50-week moving average at 24,691. The close proximity of these levels creates a strong resistance zone between 24,400 and 24,750, making it an important area to watch for any potential breakout. On the downside, the 23,900–24,000 region remains a key support zone. Additionally, the July 27 gap area between 23,892 and 23,824 could act as another support zone in case of further selling pressure.

On the immediate upside, resistance is seen in the 24,209–24,244 range. This zone aligns with the 50-DMA and the downward-sloping trendline drawn from the August 3 swing high. A sustained breakout above this level could improve sentiment and push the index towards its 20-DMA, currently positioned near 24,312.

From a technical perspective, the Nifty 50 closed below its 10-week moving average and continues to trade below its short-term moving averages, including the 20-DMA and 50-DMA. The 20-DMA remains in a declining trend, while the 50-DMA has started flattening, indicating a lack of strong directional momentum. However, the index managed to find support near its 20-week moving average, which is currently placed around 24,021.

The broader technical setup remains

A breakdown below the 23,950–24,000 zone could lead to further weakness, while a sustained move above the 24,400–24,750 region would indicate renewed strength. Until either of these levels is breached, the ongoing range-bound structure is likely to continue.

Pattern analysis also suggests that the consolidation phase remains intact. The Nifty is currently trading below a significant long-term moving average cluster, with the 100-week moving

With the index still trading within a narrow range, aggressive directional bets may carry higher risk. Fresh positions should remain selective and focused on stock-specific opportunities rather than broad market exposure. Similarly, short positions should be avoided as long as the 23,950–24,000 support zone remains intact. For the coming fortnight, a measured approach with controlled position sizing and patience for a confirmed breakout or breakdown would be a prudent strategy.

STOCK RECOMMENDATIONS

OBEROI REALTY LTD BUY CMP ₹1,880.00

BSE Code : 533273 | Target 1 ₹1,950 | Target 2 ₹1,990 | Stoploss....₹1,820 (CLS)

Oberoi Realty Ltd. is one of India's leading real estate development company, headquartered in Mumbai. It is focused on premium developments in the residential, office space, retail, hospitality and social infrastructure verticals. In the real estate space, Oberoi Realty is an established brand with an impeccable track record. Oberoi Realty has found support near the rising trendline drawn by connecting the June and August lows. This support zone also aligns with the rising 20-DMA, adding strength to the technical setup.

On Tuesday, the stock formed a bullish candle after holding this support area, indicating renewed buying interest near the trendline and moving-average support. The stock continues to

trade above its 20-DMA, 50-DMA, 100-DMA and 200-DMA. More importantly, these moving averages remain aligned in a favourable sequence, which keeps the broader trend positive. The 14-period RSI on the weekly time frame is in bullish territory.

Going forward, a sustained move above the ₹1,882-1,885 zone could support further upside towards ₹1,950, followed by ₹1,990. On the downside, ₹1,820 can be kept as the stop-loss level

VIMTA LABS LTD BUY CMP ₹661.35

BSE Code : 524394 | Target 1 ₹700 | Target 2 ₹720 | Stoploss....₹630 (CLS)

Vimta Labs Ltd., originally established in 1984 as a Partnership firm, is India's most comprehensive contract research and testing organization, providing a wide range of services to pharmaceutical, biopharmaceutical, food, consumer goods, electronic, electrical, agrochemical, medical device, power, cement, oil & gas, ores & minerals, infrastructure and many other industries, government organisations as well as other industry participants.

Vimta Labs is approaching a potential breakout from its channel pattern. The stock recently found support near the 50-DMA, which also coincided with the lower boundary of the channel and the rising trendline. From there, it staged a sharp recovery accompanied by strong volumes, indicating improved participation and strengthening buying interest.

The stock is currently trading above its key moving averages, including the 20-DMA, 50-DMA, 100-DMA and 200-DMA, which keeps the broader technical structure favourable. The 14-period RSI has also moved above its previous swing high and entered bullish territory, adding strength to the recent price move.

Going forward, a sustained move above the ₹667-670 zone could confirm the breakout and open the way for ₹700-720 in the short to medium term. On the downside, ₹630 can be considered an important risk level on a closing basis.

Urban Company

From Growth Story to Portfolio Contender

With its core India business turning profitable and newer bets such as InstaHelp expanding the growth runway, Urban Company is entering a phase where operating leverage could reshape its earnings profile

Urban Company has entered a phase in which the market is beginning to value the economics of its platform rather than merely its growth potential. After remaining well below its earlier peak for much of 2026, the stock rallied sharply to around ₹169 on August 24, 2026 rising by 30 per cent in one month.

Q1 FY27 helps explain the change in sentiment. Consolidated net transaction value, or NTV, rose 42 per cent year-on-year to ₹1,465 crore, revenue increased 44 per cent to ₹528 crore and orders jumped 79 per cent to 1.32 crore. More importantly, the established businesses excluding InstaHelp generated adjusted EBITDA of ₹67 crore, up 116 per cent, showing that the mature platform is beginning to convert scale into profit.

The consolidated picture is more complicated because InstaHelp lost ₹132 crore at the adjusted EBITDA level in the same quarter. Urban Company is operating at two speeds: its mature businesses are generating profit while its largest new initiative is consuming substantial capital. It is no longer simply a growth-at-all-costs internet business, but it is not yet a mature profit compounder. Long-term value depends on whether the profitable core can expand while the newer businesses move down the investment curve.

A Managed Marketplace Built Around Trust

Founded in 2014, Urban Company operates a technology-enabled managed marketplace connecting consumers with service professionals across beauty and wellness, home cleaning, appliance repair, AC servicing, plumbing, electrical work, carpentry and other household services.

Unlike a simple directory, Urban Company manages professional onboarding, training, pricing, quality monitoring, digital payments, support and service assurance. The model is operationally intensive, but it gives the company greater control over the customer experience.

The problem in home services is not just finding a technician. It is knowing whether that person will arrive on time, charge fairly, perform the work correctly and accept responsibility if something fails. Urban Company attempts to replace this uncertainty with verification, standardised pricing, digital booking and a formal grievance mechanism.

Professionals receive demand, training, payments and an operating system; consumers receive convenience and accountability. As the network becomes denser, utilisation,

availability and repeat usage can improve together. Technology, training infrastructure and support need not rise in direct proportion to every order, allowing revenue to grow faster than the fixed and semi-fixed cost base. Q1 FY27 suggests that this leverage is already visible in core India.

Four Businesses at Different Stages of Maturity

India Consumer Services is the foundation of the investment case. Q1 FY27 NTV increased 29 per cent year-on-year to ₹1,056 crore, revenue stood at ₹356 crore and adjusted EBITDA reached ₹73 crore. Its adjusted EBITDA margin on NTV improved to 6.9 per cent from 5.2 per cent in Q1 FY26.

The implied take rate was 33.7 per cent, meaning every ₹100 of consumer transaction value produced approximately ₹33.70 of recognised revenue. The ₹73 crore of adjusted EBITDA was about 20.5 per cent of segment revenue, evidence that the established marketplace can generate meaningful profit after absorbing its operating cost base.

Growth was broad-based. Annual transacting users rose around 21 per cent to approximately 82 lakh, while spend per user increased about 7 per cent. NTV outside the top 10 metropolitan markets grew faster at 36.2 per cent. The company is therefore adding customers, deepening engagement and extending its geographical reach simultaneously.

International could become a second profit engine. Q1 FY27 NTV increased 76 per cent to ₹237 crore, or 58 per cent in constant-currency terms, revenue reached ₹65 crore and the segment moved into adjusted EBITDA profitability. UAE demand softened temporarily in April amid the Middle East conflict but recovered during May and June, according to management.

Urban Company can reuse technology, recruitment, training and quality-control capabilities overseas, although labour regulations, consumer behaviour and competition differ by country. Profitable growth is early evidence that the model may travel beyond India rather than becoming another source of cash burn.

Native represents a different strategic move. Instead of facilitating only a service, Urban Company is designing and selling household products. In Q1 FY27, Native generated NTV of ₹119 crore and revenue of ₹95 crore, with net revenue growing 60 per cent year-on-year. Its adjusted EBITDA loss narrowed to ₹9 crore, or 7.3 per cent of NTV, from 11.4 per cent a year earlier.

A water purifier or smart lock can create revenue through its sale, installation, maintenance, consumables and eventual replacement, extending the customer relationship. However, Native introduces inventory, sourcing, warranty and working-capital requirements. It must therefore prove that growth can

produce acceptable margins and returns on capital.

Urban Company's reported growth becomes easier to interpret when its four business engines are separated.

Segment (Q1 FY27)	NTV	Revenue	Adjusted EBITDA position
India Consumer Services (excluding InstaHelp)	₹1,056 Cr.	₹356 Cr.	₹73 Cr.
International	₹237 Cr.	₹65 Cr.	₹3 Cr.
Native	₹119 Cr.	₹95 Cr.	Loss of ₹9 Cr.
InstaHelp	₹53 Cr.	₹11 Cr.	Loss of ₹132 Cr.

InstaHelp Is Both the Opportunity and the Main Risk

InstaHelp is the most consequential new initiative because it changes usage frequency. A household may book AC servicing once or twice a year, while domestic help can be required daily. Success could turn Urban Company from an occasional-use application into a household utility.

The scale-up has been rapid. InstaHelp completed 38.2 lakh orders in Q1 FY27, an increase of 43 per cent quarter-on-quarter, while NTV rose 32 per cent sequentially to ₹53 crore. The segment nevertheless incurred an adjusted EBITDA loss of ₹132 crore as the company spent on customer acquisition, professional onboarding, incentives and network expansion.

Implied NTV was about ₹139 per order, against an adjusted EBITDA loss of ₹346 per order. The measures are not directly comparable, but they illustrate the intensity of investment. Spending above present transaction value can make sense during market creation only if repeat usage, density and partner productivity improve substantially.

There is early progress: adjusted EBITDA loss per order declined from ₹447 in Q4 FY26 to ₹346 in Q1 FY27, improving almost 23 per cent. That suggests density is beginning to help, although the reduction must continue before a credible path to profitability is established.

Order growth alone is the wrong success measure. Investors need evidence that customers repeat without rising incentives, professionals complete more paid jobs per hour, acquisition cost is recovered over the user's lifetime and loss per order falls as each micro-market matures.

If these conditions are met, frequent engagement could lower the effective cost of cross-selling other services and Native products. If the category instead needs persistent subsidies, it could absorb core cash without creating durable value.

How the Marketplace Makes Money

NTV is substantially higher than revenue because it represents the total value transacted through the platform, while revenue is Urban Company's recognised economic income. In a

simplified ₹1,000 India Consumer Services transaction, the full amount is NTV and about ₹337 is revenue at the 33.7 per cent take rate. From that revenue, the company must meet partner-related costs, payment charges, service assurance, support, technology, marketing and overheads.

This explains why high NTV growth does not automatically create profit. A healthy marketplace must combine increasing transaction value with stable monetisation, improving contribution economics and a cost base that grows more slowly than revenue. India Consumer Services is now displaying that combination. NTV rose 29 per cent, while its adjusted EBITDA margin on NTV expanded by 170 basis points year-on-year to 6.9 per cent.

Repeat and cross-category bookings are valuable because they spread the original customer-acquisition cost across more revenue. Density also lets professionals complete more paid assignments with less idle time, while Urban Company fulfils more demand without recruiting supply at the same rate. It can therefore improve customer lifetime value, partner earnings, availability and unit economics together.

Where Further Operating Leverage Can Come From

Further profitability can come from higher core order density, greater customer lifetime value and expansion beyond the largest metros. The rise in core margin from 5.2 per cent to 6.9 per cent of NTV shows the potential, while the simultaneous increase in users and spending per user supports the quality of growth. Smaller cities may initially have lower density and different price points, so comparable service standards and economics still need to be demonstrated. International and Native can add earnings and diversification if they progress without disproportionate capital.

The fifth and largest swing factor is InstaHelp. A reduction in its quarterly loss would flow directly into consolidated EBITDA, provided the core remains healthy. Management has guided for consolidated adjusted EBITDA breakeven by Q3 FY28 and adjusted EBITDA of ₹1,000 crore by FY31. Achieving those targets will require more than continued core growth; it will require a steep improvement in the economics of the newer businesses, especially InstaHelp.

The Structural Opportunity in Home Services

India's home-services market remains fragmented and largely informal. Urbanisation, nuclear families, rising incomes, digital payments and the value placed on convenience support organised providers. The deeper opportunity, however, is a change in how households purchase services.

A reliable digital experience can move existing spending from unorganised providers to a platform, but it may also expand

consumption. Customers who previously postponed maintenance, avoided certain services or relied on do-it-yourself solutions may purchase more frequently when pricing, quality and accountability become predictable. The addressable opportunity therefore includes both formalisation and potential market expansion.

Trust matters because professionals enter the customer's home. Training, background checks, ratings, support and service guarantees can create a stronger advantage than the app itself. Urban Company is ultimately trying to own a broader household relationship across repairs, maintenance, beauty, products and potentially daily domestic help, creating a recurring ecosystem with higher engagement.

Competition and the Limits of the Moat

Urban Company competes with neighbourhood professionals, organised service providers and newer instant-service platforms. The software itself is not a strong barrier because a competitor can build an application. The harder assets to reproduce are the professional network, training infrastructure, quality-control systems, customer trust, transaction data and local fulfilment density accumulated over time.

Even these advantages do not create an absolute moat. Consumers can switch platforms, and professionals may work across multiple platforms. Traditional switching costs are therefore limited. Urban Company's strongest potential defence is density within individual micro-markets.

A dense network can improve availability and reliability while giving professionals more paid work and reducing idle time. This is especially important for InstaHelp because frequent, low-ticket services require tightly matched local demand and supply. A national brand matters, but the economics are won neighbourhood by neighbourhood.

Competition could still weaken returns if rivals subsidise customers and professionals for extended periods. Urban Company may then have to spend more merely to defend share, delaying the point at which density translates into profit. The company must therefore distinguish growth that builds a durable network from growth purchased through incentives that disappear when subsidies are withdrawn.

Key Risks and the Valuation Test

The most immediate risk is a delay in consolidated profitability. India Consumer Services may continue to grow profitably while investments elsewhere keep group-level earnings weak. InstaHelp's ₹132 crore quarterly adjusted EBITDA loss shows how quickly a new initiative can consume the profit generated by mature operations.

Execution depends on customer-acquisition efficiency and partner retention. Lifetime customer contribution must exceed acquisition and service costs. High partner churn would require repeated recruitment and training, while poor

Intense cleaning (2 bathroom)

Roll-on waxing (Full arms, legs & underarms)

Intense cleaning (3 bathroom)

Plumber consultation

Water Purifier / RO Service & Repair

utilisation could damage professional earnings, availability and service quality.

Capital allocation is another concern as Urban Company pursues geographical expansion, International, Native and InstaHelp simultaneously. It ended Q1 FY27 with approximately ₹2,019 crore in cash and treasury investments, providing a meaningful cushion. Investors must still assess whether that cash is creating durable earning power or financing prolonged losses.

Valuation leaves limited room for complacency. At ₹169 per share and a market capitalisation of about ₹26,100 crore as of August 24, 2026, the market is assigning substantial value to profits that have not yet been delivered. The market capitalisation is roughly 26 times management's FY31 adjusted EBITDA target of ₹1,000 crore. If the current cash balance is deducted, the simplified multiple falls to about 24 times, before considering future cash burn, debt, dilution, taxes, capital expenditure or changes in cash by FY31. This is not a conventional valuation multiple, but it highlights how much execution is already embedded in the price.

Conventional near-term earnings multiples are therefore of limited use. A more useful framework is to value the profitable core separately, assign conservative value to International and Native, and treat InstaHelp as an option whose value rises only as its unit economics improve. This avoids giving full credit today for management's FY31 ambition. It also prevents consolidated losses from obscuring the earning power already visible in India Consumer Services. Each quarter should reduce, rather than increase, the assumptions required by the valuation.

The bull case requires core India margins to expand, International to sustain profitable growth, Native to reach breakeven and InstaHelp to convert order growth into improving contribution economics. Together, these could create multiple profit engines.

In the bear case, core margins plateau, acquisition costs rise and InstaHelp remains loss-making. Cash burn would continue, the FY28 breakeven target could slip and distant FY31 earnings could command a lower valuation.

Investment Recommendation

Urban Company has demonstrated that its core marketplace can grow profitably. India Consumer Services generated ₹73 crore of adjusted EBITDA on ₹1,056 crore of NTV in Q1 FY27, with its margin improving to 6.9 per cent from 5.2 per cent. International is profitable and Native is narrowing its losses, creating more than one potential earnings engine.

The remaining uncertainty is concentrated in InstaHelp. Its ₹132 crore quarterly adjusted EBITDA loss is substantial, but the reduction in loss per order from ₹447 to ₹346 indicates that density is improving economics. Urban Company's ₹2,019 crore cash and treasury balance provides capacity to fund this investment while the profitable core expands.

At around ₹169, the valuation discounts future success and is not inexpensive. However, Urban Company's leadership in an underpenetrated market, improving core margins, geographical reach and opportunity to increase household usage frequency support a constructive three-to-five-year view. The company may still be growing strongly when it reaches management's FY31 adjusted EBITDA objective.

Urban Company therefore merits a Buy recommendation for long-term investors with a three-to-five-year holding period and a high-risk classification. Fresh investors should accumulate in stages instead of committing their full allocation after the recent rally. Existing investors can hold and use meaningful corrections for gradual accumulation, subject to portfolio allocation. The recommendation remains supported while core India protects profitability, International remains profitable, Native approaches breakeven and InstaHelp records a sustained reduction in loss per order. It should be reassessed if core margins contract materially, new-business losses widen without better unit economics or the Q3 FY28 consolidated adjusted EBITDA breakeven target moves significantly further away.

Urban Company has proven that its established marketplace can produce operating profit. The next phase is about using that foundation to build a broader household-services ecosystem. Profitable core operations, strong transaction growth, improving leverage and high-frequency optionality support a long-term **BUY**, while staggered accumulation provides a prudent way to manage near-term volatility.

MID-CAPS 2026

Mid-caps at Record Highs: What Comes Next?

Mid-caps have mastered the art of surprising investors. They can turn overlooked businesses into market favourites, deliver explosive returns and, just as quickly, expose the risks of paying too much for growth. With the Nifty Midcap 150 near record highs, the real question is no longer whether the rally has worked, but where the next opportunity lies and what investors should do from here

For years, mid-cap stocks have occupied a fascinating position in India's equity market. They are neither as established as large-caps nor as unpredictable as many small-caps, yet they often offer something investors find difficult to ignore: the possibility of participating in the next phase of a company's growth before it becomes a mainstream large-cap story. That promise has attracted investors in large numbers.

If you look at the past few years, many companies have emerged from a difficult period with healthier balance sheets, stronger cash flows and improving operating conditions. Domestic demand remained supportive, government spending strengthened several industries and private-sector capital expenditure began showing signs of a broader revival. At the same time, retail participation and systematic investment flows created a powerful source of domestic liquidity. The combination was favourable for mid-caps.

The Nifty Midcap 150 index has delivered an impressive 5-year annualised return of around 17.6 per cent. Even in 2026, mid-caps have continued to attract strong investor interest. When geopolitical tensions in the Middle East triggered a sharp market correction in March 2026, mid-cap stocks were not spared and came under significant pressure.

Yet, the segment demonstrated remarkable resilience, staging a swift V-shaped recovery and gradually moving towards record highs, even as the benchmark indices lacked a similar degree of optimism.

The Mid-cap Rally Has Two Stories

Does this mean that all mid-cap stocks have recovered and performed well? The answer is a clear no. While some of the best performers have more than doubled investors' wealth over the past year, several others have struggled to recover and have eroded significant investor wealth.

This distinction matters because, while the Nifty Midcap 150 index may be at an all-time high, performance at the individual stock level has been far more measured and uneven.

Nifty 50 vs. Nifty Midcap 150

Top 5 Mid-Cap Performers

Company Name	Latest Market Cap. (₹ Cr.)	1 Year Returns (%)
Vodafone Idea Ltd.	1,62,081	124.44
Multi Commodity Exchange of India Ltd.	83,663	117.76
Laurus Labs Ltd.	1,03,940	117.23
Apar Industries Ltd.	74,792	116.49

PI Industries Ltd.	37,381	-33.77
SJVN Ltd.	25,646	-33.64

Data as on August 26, 2026

A recovery-led rally may not continue indefinitely at the same pace. Once earnings normalise and valuations re-rate, the market begins asking a more demanding question: What comes next? That is where the current mid-cap story becomes more interesting. The index reaching a record high does not necessarily mean that the entire segment has become expensive or that the opportunity has disappeared.

It simply means that investors now need to distinguish between companies that have already enjoyed a significant recovery and those that still have a credible runway for sustainable earnings growth. Instead of broad-based appreciation, investors could see a market where companies with strong balance sheets, structural demand drivers, pricing power, execution capabilities and visible earnings growth continue to attract capital, while businesses whose valuations have moved ahead of their fundamentals struggle to keep pace.

Valuations: Growth Comes at a Price

The easiest way to become enthusiastic about a mid-cap company is to look at its growth opportunity. The harder task is to determine how much of that opportunity is already reflected in the share price. While the Nifty Midcap 150 is trading below its one-year median PE of 32.6x, its current valuation of around 30x still leaves little room to call the segment cheap in absolute terms. But the question investors should be asking is not, "Are mid-caps expensive?" The better question is, "Which mid-caps are expensive relative to the growth they can realistically deliver?"

The premium can be justified when companies deliver superior earnings growth, improve return ratios and expand their addressable markets. But valuation creates an invisible hurdle. Suppose a company grows its earnings by 20 per cent. If investors were already expecting that growth and had assigned the stock a premium valuation, the share price may not

necessarily rise by 20 per cent. This is one of the most important lessons for investors entering the mid-cap segment today.

Business growth and stock-market returns are related, but they are not the same thing. A company can grow rapidly while its stock delivers mediocre returns if the valuation multiple contracts. Conversely, a company with modest earnings growth can generate strong returns if the market begins to recognise an underappreciated improvement in its business. This is why valuation dispersion within the mid-cap universe deserves attention.

Data as on August 26, 2026

The Growth Drivers for Mid-caps

The easy part of the recovery may already be behind us, and the next leg of growth is unlikely to be driven by optimism alone. It will need stronger earnings, improving business fundamentals and the emergence of new growth opportunities. One of the biggest advantages for the mid-cap segment is its exposure to some of the structural themes shaping India's economy. Unlike large companies, many mid-caps operate in businesses where rising formalisation, increasing consumption, infrastructure development and manufacturing expansion can translate into faster revenue growth. If these themes continue to play out, they could create a favourable environment for companies that are still in the early stages of their growth journey. Below are some of the major factors that investors should keep an eye on.

Special Report

The Financialization Opportunity

Financialization could emerge as one of the most important structural growth drivers for mid-caps, with financial services accounting for nearly one-fourth of the Nifty Midcap 150's constituents. Rising incomes, increasing formalisation, digital adoption and greater awareness of financial products are steadily expanding India's financial services ecosystem. The opportunity extends beyond traditional banking, creating room for mid-sized companies across lending, insurance, asset management, wealth management and capital-market services.

Credit growth could remain an important catalyst. As households become more affluent and businesses expand, demand for housing, vehicle, consumer and business loans is likely to increase. Mid-sized lenders with strong presence in specific customer segments or underpenetrated geographies could benefit from this expansion, particularly as financial services penetrate deeper into Tier-2 and Tier-3 cities. Digital adoption is further accelerating this transition.

Mobile payments, digital onboarding and technology-led credit assessment are allowing financial institutions to reach customers at lower costs and serve previously underserved markets. At the same time, the growing participation of retail investors is supporting demand for mutual funds, systematic investment plans, insurance and wealth-management products. For mid-caps, the opportunity lies in capturing this expanding customer base while maintaining disciplined growth. Companies with strong distribution, improving technology capabilities, healthy asset quality and efficient operations could be well-positioned to benefit from India's ongoing financialization.

The Expanding Consumption Story

Consumption could provide another structural source of growth. India's rising incomes, urbanisation, financialization and expanding middle class are gradually changing the nature of domestic consumption. The opportunity is no longer restricted to large metropolitan centres. Mid-sized companies operating in areas such as consumer durables, retail, travel, automobiles and lifestyle products could benefit as consumption spreads into smaller cities and towns.

Increasing digital penetration is also allowing businesses to reach customers beyond traditional geographic boundaries. This broadening of the consumption base could be particularly favourable for mid-caps because several of them are still expanding their distribution networks and gaining market share from smaller unorganised competitors or established players with slower growth.

The Manufacturing Push

India's push to strengthen its manufacturing capabilities could remain an important growth driver for mid-caps. Government initiatives aimed at boosting domestic manufacturing, reducing import dependence and encouraging investments in strategic industries are creating opportunities across sectors. Capital goods, engineering, electronics, defence, industrial automation,

electrical equipment and specialty manufacturing are some of the areas where mid-sized companies could benefit from rising capital expenditure.

The opportunity is not limited to companies directly supplying government projects. As private-sector investment picks up, the entire industrial ecosystem, including component manufacturers, engineering companies and specialised suppliers, could see stronger demand. The real opportunity could emerge when capacity expansion moves beyond a few large companies and starts spreading across the broader industrial ecosystem.

Mid-caps, with their narrower business focus and ability to operate in specialised niches, are well placed to participate in this expansion. Government spending will remain another important pillar. India's infrastructure requirements are enormous, spanning roads, railways, power, urban infrastructure, logistics and renewable energy. Continued public investment can create a multiplier effect by improving demand for construction, engineering, equipment and related services.

The New-Age Growth Themes

Some of the most interesting opportunities could come from sectors where policy support and structural demand are working together. Defence is one such area. Higher domestic procurement, a focus on self-reliance and rising export ambitions have created a larger opportunity for Indian defence manufacturers and their suppliers. Similarly, electronics manufacturing, semiconductors and related component ecosystems could benefit from efforts to establish deeper domestic supply chains.

The energy transition is another long-term theme, with opportunities emerging across renewable power, transmission, energy storage, electrical equipment and related technologies. However, these themes should not be treated as automatic investment opportunities. Government support can create an addressable market, but individual companies still need to demonstrate execution, profitability and sustainable competitive advantages.

The Cyclical Recovery Opportunity

Not every opportunity will come from long-term structural themes. Some of the next winners could emerge from cyclical sectors that are currently underappreciated. As domestic economic activity improves, sectors such as chemicals, metals, automobiles, and building materials could experience an improvement in demand and margins.

For companies that have already spent the last few years repairing balance sheets and improving operational efficiency, even a moderate recovery in their end markets could result in disproportionately stronger earnings growth. But cyclical opportunities also demand discipline because peak-cycle earnings can make valuations appear deceptively attractive.

The Earnings Test: What Should Investors Watch?

The next leg of the mid-cap journey will ultimately have to pass the earnings test. Valuation expansion can lift stock prices for a while, but sustainable returns eventually need sustainable earnings growth. With valuations still elevated across parts of the mid-cap universe, investors may have less patience for earnings disappointments. The opportunity, therefore, may not lie in buying the entire segment and waiting for another broad-based rally. It could increasingly be about identifying businesses where structural growth, cyclical recovery and improving execution converge. Interestingly, the next winners may not necessarily be the stocks that have already delivered the biggest returns. They could be companies where the market is yet to fully appreciate how significantly earnings can improve over the next few years. For investors navigating this phase, five factors deserve particular attention.

- **First**, earnings visibility. Companies with a credible path to sustained earnings growth are likely to be better placed than those relying on one-off gains or a favourable quarter.
- **Second**, balance-sheet strength. Growth is valuable only when it does not come at the cost of excessive leverage. Companies with healthier balance sheets have greater flexibility to invest through different phases of the cycle.
- **Third**, cash-flow conversion. Reported profits tell only part of the story. Businesses that consistently convert earnings into cash generally have greater financial resilience and more room to fund future growth.
- **Fourth**, valuation discipline. Even an outstanding business can deliver disappointing investment returns when purchased at an unrealistic price. Growth expectations need to be weighed against the multiple investors are paying for them.
- **Finally**, management quality. As mid-sized companies scale up, capital allocation becomes increasingly important. Prudent decisions on expansion, acquisitions and debt can determine whether growth ultimately creates or destroys shareholder value.

These may appear to be familiar principles, but they become particularly important when the market shifts from a broad-based rally to a more selective phase. The next mid-cap cycle could reward not simply growth, but growth that is visible, profitable, cash-generative and available at a sensible price.

The Road Ahead

So, where does that leave the mid-cap story? Perhaps the answer lies somewhere between exuberance and caution. The segment has already experienced a powerful re-rating, and the fact that the Nifty Midcap 150 is back near record levels while one-year gains have remained relatively modest suggests that the market has spent considerable time digesting its earlier gains. That is not necessarily a warning sign. It could, in fact, be a healthy pause.

If corporate earnings continue to improve, valuations become more reasonable relative to growth and India's structural investment and consumption story remains intact, mid-caps could enter their next phase from a stronger fundamental base. The opportunity, however, is likely to become increasingly selective. This is where the distinction between a good company and a good investment becomes important.

The next winners may not necessarily be the stocks that have already delivered the biggest returns. They could be businesses quietly expanding capacity, gaining market share, improving return ratios, strengthening balance sheets and building competitive advantages that are not yet fully reflected in their long-term earnings potential. The mid-cap universe is large enough to offer both possibilities. Some companies can evolve into tomorrow's market leaders, while others may struggle with debt, competition or an inability to convert growth opportunities into sustainable profits. The investor's challenge is to tell the two apart.

For investors with a long-term horizon, that is not a reason to step away from mid-caps. It is a reason to look more closely at what they own, why they own it and what expectations are already embedded in the price. To help our readers and investors make more informed decisions, we present this special data bank featuring mid-cap companies and their financial performance over the past five years. Stay tuned for more such insights as we uncover emerging opportunities across market capitalisations and sectors.

Research Methodology

To come up with a ranked list of mid-cap stocks, we took into consideration five crucial parameters. The first includes market capitalisation. The remaining parameters are obtained from the Profit & Loss Account and include Sales, Operating Profit and Net Profit. We also considered the PAT margin for ranking the stocks as it indicates how efficient a company has been in converting the given sales into profits. Each parameter was then ranked by awarding it a carefully determined weightage based on its significance.

We then segregated the companies into three categories as follows:

- **Turnaround Financials:** Companies that shifted from FY25 losses to FY26 profits.
- **Improving Financials:** Companies that significantly reduced their losses in FY26 compared with FY25, signaling a potential recovery ahead.
- **Thriving Financials:** Profitable mid-cap companies that sustained growth in FY26.

A consolidated ranking was done in each category to arrive at the list. All the raw financial data is sourced from Accord Fintech and price-related information is as of August 21, 2026.

When Bonds Speak, Equities Listen

At USD 160.7 trillion, the global bond market is now larger than the entire equity market. With the U.S. 10-year yield at 4.68 per cent, India's G Sec yield at 6.87 per cent and Japan's 30-year yield near record highs, bonds are sending a powerful signal. As America's annual interest bill crosses USD 1 trillion, equities can no longer afford not to listen

The Asset Class Equity Investors Almost Always Ignore

Ask any Indian equity investor what they are watching most closely, and the answers tend to follow a familiar pattern. Earnings season. Crude oil. Geopolitics. The RBI's next policy decision. The Nifty's technical levels. These are legitimate concerns, but they share a common characteristic, they sit on top of a foundation that most investors never examine directly. That foundation is the bond market.

Bonds determine the price of money. They set the rate at which

governments borrow, the rate at which corporations finance themselves, and the rate at which future cash flows are discounted to arrive at the present value of any asset. When bond yields are low, future earnings are worth more today. When bond yields rise, future earnings are worth less. This mathematical relationship sits beneath every equity valuation in the world, whether investors acknowledge it or not.

For most of the past decade, low bond yields were the invisible hand supporting equity valuations. Central banks suppressed short-term rates to near zero and flooded financial systems with liquidity. Long-term government bond yields fell to

Cover Story

historic lows in several major economies. Investors who moved away from bonds into equities were not merely chasing better returns, they were rationally responding to an environment where bonds offered almost nothing. High P/E multiples for equities were, to a meaningful degree, a logical response to a world where the alternative was a government bond yielding 1 or 2 per cent.

That world is gone. Government bond yields in most major economies have reset materially higher from their lows. The U.S. 10-year Treasury yield, which touched 0.52 per cent in August 2020, now stands at 4.68 per cent. Japan's 30-year government bond yield, which had been suppressed under yield curve control for years, is now near-record highs. In India, the 10-year G-Sec yield has moved from a pandemic low of approximately 5.89 per cent to 6.87 per cent today, even as the RBI has cut its policy repo rate to 5.25 per cent. Long-term bond yields are sending a different signal than short-term yields, and equity investors should pay attention.

This story explains what today's bond market means for equity investors in India and globally. It looks at why the bond market matters and how rising yields affect stock valuations. It also examines which sectors are most vulnerable and which may be more resilient. Finally, it assesses whether Indian equities are cheap or expensive compared with risk-free returns. The conclusion may surprise investors who have largely ignored bonds over the past decade.

The Bond Market Is Bigger Than the Equity Market and Most Investors Don't Know It

To understand how bond yields affect stock valuations, investors must first understand the size of the global bond market. Many equity investors see bonds as complex investments mainly used by insurance companies, pension funds and central banks. However, the bond market is huge and plays a key role in setting prices across financial markets. It cannot be ignored.

Market	Size (2025)
Global fixed-income securities outstanding	\$160.7 trillion
Global equity market capitalisation	\$157.8 trillion
U.S. fixed-income market	\$61.2 trillion
U.S. equity market	\$68.9 trillion
U.S. Treasury securities outstanding (July 2026)	\$31.5 trillion
U.S. corporate bonds outstanding	\$11.7 trillion
India government debt outstanding (Mar. 2026)	₹202.4 trillion
India corporate bond market outstanding	₹59 trillion
India total bond market (approx.)	₹260+ trillion

In 2025, global fixed-income securities outstanding reached USD 160.7 trillion, according to SIFMA's Capital Markets Fact Book, slightly exceeding global equity market capitalisation of USD 157.8 trillion. The United States alone accounted for USD 61.2 trillion, or 38.1 per cent of global fixed-income securities

outstanding, making it the world's largest bond market by a considerable margin. The U.S. Treasury market alone stood at USD 31.5 trillion outstanding as of July 2026, while corporate bonds added another USD 11.7 trillion.

India's bond market, while far smaller in absolute terms, has expanded rapidly. As of March 2026, India's corporate bond market had reached approximately ₹59 trillion, up from roughly ₹17.5 trillion a decade earlier, a compound annual growth rate of approximately 12 per cent. Outstanding central government securities, Treasury bills, State Development Loans and related government debt instruments stood at approximately ₹202.4 trillion as of March 2026, according to CCIL. Together, India's government and corporate debt markets represent a fixed-income ecosystem of more than ₹260 trillion, a number that is almost half of India's total equity market capitalisation.

These numbers matter because they explain why the bond market sets the price of capital. When governments need to borrow at this scale, they must offer yields sufficient to attract investors. Those yields become the reference point, the risk-free rate, against which every other asset, including equities, is priced. A 100-basis-point move in Treasury yields, applied to a USD 31.5 trillion outstanding stock of government debt, means the interest burden on that debt changes by USD 315 billion annually. Applied to India's ₹202 trillion of government debt, even a 25-basis-point move means ₹50,500 crore of additional annual interest cost. These are not abstract numbers. They are the reason government borrowing decisions, fiscal deficits and bond supply directly influence the price every investor pays for risk.

Why the Bond Market Is the Foundation of All Asset Prices

Government bond yields represent the risk-free rate, the return available without taking credit or equity risk. Every other asset, corporate bonds, equities, real estate and infrastructure, must be priced relative to this benchmark.

When the risk-free rate rises, the required return from all other assets rises too, either through higher yields on corporate bonds or through lower equity valuations. A company whose stock was reasonably priced at 25x earnings when the risk-free rate was 4 per cent may be expensive at 25x when the risk-free rate is 7 per cent. Bond markets are not a distant technical world. They are the pricing mechanism underneath every equity valuation.

What Is a Bond Yield and Why Should an Equity Investor Care?

A bond is a promise made by a government or company. It agrees to pay regular interest and return the original amount at maturity. The bond's yield is the annual return an investor can earn by buying it at the current price and holding it until maturity.

Bond prices and yields move in opposite directions. When bond prices fall, yields rise. When prices rise, yields fall. If investors sell bonds due to concerns about inflation, government debt or rising interest rates, yields increase. This can affect borrowing costs and investment valuations across the

financial system. There are four specific channels through which rising bond yields affect equity investors.

The first is the discount rate. Every equity valuation model discounts future corporate cash flows back to a present value. The discount rate used in that calculation is anchored to the risk-free rate, essentially the yield on government bonds. When the risk-free rate rises, future cash flows are worth less today. A company expected to generate ₹100 crore of free cash flow in ten years is worth more when the discount rate is 8 per cent than when it is 10 per cent. This is why high-growth, long-duration equities, technology companies, consumer internet platforms and businesses where most of the value lies far in the future, are disproportionately sensitive to rising yields. Their valuations depend heavily on cash flows that are years or decades away.

The second channel is relative attractiveness. If a government bond yields 6.87 per cent with essentially no credit risk, an investor must ask what additional return they require to justify holding equities instead. The equity risk premium, the excess return demanded for taking equity risk, must be compelling enough to justify the choice. When bond yields are near zero, almost any equity earnings yield looks attractive by comparison. When bond yields are near 7 per cent, the calculus changes substantially. An equity that yields 4 to 5 per cent on earnings, with meaningful uncertainty about future growth, must work much harder to justify itself against a sovereign bond promising nearly 7 per cent.

The third channel is borrowing costs. Rising government bond yields eventually flow through to corporate borrowing costs, NBFC funding costs, home loan rates, working capital financing and infrastructure project economics. Companies with heavy debt loads see their interest coverage ratios compress. Capital-intensive projects that made sense at an 8 per cent cost of capital may not make sense at 10 per cent. Consumer-facing businesses find that higher EMIs reduce the affordability of cars, homes and discretionary purchases.

The fourth channel is capital flows. Global investors continuously compare the returns available across countries and asset classes. The yield differential between Indian bonds and U.S. Treasuries directly influences the attractiveness of Indian assets to foreign investors. When that differential narrows, as it has been doing, the incremental case for allocating capital to India weakens at the margin. FPI outflows from Indian equities have been a defining feature of the market through 2025 and 2026, and the bond yield environment is one structural factor behind that trend.

The Global Yield Snapshot: Where Every Major Market Stands

The current bond yield environment is not a localised phenomenon. Yields have risen across virtually every major fixed-income market, though the magnitude and causes differ.

Understanding the global picture is essential before examining India's specific situation.

Market	Current Yield	12-Month Average	Move vs. Average
India 10Y G-Sec	6.87%	6.65%	+22 bps
U.S. 10Y Treasury	4.71%	4.29%	+42 bps
U.S. 30Y Treasury	5.19-5.27%	4.87%	+35 bps
UK 10Y Gilt	5.06%	4.72%	+34 bps
Japan 10Y JGB	2.88%	2.15%	+73 bps
Japan 30Y JGB	4.06-4.07%	—	Near record high

Source: CCIL, U.S. Treasury/FRED, TradingEconomics, Bloomberg. Yields as of August 21-24, 2026.

Japan's bond market deserves particular attention because it represents a risk factor that few investors outside the fixed-income world are adequately monitoring. The Bank of Japan maintained yield curve control for years, artificially suppressing long-term Japanese government bond yields. As that policy has been unwound, Japanese yields have surged. The 30-year JGB yield is near record highs, and the 10-year has moved from near zero to 2.88 per cent. This matters for global markets because Japanese institutional investors, insurance companies, pension funds and megabanks, are among the world's largest pools of capital. For decades, these investors have been significant buyers of U.S. Treasuries, European bonds and other global assets, partly because Japanese domestic yields offered so little. As Japanese domestic yields rise, the incentive to hold foreign bonds at currency risk diminishes. Any rotation of Japanese capital back into domestic assets reduces a major source of demand for global bond markets, which can push yields higher elsewhere.

The United Kingdom's experience is also instructive. UK gilt yields have risen 34 basis points above their 12-month average, reaching 5.06 per cent on the 10-year. This reflects a combination of elevated inflation, a challenging fiscal outlook and the loss of the Bank of England's historically moderate reputation following the pension fund crisis triggered by the Truss mini-budget in 2022. Investors in gilts are now demanding meaningfully higher compensation, a reminder that sovereign bond yields can reprice rapidly when market confidence in fiscal discipline erodes.

India, by contrast, has seen a relatively contained move of just 22 basis points above its 12-month average. This comparative stability reflects the RBI's credible inflation management, domestic institutional demand from insurance companies and provident funds, and the improving fiscal trajectory of the central government. But stability relative to global peers does not mean immunity. The 6.87 per cent yield on the 10-year G-Sec represents the cost of capital against which every Indian equity valuation must ultimately be measured.

America's Debt Problem Is Becoming a Bond Market Problem

No single factor does more to explain the current global bond yield environment than the trajectory of the United States government's fiscal position. The U.S. has crossed USD 40 trillion of national debt for the first time in its history. More strikingly, the interest the U.S. government pays on that debt has now

Cover Story

surpassed military spending, making interest the second-largest item in the federal budget after Social Security and Medicare.

Fiscal Year	U.S. Net Interest Outlays	Context
FY20	\$318 billion	Pre-pandemic baseline
FY21	\$352 billion	Pandemic low rates
FY22	\$473 billion	Rate cycle begins
FY23	\$638 billion	Sharp rate increases
FY24	\$932 billion	Surpassed defence spending
FY25	\$976 billion	Approaching \$1 trillion
FY26	\$1.039 trillion	Historic first – exceeds \$1 trillion
FY36E	\$2.1 trillion	CBO projection – double current level

Source: U.S. Treasury Monthly Statements, Congressional Budget Office (CBO) Budget and Economic Outlook.

The Congressional Budget Office projects that U.S. net interest payments will roughly double again over the next decade, reaching approximately USD 2.1 trillion annually by FY2036. This creates a structural fiscal dynamic that bond markets are being forced to price. The logic is straightforward: the U.S. government must borrow to service existing debt, while simultaneously borrowing to fund its primary deficit. More bond issuance requires more investor demand. If that demand is not forthcoming at current yields, investors will require higher yields to absorb the supply. Higher yields increase the government's interest bill, which requires more borrowing, which creates more bond supply, which again pushes yields higher. This feedback loop is exactly what bond market participants have been pricing in through the sustained elevation of U.S. long-term yields.

The situation is further complicated by the private sector's demand for capital. The artificial intelligence infrastructure build-out, data centres, GPU clusters, power generation and networking, is absorbing enormous quantities of corporate debt. U.S. corporate bond issuance in 2025 reached USD 2.2 trillion, and YTD 2026 issuance has grown 26.9 per cent year on year. Technology companies, utilities building power infrastructure for AI and cloud providers are all competing with the U.S. Treasury for the same pool of long-duration investor capital. When the government and the private sector are simultaneously drawing on the same capital pool, the price of that capital, the yield, tends to rise.

The U.S. Treasury's response, announcing increased buybacks of long-dated bonds to improve market liquidity, has provided temporary relief on multiple occasions but has not addressed the underlying supply-demand imbalance. Investors watching this dynamic have drawn a pointed conclusion: the U.S. cannot indefinitely borrow at the scale its current fiscal trajectory requires without offering increasingly generous compensation. And when America's risk-free rate rises, it lifts the floor for the cost of capital globally.

The Equity-Bond Competition: The Data That Changes the Conversation

The most important question for equity investors is not simply

whether bond yields are high or rising. It is whether the current level of equity valuations adequately compensates investors for the equity risk they are taking relative to the now-available return on government bonds. The historical data on this relationship reveals something that most equity investors have not fully internalised.

Period	Nifty 50 P/E	Earnings Yield	10Y G-Sec Yield	Equity-Bond Spread
2015	21.10x	4.74%	7.76%	-3.02%
2018	26.00x	3.85%	7.37%	-3.52%
2020	37.26x	2.68%	5.89%	-3.21%
2022	22.00x	4.55%	7.33%	-2.78%
2024	22.30x	4.48%	6.87%	-2.39%
2026*	20.37x	4.91%	6.87%	-1.96%

*2026 figures use the current Nifty P/E of 20.37x and the August 2026 10-year G-Sec yield of 6.87 per cent.

Earnings yield = 1/P/E.

The earnings yield is calculated by inverting the price-to-earnings ratio. At a Nifty 50 P/E of 20.37 times, the earnings yield is 4.91 per cent, meaning that for every rupee invested in the index, investors are effectively buying 4.91 paise of current earnings per year. The equity-bond spread is the difference between this earnings yield and the 10-year G-Sec yield. A negative spread means the government bond currently offers a higher nominal yield than the equity's earnings yield. An investor who chooses equities over government bonds at a negative spread is essentially betting that future earnings growth will more than compensate for the current yield disadvantage.

The spread has been negative throughout the entire period shown in this table, equities have always offered a lower current earnings yield than government bonds. This is normal and expected. Equity earnings grow over time, whereas bond coupons are fixed. A rational investor accepts a lower current yield from equities in exchange for the expectation of growing future earnings. The important analytical question is not whether the spread is negative, but whether it is more or less negative than history suggests is appropriate.

Here, the data delivers a nuanced but important message. The equity-bond spread in 2026, at -1.96 per cent, is the least negative in this entire dataset, meaning equities today are relatively more attractive compared to bonds than they were in 2018 or 2020, when spreads were -3.52 per cent and -3.21 per cent, respectively. At first glance, this appears reassuring. But the context matters. In 2020, the government bond yielded only 5.89 per cent. The spread was wide because the bond offered very little. Today, the bond yields 6.87 per cent. The spread is narrower not because equities have become cheaper in absolute terms, but because the risk-free rate has reset higher. Investors are now being offered a genuine alternative.

The practical implication is this: when government bonds offer nearly 7 per cent, the case for equities rests entirely on the quality and sustainability of earnings growth. A business whose earnings are growing at 15 to 20 per cent per year can

comfortably justify a P/E well above 20 times. A business growing at 8 to 10 per cent must work harder to justify that valuation when the investor can earn almost 7 per cent with no credit risk. The bond market is not predicting an equity market crash. It is raising the bar for what constitutes a genuinely attractive equity investment.

Nifty P/E	Earnings Yield	Vs. 10Y G-Sec (6.87%)	Earnings Growth Needed to Justify Equity
15x	6.67%	-0.20% (near parity)	Low – bond parity almost achieved
18x	5.56%	-1.31%	Moderate – needs consistent growth
20x	5.00%	-1.87%	Meaningful – requires 12-15%+ growth
22x	4.55%	-2.32%	Demanding – requires 15%+ growth
25x	4.00%	-2.87%	High – growth must be sustained
30x	3.33%	-3.54%	Very high – only for exceptional growers
40x	2.50%	-4.37%	Extreme – requires multi-decade compounding story

This table illustrates precisely why bond yields matter for equity valuations. At a Nifty P/E of 20 times, close to the current level, the earnings yield is 5 per cent against a government bond yielding 6.87 per cent. The investor is accepting a 1.87 per cent current yield sacrifice in exchange for future earnings growth. This is rational if earnings grow at 12 to 15 per cent or more annually. But it becomes increasingly difficult to justify as the P/E rises. A stock at 30 times earnings offers only a 3.33 per cent earnings yield against a 6.87 per cent bond, a 3.54 percentage-point sacrifice that requires sustained double-digit earnings growth for many years to compensate. Not impossible, but far more demanding than it was when bonds yielded 2 per cent.

The India-U.S. Yield Differential: A Cushion That Is Shrinking

For international investors deciding where to allocate capital, the relationship between Indian and U.S. bond yields is a critical variable. The India-U.S. 10-year yield differential tells foreign investors how much additional return India offers relative to the world's safest government bond. A wider spread makes India more attractive. A narrower spread reduces the incremental case for allocating to India.

Year	India 10Y G-Sec	U.S. 10Y Treasury	India-U.S. Spread	USD/INR (Annual Average)
2015	7.76%	2.14%	5.62 pp	64.17
2018	7.37%	2.91%	4.46 pp	68.43
2020	5.89%	0.89%	5.00 pp	74.1
2022	7.33%	2.95%	4.38 pp	78.61
2024	6.87%	4.41%	2.46 pp	83.67
2026 (Aug.)	6.87%	4.68%	2.19 pp	93.64 (YTD avg.)

The data tells a striking story. In 2015, India offered a yield premium of 5.62 percentage points over U.S. Treasuries. By August 2026, that premium has compressed to just 2.19 percentage points, near multi-decade lows by several measures. This compression has happened through a combination of Indian yields remaining relatively stable and U.S. yields rising sharply. The result is that India no longer offers the same

incremental yield advantage to global fixed-income investors that it did for most of the previous decade.

This matters because the yield differential is one of the primary drivers of foreign portfolio investor allocation to Indian bonds. When the spread is wide, India attracts bond capital from global investors seeking higher yields. When the spread narrows, that flow becomes less automatic. Reduced foreign demand for Indian bonds can put upward pressure on domestic yields, creating a secondary channel through which U.S. bond market stress transmits into India even if Indian fundamentals remain intact.

The rupee adds another layer of complexity. An investor buying Indian bonds earns the rupee yield, but must also bear the risk of rupee depreciation when converting returns back to dollars. The USD/INR rate has moved from 64.17 in 2015 to 93.64 as a 2026 year-to-date average, a depreciation of approximately 46 per cent over eleven years, or roughly 3.5 per cent annually. For a foreign investor earning 6.87 per cent on Indian bonds and experiencing 3 to 4 per cent annual rupee depreciation, the hedged return in dollar terms falls to just 2.87 to 3.87 per cent, barely above what they can earn on U.S. government bonds without any currency risk. This currency-adjusted arithmetic explains why India does not automatically attract global bond capital simply by offering higher nominal yields.

For equity investors, the implications are direct. FPI outflows from Indian equities, which reached ₹2.4 trillion in the year to August 2026, are partly explained by this yield differential compression. When global investors can earn nearly 4.7 per cent on U.S. Treasuries in the world's reserve currency, the hurdle for emerging market equity allocation rises materially. India must compete not just on its growth story, but on relative valuation, currency stability and earnings delivery.

Not All Rising Yields Are Created Equal: The Three Scenarios

Before drawing conclusions about what rising yields mean for equity markets, it is essential to understand why yields are rising. The impact on equities differs dramatically depending on the cause.

In the first scenario, yields rise because economic growth is genuinely accelerating. Corporate revenues are expanding, unemployment is low, investment is increasing, and the economy is operating at capacity. In this environment, central banks raise rates or allow bond yields to rise as a natural consequence of demand for capital. Corporate earnings typically keep pace with or exceed the rise in yields, so equity valuations can sustain themselves even as the discount rate rises. Equities can perform well in this environment, particularly cyclical businesses that benefit directly from economic expansion. This is the benign scenario for rising yields, uncomfortable for bondholders, but not necessarily damaging for equities.

Cover Story

In the second scenario, yields rise because inflation is elevated or uncertain. The economy may not be growing faster, but costs are rising for energy, labour and inputs, creating pressure on corporate margins at the same time that the discount rate rises. Central banks tighten policy to combat inflation, raising both short-term rates and, through expectations, long-term yields. Equity earnings may grow in nominal terms but often not fast enough to offset the combined impact of multiple compression and margin pressure. This scenario is more challenging for equities, and it is closer to what India and much of the world experienced in 2022.

The third and most concerning scenario is one where yields rise primarily because of fiscal stress: governments are borrowing more than markets are comfortable absorbing at current yields, creating a supply-demand imbalance in the bond market. In this scenario, yields rise not because growth is strong or inflation is high, but because investors are demanding higher compensation for the risk of lending to a heavily indebted government. This does not automatically trigger a crisis, but it does establish a structurally higher risk-free rate. Corporate earnings do not benefit from this kind of yield rise.

The Three Yield Scenarios and What They Mean for Equities

- **Scenario 1**, Yields rise on strong growth: Earnings keep pace; equities can absorb the impact. Cyclical tend to outperform.
- **Scenario 2**, Yields rise on inflation: Margins compress alongside rising discount rates. Equities face double pressure. Real assets can outperform.
- **Scenario 3**, Yields rise on fiscal stress: Risk-free rate rises without earnings benefit. Multiple compression without an earnings catalyst. Most challenging for long-duration growth equities.

Current environment: Elements of all three scenarios are present globally, with the U.S. fiscal trajectory adding a structural floor to long-term yields that is unlikely to resolve quickly. For Indian investors: India is primarily in Scenarios 1 and 2 domestically, but Scenario 3 transmits through global yield spillovers, FPI outflows and rupee pressure.

How Higher Rates Hit Indian Sectors: A Detailed Framework

The impact of a sustained higher-rate environment is not uniform across Indian equities. Different sectors have fundamentally different sensitivities to interest rates, and understanding those differences is essential for positioning portfolios intelligently in the current environment.

Sector	Rate Sensitivity	Effect of Higher-for-Longer Rates	Key Metrics to Watch
Banks & NBFCs	Mixed – can benefit or be hurt	NIM may hold up initially as lending rates reprice faster than deposit costs. Steeper yield curve supportive. Risk: asset quality if growth slows and deposit cost pressure over time.	NIM trajectory, CASA ratio, asset quality, credit cost, G-Sec portfolio mark-to-market
Real Estate	High – negative	Higher home loan rates reduce affordability and buying power. Project financing costs rise. Developers with high leverage face margin compression. Premium segment more resilient than affordable.	Sales volumes, ASP trends, inventory levels, developer debt levels, housing finance affordability index
Automobiles	Moderate – negative	Higher vehicle loan rates reduce EMI affordability. Two-wheeler segment more sensitive than SUV buyers. CV segment tied to broader economic activity and freight demand.	Vehicle loan rates, monthly sales volumes by segment, EMI-to-income ratios, rural income trends
Capital Goods & Infrastructure	Moderate to High	Project IRRs require re-evaluation at higher discount rates. Long-duration projects most sensitive. Government capex provides some offset as fiscal priority. Private capex more vulnerable to rate uncertainty.	Order inflows, execution rates, project financing costs, order-to-bill ratios, government capex disbursements
IT / Technology	High – negative on valuations	Long-duration cash flows mean significant discount rate sensitivity. Valuation multiples compress even before earnings change. U.S. macro uncertainty adds demand-side risk for Indian IT companies.	Revenue growth guidance, deal win momentum, client discretionary spending, margin trajectory, P/E relative to sector growth rate
FMCG / Consumer Staples	Moderate – negative on valuations	Premium valuations on bond-like earnings profiles mean multiple compression risk. Pricing power partially offsets input cost pressure. Rural demand recovery tied to agricultural income not interest rates.	Gross margin trends, volume vs price growth, rural vs urban split, premium portfolio growth, competitive intensity from new brands
Pharmaceuticals	Low to Moderate	More defensive cash flows reduce rate sensitivity. U.S. generics pricing and domestic formulations more important than interest rates. Export-oriented earnings provide currency hedge.	U.S. FDA approvals, domestic formulation growth, specialty pipeline, EBITDA margin trend, currency impact on export earnings
High-Quality Compounders	Low – relatively insulated	Strong free cash flow, low or zero debt and pricing power create natural insulation. Earnings-led re-rating remains possible. FCF yield relative to G-Sec yield is the key valuation test.	FCF yield vs G-Sec yield, ROCE, debt-to-equity, pricing power track record, earnings growth consistency
Long-Duration Growth / Pre-Profit	Very High – most exposed	Highest discount rate sensitivity. Multiple compression can be severe even with improving fundamentals. Investors demand profitability clarity as the cost of capital rises.	Path to profitability, cash burn rate, external funding dependency, revenue growth vs burn ratio, market leadership position

Borrowing costs go up without the offsetting benefit of faster nominal revenue growth. Equity multiples can compress without a corresponding earnings catalyst to support them.

The current global environment, U.S. fiscal deficits expanding, Treasury debt crossing USD 40 trillion, and AI capex creating additional corporate bond supply, contains elements of all three scenarios. The U.S. economy has been resilient, which reflects Scenario 1. Inflation remains uncertain, particularly in services and energy, which reflects Scenario 2. The scale of U.S. government borrowing is introducing supply pressure that is at least partly characteristic of Scenario 3. India's situation has domestic dimensions of Scenarios 1 and 2, reasonable growth combined with manageable inflation, but is not immune to the global transmission of U.S. fiscal stress through yield spillovers and FPI flows.

The banking and NBFC sector requires particular nuance because rising yields are not uniformly negative for lenders. In the early phase of a rate cycle, when short-term rates rise faster than deposit costs reprice, banks can experience net interest margin expansion; their lending rates rise immediately while their funding costs adjust more slowly. However, as the cycle matures and deposit rates catch up, the margin tailwind fades. Additionally, banks hold large portfolios of government securities whose mark-to-market values fall when yields rise. The net impact depends on the duration of the bank's bond portfolio, the pace of credit repricing, and the trajectory of asset quality as borrowers face higher EMIs.

For high-quality compounders, businesses with strong free cash flow generation, minimal debt, genuine pricing power and high returns on capital, the rate environment is a relative advantage rather than a threat. These businesses do not depend on cheap

external funding to generate returns. Their earnings compound through pricing power and reinvestment at high returns on capital. In a world where government bonds offer nearly 7 per cent, the threshold for what constitutes an attractive equity rises, but businesses genuinely compounding at 15 to 20 per cent on equity continue to clear that threshold comfortably. The challenge is that such businesses often trade at high multiples precisely because of their quality, making them vulnerable to multiple compression even when earnings remain intact.

The most vulnerable category is long-duration growth equities, businesses where the investment thesis rests on future earnings that are years away and where the current valuation implies years of rapid growth that must be discounted at the new, higher risk-free rate. A company trading at 40 times earnings has an implied earnings yield of only 2.5 per cent against a government bond yielding 6.87 per cent. Every additional 100 basis points of yield increase widens that gap and forces a reassessment of the multiple the market is willing to pay. This does not mean such companies are bad businesses; it means their stocks must be evaluated with explicit honesty about what earnings growth is actually embedded in the current price.

Small and Mid-Caps: Is the Vulnerability Greater?

The question of whether small- and mid-cap stocks are disproportionately vulnerable in a rising yield environment is not straightforward. The intuitive answer, that smaller, more leveraged, less liquid companies are more exposed, is correct in some circumstances but too simplistic as a general statement.

Small- and mid-cap companies face several specific vulnerabilities in a higher-rate environment. Their cost of borrowing tends to be higher than that of large-cap peers, meaning that a rise in market rates translates more directly and more painfully into their interest expense. Their access to capital markets is more constrained.

A small-cap company that needs external equity or debt funding faces a more demanding investor environment when the risk-free rate is high. Their earnings visibility is typically lower, making them more sensitive to valuation multiple compression when investors become more discriminating. And their liquidity is lower, meaning that institutional selling during risk-off periods can cause price moves that are disproportionate to changes in underlying fundamentals.

But there is an important counterpoint. Many of India's strongest compounders are mid-cap businesses, companies growing revenues and earnings at 20 to 30 per cent annually from positions of market leadership in niche segments, with minimal debt and strong cash generation. For these businesses, a higher interest rate environment is not a material constraint. Their earnings growth substantially exceeds the rise in the risk-free rate. Their balance sheets do not require expensive

external funding. And their competitive positions are strong enough to pass on price increases if input costs rise.

The appropriate framework is therefore not 'small caps are dangerous in a rising rate environment.' It is 'the higher the valuation and the weaker the balance sheet, the more sensitive the stock is to a rise in the risk-free rate regardless of market capitalisation.'

A mid-cap company trading at 15 times earnings with 25 per cent earnings growth and no debt is far less vulnerable than a large-cap company trading at 35 times earnings with modest growth and significant leverage. Market capitalisation is a secondary factor. Valuation relative to growth, balance sheet strength and earnings visibility are the primary variables.

India's Bond Market Is Becoming More Global and More Sensitive

One of the structural changes underway in Indian fixed income is the progressive integration of Indian government bonds into global bond indices. India's inclusion in JP Morgan's Government Bond Index-Emerging Markets in 2024 marked a turning point, opening the Indian bond market to a much larger pool of passive international capital. Bloomberg's Global Aggregate Bond Index inclusion, while delayed, remains a future catalyst that could bring additional foreign flows.

This internationalisation of India's bond market has important implications for the yield dynamics that equity investors must understand. Foreign institutional investors now hold a meaningful and growing share of India's index-eligible government bonds. This creates a more liquid and internationally competitive bond market, but also one that is more sensitive to global yield movements and risk appetite shifts.

When U.S. yields rise and the India-U.S. yield differential compresses, as has happened through 2025 and 2026, foreign bond investors in India face a narrowing return advantage relative to their home markets. This can trigger outflows from Indian debt, which puts upward pressure on domestic yields. Those higher domestic yields then feed through to the equity market through all four channels described earlier: higher discount rates, reduced relative attractiveness, higher corporate borrowing costs and FII capital reallocation.

The data is already illustrating this dynamic. FPI equity outflows of approximately ₹2.4 trillion in 2026 through August partly reflect this global recalibration. Domestic institutional investors have absorbed the selling, as they did through FY26, but the structural point remains: India's bond market is now connected to global capital in ways that create transmission channels for global yield stress that did not exist at the same intensity a decade ago. This is not a reason to be pessimistic about Indian equities over the long term; it is a reason to understand that the insulation India once enjoyed from global yield shocks has diminished.

What Investors Should Watch – The Bond-Equity Dashboard

- **India 10Y G-Sec yield:** Currently 6.87 per cent. Direction matters more than level. A move towards 7.5 per cent would materially change the equity-bond spread. U.S. 10Y Treasury yield: Currently 4.68 per cent. If this moves above 5 per cent, global risk-off pressure intensifies and emerging market allocation typically suffers.
- **India-U.S. yield spread:** Currently 2.19 percentage points, near multi-decade lows. Further compression would reduce FPI allocation incentive to Indian bonds. Equity earnings yield vs bond yield: Nifty earnings yield at 4.91 per cent vs G-Sec at 6.87 per cent = -1.96 per cent spread. Watch whether earnings growth is accelerating enough to justify the current P/E.
- **FPI flows:** Net ₹2.4 trillion equity outflows in 2026 YTD. Any sustained reversal would provide significant support to Indian equities. RBI repo rate vs 10Y G-Sec gap: Currently 162 basis points, the long end is pricing in a significant fiscal premium above the policy rate. U.S. net interest expense: Crossing USD 1 trillion annually in FY26, projected to reach USD 2.1 trillion by FY36. This structural U.S. fiscal pressure keeps global long-term yields elevated.

Three Scenarios for Indian Equities in the Current Bond Environment

The future path of Indian equity markets from the current position depends heavily on how the bond market evolves. Three broad scenarios can be sketched, each with distinct implications.

In the first scenario, a soft landing, U.S. economic growth remains resilient without inflation reaccelerating, allowing the Federal Reserve to gradually reduce short-term rates through 2027. U.S. long-term yields stabilise or decline modestly as fiscal concerns ease at the margin and inflation expectations moderate. The India-U.S. yield differential widens slightly, encouraging renewed FPI inflows into both Indian bonds and equities. The RBI maintains its current policy stance or eases modestly. Indian corporate earnings continue growing at 12 to 15 per cent. In this scenario, Indian equities can deliver solid returns from current levels, with the market rewarding earnings delivery rather than multiple expansion. This is the most favourable environment for Indian equities and is plausible if global inflation continues moderating.

In the second scenario, higher for longer, U.S. yields remain elevated and the India-U.S. spread stays compressed. The RBI maintains its rate stance and Indian 10-year yields stay in the 6.75 to 7 per cent range. Indian equities deliver returns roughly in line with earnings growth, perhaps 10 to 15 per cent, but there is limited room for multiple expansion. Sector selection becomes critical, with earnings quality, balance sheet strength and pricing power differentiating winners from losers. This is a stock picker's environment, not a broad index environment. Mid-cap and small-cap stocks with high valuations and weak balance sheets underperform. High-quality compounders and businesses with genuine pricing power continue to outperform.

In the third scenario, bond market stress, U.S. long-term yields spike materially, the dollar strengthens, global risk appetite deteriorates and FPI outflows from emerging markets, including

India, accelerate. Indian 10-year G-Sec yields move towards 7.5 per cent or higher. The equity-bond spread widens negatively, making government bonds genuinely competitive with equities at current P/E levels. Equity markets correct, with high-P/E sectors and leveraged businesses bearing the brunt. This scenario is not the base case but is a material tail risk that investors with concentrated exposure to high-multiple, low-earnings-yield equities should explicitly consider. The probability of this scenario increases if the U.S. fiscal trajectory continues to deteriorate or if inflation proves more persistent than markets currently expect.

Conclusion

The bond market does not predict equity market crashes. What it does — quietly, mathematically, inexorably is set the standard against which every equity investment must be judged. When the risk-free rate was near zero, almost any equity with any growth story could justify almost any valuation. That era is over.

The current data makes the case with precision. India's 10-year G-Sec yields 6.87 per cent. The Nifty 50 trades at 20.37 times earnings, implying an earnings yield of 4.91 per cent. The equity-bond spread stands at -1.96 per cent the narrowest this decade. This does not mean Indian equities are overvalued in absolute terms. It means the argument for equities over bonds now rests entirely on the quality, sustainability and growth rate of corporate earnings. Businesses genuinely growing at 15 to 20 per cent with strong balance sheets and pricing power continue to justify significant premiums. Businesses growing at 8 to 10 per cent at elevated multiples face a far more difficult environment.

The global picture adds structural pressure. America's USD 40 trillion debt mountain, its USD 1 trillion annual interest bill and the AI-driven surge in corporate bond issuance are keeping long-term U.S. yields elevated. This global floor for the cost of capital transmits into India through yield differential compression, FPI allocation decisions and the global repricing of risk. Japan's bond market normalisation adds another variable — as Japanese domestic yields rise, one of the world's largest pools of cross-border capital has less incentive to seek returns abroad.

India's relative position remains constructive. The RBI has managed inflation credibly. Domestic institutional investors have absorbed record FPI outflows without triggering dysfunction. Corporate earnings in banking, capital goods, pharma and specialty chemicals are recovering with genuine breadth. But the bar is higher. The biggest threat to equities is not a bond yield of 6.87 per cent by itself. It is that yield in a world where earnings disappoint and investors conclude that bonds are finally offering them enough. For every equity position, the question is now the same: does this investment earn enough to justify the risk against a government bond yielding nearly 7 per cent? The companies that can answer yes will keep creating wealth. The companies that cannot should be held to account for it.

GRAPHITE GETS CHARGED

HEG
BSE Code: 509631
CMP: ₹729.15

HEG has found two triggers to keep investors interested. Globally, graphite electrode capacity is set for a trim, with GrafTech planning to reduce annual capacity by around 51,000 tonnes, including the closure of its 35,000-tonne Monterrey facility. For an industry that has struggled with excess capacity, tighter supply could gradually improve the pricing environment and support margins. Back home, HEG's demerger adds another layer to the story. September 7, 2026, has been fixed as the record date, with shareholders receiving one share of HEG Graphite for every HEG share held. The restructuring will separate the graphite electrode business from advanced materials, battery solutions and green power operations. For investors, the attraction is therefore twofold: a possible recovery in the global graphite electrode cycle and the potential for value unlocking as the company creates sharper, independently focused businesses with clearer growth priorities and a more focused capital allocation strategy ahead.

AFRICA ON TRACK

Texmaco Rail & Engineering Ltd
BSE Code: 533326
CMP: ₹113.20

Texmaco Rail is putting its export ambitions firmly on track. The company has received a USD 135 million

letter of award from Tsiko Africa Logistics and Barberry Holdings for Wabtec ES43ACi 4,500 HP diesel-electric locomotives, to be executed within 20 to 24 months of signing the definitive agreement. The award strengthens an already sizeable South African relationship, where Texmaco has been building opportunities across locomotives, wagons and railway equipment. The bigger story is the shift beyond domestic wagons, with exports gradually becoming a more meaningful growth engine for the company ahead.

PROFITS TURN CREAMIER

Milky Mist Dairy Food Ltd
BSE Code: 544868
CMP: ₹231.95

Milky Mist is showing that its growth story is about much more than selling milk. In Q1 FY27, revenue jumped 43.6 per cent to ₹973.45 crore, while PAT rose nearly tenfold to ₹64.68 crore. EBITDA increased 74.5 per cent to ₹144.89 crore, with the margin improving to 14.88 per cent from 12.24 per cent. The more interesting part is the product mix. Yogurt revenue surged 153 per cent, while ice cream sales grew 60 per cent, reflecting stronger demand for higher-value dairy products. The company has also commissioned a 120 MT-per-day Cheddar cheese facility. For investors, Milky Mist is gradually moving from a dairy processor towards a broader value-added food business, where premiumisation, better capacity utilisation and operating leverage could increasingly drive the next leg of sustainable earnings growth momentum ahead.

OLD JEWEL, NEW SHINE

Tribhovandas Bhimji Zaveri Ltd.
BSE Code: 534369
CMP: ₹366.50

TBZ has acquired a fresh shine after GRT Jewellers agreed to buy the promoter group's entire 74.12 per cent stake for up to ₹1,033.71 crore. GRT will acquire around 4.95 crore shares at up to ₹209 apiece and has triggered a mandatory open offer for approximately 26 per cent. The real story lies beyond the deal price. GRT is strong in South India, while the 162-year-old TBZ is established in western India. Together, they could create a wider national jewellery platform and open a new growth chapter.

The Mid-Cap Test

In my experience of watching Indian markets for over two decades, few things are more seductive than a strong mid-cap rally. The numbers look impressive, the alpha appears healthy, and investor interest follows almost automatically. Yet averages have a way of flattering performance while hiding the real story.

This is precisely why we dedicated our latest cover story to mid-cap mutual funds. The central argument we made is straightforward: selecting a mid-cap fund purely on the basis of trailing returns is incomplete and often misleading. What matters more is how that fund behaves when markets turn, how consistently it has generated alpha across different cycles, and whether the investment process is robust enough to protect capital during market drawdowns.

I have seen too many periods where impressive three-year or five-year numbers were driven by a couple of strong years, only for the same funds to struggle when liquidity tightened or valuations corrected. A high average return can mask uneven performance. Consistency of alpha and meaningful downside protection are far more valuable than the occasional spectacular burst of outperformance.

Mid-caps occupy a useful space in your portfolio. They are large enough to allow proper research and reasonably orderly exits, yet still offer enough inefficiency for skilled managers to create genuine excess returns. The better funds in this space do not simply ride the market higher; they demonstrate a repeatable process that balances opportunity with risk control.

As an editor, my advice remains the same as the one we put on our cover: look beyond the return number. Examine how the fund has protected money in corrections, how steady its alpha has been across market regimes, and whether the manager's process inspires confidence for the next decade, not just the last three years. In the long run, the smoother journey usually compounds better.

Shashikant Singh
Executive Editor

Understanding Capture Ratios

I really liked the Mutual Fund Awards feature in the magazine, and the selection criteria gave me useful insights into choosing funds. Could you please explain the upside and downside capture ratios and how investors can use them to evaluate a fund?

- Sanjeev P.

Editor Responds : Upside and downside capture ratios help investors understand how a mutual fund performs compared with its benchmark during rising and falling markets. An upside capture ratio above 100 indicates that the fund has outperformed its benchmark during periods when the benchmark gained. For example, a ratio of 120 means the fund captured 120 per cent of the benchmark's gains. A downside capture ratio below 100 is generally considered favourable, as it indicates that the fund fell less than its benchmark during declining markets. Ideally, investors may look for funds with a high upside capture ratio and a low downside capture ratio. Together, these measures provide useful insight into a fund's performance across different market cycles.

Mid-Cap Funds: Finding The Best Of The Lot

Somewhere between the safety of a large-cap and the audacity of a small-cap sits a category that has quietly built more wealth than either, if you had the stomach to hold on. DSIJ dives into the numbers behind India's mid-cap fund boom to separate the compounders from the pretenders

Every bull market produces its own folklore. Ask any seasoned investor about the stock they wished they had bought “when it was still a mid-cap,” and you will get a wistful smile and a story that usually ends with “if only I hadn’t sold.” That regret is not an accident. It is the entire thesis of mid-cap investing compressed into one sentence.

Mid-cap companies occupy a strange and thrilling middle

ground. They have already survived the part of corporate life that kills most businesses — the scramble for capital, the fight for market share, the first brutal downturn. But they have not yet calcified into the large, slow-moving giants that dominate the Nifty 50. They are, in a sense, still writing their story, and that is precisely why investors find them irresistible. A mid-cap company today can plausibly be a large-cap a decade from now. A large-cap, by contrast, is already what it is going to be for a while.

Mutual funds built around this segment promise investors a shortcut into that story — professional stock-pickers sifting through hundreds of mid-sized businesses to find the ones capable of graduating into market leaders. It is a seductive pitch, and Indian investors have responded to it with real money, not just enthusiasm. But seduction and sound investing are not the same thing, and the data tells a more layered story than the marketing brochures suggest.

The real question DSIJ set out to answer was not whether mid-cap funds can create wealth. History has already settled that argument. The real question is which funds can be trusted to compound that wealth across a full market cycle — through the euphoria and through the correction that inevitably follows it. To answer that, we went beyond headline returns and built a risk-adjusted scorecard using drawdown data, rolling returns and return-per-unit-of-risk across twenty of India's largest mid-cap schemes.

THE ₹1 LAKH EXPERIMENT: MID-CAP VS. NIFTY 50

Numbers persuade in a way that narratives cannot, so consider a simple experiment. Imagine two investors, each putting ₹1 lakh to work at the beginning of April 2019: one in the Nifty 50 and the other in the Nifty Midcap 150. Both investors then do nothing. No panic selling during the sharp fall of 2020, no profit booking during the strong rally that followed, and no capitulation during the volatility of subsequent corrections. They simply stay invested.

₹1 lakh invested in April 2019: Nifty Midcap 150 vs. Nifty 50, tracked through August 2026

By August 2026, the large-cap investor's ₹1 lakh would have grown to around ₹2.43 lakh. The mid-cap investor, however, would have seen the investment rise to nearly ₹4.04 lakh. The difference is substantial: the mid-cap portfolio would have created around ₹1.61 lakh more wealth than the Nifty 50 portfolio over the same seven year period, highlighting the stronger wealth creation delivered by mid-caps despite navigating the same market cycles, corrections and recoveries.

An investor who exited mid-caps in frustration during the flat 2022-23 stretch would have missed almost the entire wealth-creation event that followed.

Look closer at the shape of the two lines and a second story emerges — one about temperament rather than arithmetic. Through 2019 and 2020, the two lines move almost in lockstep, occasionally with the Nifty 50 in the lead. It is only from 2022 onward that the mid-cap line pulls decisively away, and the acceleration between 2023 and 2025 is dramatic. This is the defining feature of mid-cap investing: the return is real, but it is not evenly distributed across time, and it is disproportionately captured by those who stay invested through the boring, uncomfortable middle.

The Three Phases That Defined Mid-Caps

Zoom into that seven-year stretch and three distinct chapters emerge, each with its own psychological signature.

2019: The phase of low expectations — Coming off a difficult 2018 for mid- and small-caps, valuations were undemanding and sentiment was cautious bordering on sceptical. Quality businesses were available without investors having to pay a premium for optimism. This is usually the best time to buy and the hardest time to feel good about buying, because nothing about the mood around you says “opportunity.”

2020-2021: The phase of powerful recovery — The pandemic crash was followed by one of the sharpest liquidity-driven rallies in Indian market history. Interest rates fell, retail participation surged through new demat accounts, and corporate earnings began recovering faster than most analysts had modelled. Mid-caps, being more domestically driven and more operationally leveraged than large-caps, benefited disproportionately.

2022: The phase that tested conviction — Just as investors were growing comfortable with mid-cap exuberance, the market delivered a reminder that this asset class does not move in a straight line. Rising interest rates, elevated inflation and a deteriorating global backdrop combined to produce a grinding, sideways-to-down period that lasted well over a year. Funds with disciplined valuation frameworks and diversified portfolios navigated 2022 with manageable drawdowns; funds that had chased momentum into expensive, thinly-traded names did not.

This three-act structure — cheap beginnings, euphoric middle, sobering correction — is not unique to 2019–2022. It is close to a template for how every mid-cap cycle in India has unfolded, and it is worth internalising before reading the fund-level data that follows.

The Mid-Cap Fund Boom

If the returns explain why investors are drawn to mid-caps, the flow data explains just how many of them have acted on that attraction.

Net AUM of the mid-cap fund category, August 2025 to July 2026
(₹ lakh crore)

The category's assets under management have climbed from roughly ₹4.26 lakh crore in August 2025 to over ₹5.23 lakh crore by July 2026 — a jump of close to 22.6 per cent in under a year, and this during a period when markets were not uniformly rising. Note the shape of that chart, though, because it contains a second lesson. The line dips sharply into March 2026 before snapping back with startling force in April. That single month saw one of the strongest bursts of net inflows into the category in recent memory, arriving right as valuations had cooled and mid-cap indices staged a sharp rebound. In other words, the smart flow followed the correction, not the rally — a pattern that rewards investors willing to add when a segment looks unloved rather than when it is already the talk of every dinner-table conversation.

Rising AUM and swelling folio counts are, on the surface, a vote of confidence in the category. But there is a quieter warning embedded in this popularity. A category attracting record inflows will, almost mechanically, attract record numbers of mediocre funds riding on the coattails of the category's own momentum, not their own stock-picking skill. Popularity is not synonymous with quality, and the AUM chart above should be read as evidence of appetite, not as evidence of ability. That distinction is exactly what the next section of this story is built to resolve.

Selecting The Right Mid-Cap Fund: The DSIJ Framework

Within any fund category, dispersion between the best and worst performers tends to be far wider than most investors assume. Two mid-cap funds can hold entirely different portfolios, take entirely different sector bets, and produce entirely different outcomes across the same seven years — even though both are technically selling the same “mid-cap growth” story to a prospective investor. For example, in our study of 22 mid-cap funds that are in existence since 2019 the return difference between the best and worst is almost seven per cent annualised, which means almost 60 per cent in absolute terms.

To cut through that noise, DSIJ built a weighted scorecard rather than relying on a single headline number like one-year

return, which tends to reward whichever fund happened to be running hot in the most recent quarter — precisely the kind of recency bias that leads investors astray.

The DSIJ Mid-Cap Fund Scorecard Framework

Parameter	Weight
Long-term returns	30%
Rolling return consistency	25%
Downside protection	20%
Fund stability & portfolio quality	25%

Long-term returns (in this case returns since inception) carry the heaviest weight, at 30 per cent, because compounding is the entire point of being in equities in the first place. Rolling return consistency — how a fund performed across dozens of overlapping three- and five-year windows, rather than one cherry-picked window — accounts for another 25 per cent, because a fund that is brilliant in some years and disastrous in others is a much harder fund to actually hold onto. Downside protection, at 20 per cent, captures how badly a fund fell during its worst stretch and how quickly it recovered — arguably the single most psychologically important metric for a retail investor, since it is deep drawdowns, not modest ones, that trigger panic selling. The remaining 25 per cent is split between fund stability and portfolio quality: manager tenure, diversification and the absence of concentrated, high-conviction bets that can just as easily blow up as pay off.

Individual Fund Analytics: Looking Beyond Returns

Here is where the framework earns its keep. DSIJ ran the NAV history of twenty leading mid-cap schemes through four lenses: CAGR since inception (wealth creation), annualised volatility (how bumpy the ride was), maximum drawdown (the worst peak-to-trough fall an investor would have had to sit through), and a return-to-drawdown ratio that essentially measures how much return a fund generated for every unit of downside risk it exposed investors to.

All twenty mid-cap funds ranked by CAGR since inception

Ranked purely by CAGR, Motilal Oswal Midcap Fund leads the category with a return of around 22.1 per cent calculated from its first available NAV date in the dataset. Invesco India Midcap Fund and Edelweiss Mid Cap Fund follow closely at 21.2 per cent and 20.7 per cent, respectively, while HDFC Mid Cap Fund and Kotak Midcap Fund complete the top five with CAGR of 20.3 per cent and 20.2 per cent. However, the moment investors look beyond headline returns and consider factors such as volatility, drawdowns, consistency and risk management, the ranking story becomes more nuanced. This highlights why chasing the highest historical returns alone may not always lead to the most suitable investment choice.

phases. A fund that falls sharply can trigger emotional decisions, with investors often exiting near the bottom and missing the subsequent recovery.

On the other hand, some funds have delivered a more balanced return experience. Baroda BNP Paribas Mid Cap Fund, for example, combined a respectable long-term return with one of the lowest maximum drawdowns among the funds analysed, with its worst decline remaining below 20 per cent. This suggests that investors experienced a relatively smoother journey compared with many peers.

Maximum drawdown (risk) plotted against CAGR since inception (return) for each fund

Plotting each fund's long-term return against the depth of its worst drawdown reveals a very different picture from a simple return ranking. Motilal Oswal Midcap Fund, despite delivering a strong 22.1 per cent CAGR, also experienced a maximum drawdown of around 37 per cent, highlighting the level of volatility investors had to endure along the journey. Such declines are not merely statistical measures; they test an investor's ability to remain invested during difficult market

This is the core idea behind risk-adjusted investing: two funds may deliver comparable returns, but the path taken to achieve those returns can be significantly different.

A return chart shows only the destination, while a risk chart reveals the journey. Investors who consider both return and downside risk get a more complete picture before evaluating a fund's long-term performance.

The Top Five: What Worked and Why

Weighting long-term CAGR against the return-to-drawdown ratio, five funds stand out from the category.

DSIJ Top 5 Mid-Cap Funds, ranked based on a composite assessment of long-term CAGR and downside risk parameters

Fund	CAGR Since First Available NAV Date	Max. Drawdown	Calmar Ratio
Axis Midcap Fund	18.8%	-29%	0.65
Invesco India Midcap Fund	21.2%	-34%	0.62
Motilal Oswal Midcap Fund	22.1%	-37%	0.59
Kotak Midcap Fund	20.2%	-36%	0.56
Tata Mid Cap Fund	19.2%	-35%	0.55

Methodology: CAGR is calculated from the first available NAV date in the provided dataset to the latest available NAV date. Maximum drawdown represents the largest peak-to-trough decline experienced during the available NAV history. Return/Drawdown ratio is calculated as CAGR divided by maximum drawdown.

Axis Midcap Fund emerges as the strongest risk-adjusted performer in the category based on the Calmar Ratio. While its CAGR of 18.8 per cent is lower than some of the category leaders, the fund's ability to deliver those returns with a comparatively lower maximum drawdown of around 29 per cent places it at the top when returns are measured against downside risk. This highlights the importance of evaluating not just wealth creation, but also the volatility investors had to endure along the way.

Invesco India Midcap Fund offers one of the most balanced profiles in the category. With a strong 21.2 per cent CAGR and a maximum drawdown of around 34 per cent, the fund combines competitive long-term returns with reasonable downside control. Its Calmar Ratio of 0.62 places it among the most efficient return generators in the category, reflecting a favourable balance between growth and risk.

Motilal Oswal Midcap Fund stands out for its compounding ability. Delivering the highest CAGR among the analysed funds at 22.1 per cent, it has created significant long-term wealth for investors. However, this performance came with periods of sharp volatility, including a maximum drawdown of around 37 per cent. The fund's Calmar Ratio of 0.59 suggests that while the return potential has been impressive, investors needed the ability to withstand deep corrections without abandoning their investment strategy.

Kotak Midcap Fund finds a place among the leading funds with a combination of steady returns and moderate downside management. The fund delivered a 20.2 per cent CAGR with a maximum drawdown of approximately 36 per cent, resulting in a Calmar Ratio of 0.56. Its profile reflects a balance between long-term compounding and risk management.

Tata Mid Cap Fund completes the top five based on risk-

adjusted performance. With a 19.2 per cent CAGR and a maximum drawdown of around 35 per cent, the fund generated consistent long-term returns while maintaining a reasonable risk profile. Its Calmar Ratio of 0.55 places it ahead of several peers when returns are evaluated relative to downside exposure.

The key takeaway from the Calmar Ratio analysis is that the highest-returning fund is not always the most efficient wealth creator. A superior investment experience depends on the combination of return generation and the ability to limit large losses during difficult market phases.

The Bottom Five: A Lesson in What Not to Chase

If the top five highlight the importance of balancing returns with risk, the bottom five demonstrate the opposite: funds where the return generated was not sufficient to compensate investors for the depth of losses experienced during difficult market phases.

DSIJ Bottom 5 Mid-Cap Funds, ranked on Calmar Ratio, which measures return generated per unit of maximum downside risk

Fund	CAGR Since First Available NAV Date	Max. Drawdown	Calmar Ratio
Aditya Birla SL Midcap Fund	16.6%	-45%	0.37
Sundaram Mid Cap Fund	18.1%	-44%	0.41
SBI Midcap Fund	18.2%	-43%	0.42
ICICI Pru. MidCap Fund	19.6%	-44%	0.44
UTI Mid Cap Fund	18.3%	-40%	0.45

Aditya Birla SL Midcap Fund ranks lowest on risk-adjusted performance, combining the category's weakest CAGR among the analysed funds at 16.6 per cent with one of the deepest maximum drawdowns at over 45 per cent. The outcome represents an unfavourable trade-off where investors experienced significant volatility without receiving comparable long-term compensation.

Sundaram Mid Cap Fund and SBI Midcap Fund present a similar challenge. Both delivered CAGRs of around 18 per cent, which appear reasonable in isolation, but these returns came alongside maximum drawdowns exceeding 43 per cent. Their Calmar Ratios of 0.41 and 0.42 indicate that investors endured substantial downside risk for returns that remained below the category leaders.

ICICI Prudential MidCap Fund and UTI Mid Cap Fund also feature among the bottom five on a risk-adjusted basis. While their absolute returns were not among the weakest in the category, their deeper drawdowns reduced their overall efficiency. ICICI Prudential MidCap Fund delivered a 19.6 per cent CAGR, but a maximum drawdown of around 44 per cent pulled its Calmar Ratio down to 0.44. Similarly, UTI Mid Cap Fund generated an 18.3 per cent CAGR with a drawdown of over 40 per cent, resulting in a Calmar Ratio of 0.45.

The key lesson from the bottom five is that evaluating funds purely on returns can overlook the investor experience during market corrections. A fund that generates decent returns but exposes investors to steep drawdowns may be difficult to hold through a full market cycle. Risk-adjusted measures such as the Calmar Ratio help identify whether the return delivered was adequate compensation for the volatility endured.

Methodology: CAGR is calculated from the first available NAV date in the provided dataset to the latest available NAV date. Maximum drawdown represents the largest peak-to-trough decline during the available NAV history. Calmar Ratio = CAGR ÷ Maximum Drawdown.

It is rarely the absolute return number that separates a good mid-cap fund from a mediocre one. It is what an investor had to endure to earn that return.

The Valuation Question

After a rally as sharp as the one mid-caps have delivered since 2023, the honest question every investor should be asking is not “will this continue?” but “what has to be true for this to continue?” Valuation multiples across the mid-cap universe have expanded meaningfully from the depressed levels of 2019–2020, and a repeat of that multiple expansion cannot be the base case for the next five years — multiples do not compound the same way earnings do.

That does not mean the mid-cap story is over. It means the source of future returns has to shift. Where the last cycle rewarded investors simply for being present as cheap stocks re-rated, the next leg of returns will need to come from somewhere more fundamental: earnings growth, improving capital efficiency, margin expansion and disciplined execution by company managements. This is precisely why active fund selection — rather than a blanket bet on the category through an index fund — matters more now than it did in 2019, when almost any reasonably diversified mid-cap portfolio would have worked. Skilled stock-picking, the kind that shows up in DSIJ’s top-five list, becomes more valuable, not less, as the easy money in the cycle is left behind.

Risks Investors Should Understand

Volatility risk is the most visible: mid-cap stocks swing harder than large-caps in both directions, by construction. The volatility figures in this study, generally in the 15–25 per cent annualised range across funds, are simply the price of admission for the higher long-term returns documented earlier in this story.

Valuation risk is more subtle and, after the run mid-caps have had, more relevant today than it was three years ago. Paying up for growth that does not materialise is how good businesses become disappointing investments.

Behavioural risk, though, is arguably the one that costs

investors the most money over a lifetime of investing, and it is entirely self-inflicted. The instinct to buy more of a fund after it has already delivered spectacular returns — and to redeem in panic during precisely the kind of drawdown this story has spent several pages quantifying — is the single most reliable way to convert a good fund into a bad investment outcome. The AUM data earlier in this story, showing inflows chasing performance rather than anticipating it, is direct evidence that this behavioural pattern is alive and well among Indian mid-cap investors today.

Who Should Invest In Mid-Cap Funds?

Mid-cap funds reward a specific kind of investor, and it is worth being honest about who that is. They suit investors with a genuine seven-to-ten-year horizon, not a stated one that quietly shrinks the moment the portfolio turns red. They suit SIP investors in particular, since a systematic monthly investment automatically buys more units during the corrections this story has described and fewer during the euphoric phases — turning volatility from an enemy into a genuine ally. And they suit investors who can honestly say, before investing rather than after a fund has already fallen 30 per cent, that they are prepared to tolerate that kind of temporary decline without abandoning the plan.

They do not suit investors who may need the money within two or three years, and they do not suit investors whose real risk tolerance is lower than their stated risk tolerance — a gap that only reveals itself, inconveniently, during an actual correction.

Final Verdict

Mid-cap funds remain one of the more credible long-term wealth-creation opportunities available to Indian equity investors, and the data in this story — a near-50 per cent wealth advantage over large-caps across a single seven-year window, spanning a pandemic, a rate-hiking cycle and a full correction — makes the case better than any sales pitch could.

But the category’s own popularity is now its biggest trap. Rising AUM and swelling inflows do not sort good funds from mediocre ones; if anything, they make that sorting more necessary, not less, because money chasing a hot category inevitably ends up in some funds that do not deserve it.

The next phase of mid-cap returns is likely to reward the same qualities that separated DSIJ’s top five from its bottom five in this analysis: disciplined valuation frameworks, genuine downside management, and fund managers with long enough tenures to have actually been tested by a cycle like 2022.

The objective for you is not to chase last year’s chart-topper. It should be to find a fund with a repeatable process, a demonstrated ability to protect capital when markets turn, and a manager who has already proven — not promised — that they can be trusted with the next correction, whenever it arrives.

Reason for recommendation

Mid-cap funds merit consideration for many investors now because recent returns have moderated from long-term averages, offering a measured entry point for investing. The category's 12.84 per cent one-year return is below its three-, five- and seven-year averages. Investors can build exposure through SIPs instead of committing a lump sum. Invesco India Mid Cap Fund is one such fund that investors can consider and has outperformed the category average across every period shown. It returned 15.41 per cent over one year against 12.84 per cent, an advantage of 2.57 percentage points. The lead was 7.96 points over two years, 7.87 points over three years, 6.91 points over four years, 5.08 points over five years, 4.19 points over seven years and 4.40 points over ten years. The portfolio leads with services at 24.46 per cent, financials at 21.67 per cent and healthcare at 19.76 per cent, together accounting for 65.89 per cent. Construction contributes 8.76 per cent and capital goods 4.61 per cent. The mix provides exposure to credit growth, healthcare spending and investment-led expansion, with sector concentration risk.

Risk-adjusted performance is competitive, though not the category's best on every measure. Invesco's standard deviation of 19.55 and beta of 1.03 indicate high volatility. Its Sharpe ratio of

Top Holdings

COMPANY NAME	% TO NET ASSETS
Prestige Estates Projects Ltd.	7.16
The Federal Bank Ltd.	6.42
Max Healthcare Institute Ltd.	6.21
Meesho Ltd.	4.64
Global Health Ltd.	4.37
AU Small Finance Bank Ltd.	4.22
Eternal Ltd.	4.18
Indusind Bank Ltd.	4.06
BSE Ltd.	3.86
L&T Finance Ltd.	3.81

0.98 exceeds most of its peers. Its Sortino ratio is also one of the best in its category.

The five largest holdings are Prestige Estates Projects at 7.16 per cent, Federal Bank at 6.42 per cent, Max Healthcare at 6.21 per cent, Meesho at 4.64 per cent and Global Health at 4.37 per cent. These positions reinforce the fund's sector preferences while adding stock-specific concentration risk. Overall, the fund suits long-term investors seeking mid-cap growth and able to absorb above-average volatility. Its category outperformance and risk-adjusted record support a positive view, but allocation should be phased through SIPs and kept within an equity risk budget.

Nexus Equity Growth Fund
Grow Together

Tested, Not Broken

Two hard years have left Indian shares cheaper than at any time in a decade. Foreign money is returning and profits are beating forecasts, but the index, and the mood, have yet to catch up.

Fund Managers: Kushal Shah and Manthan Jhaveri, Nexus Equity Growth Fund

Every reason to avoid Indian shares has been written up, argued over and priced in. A record-low rupee. Oil at USD 105. Foreign investors leaving in the largest numbers on record. What has not been priced in is what happened afterwards: the selling stopped, profits beat forecasts, and the money started coming back. Two years of bad news are in the price. Two months of good news are not.

The blows were real. The rupee hit an all-time low of ₹96.84 to the USD in May. Brent fell to USD 69 a barrel in early July, then hit USD 105 three weeks later as tankers were attacked near the Strait of Hormuz. In March, the Nifty fell more than 10 per cent in a single month, and foreign investors pulled out the largest monthly sum on record. About ₹2.3 lakh crore has left Indian shares this year, against ₹1.66 lakh crore in all of 2025. Any one of these would have tested a market. They arrived together. They bent it. They did not break it.

What that period achieved was to bring valuations back to earth. Profits kept growing while share prices stayed flat, and the excess quietly drained away. The Nifty now trades at about 20 times trailing earnings, roughly 13 per cent below its own 10-year average. In the past decade, Indian shares have been this cheap on only two occasions: the first months of COVID-19 and the Russia-Ukraine shock. India's premium to emerging markets is among the narrowest in years, less because Indian companies deteriorated than because global money crowded into a handful of Taiwanese and Korean chipmakers. India was never part of that trade.

The turn is already visible in the flows. Foreign investors bought about ₹20,200 crore of Indian shares in July and a further ₹23,500 crore in August for a second straight month of buying, and foreign ownership remains low by past standards. The rupee has steadied near ₹95.7. The Reserve Bank held rates at 5.25 per cent on August 5, raised its growth forecast to 6.7 per cent and trimmed its inflation forecast to 5 per cent. Domestic institutions have bought more than ₹5.1 lakh crore of shares this year.

Then came the June quarter. Nifty 50 profits rose about 18 per cent, the strongest in 10 quarters and eight percentage points

ahead of forecasts, on revenue growth of 19.4 per cent. Metals and financials did the heavy lifting, and management commentary sounds confident. Beneath the flat headline number, leadership kept rotating: autos, financials, capital goods, a reviving IT sector. A flat index is not a flat market, and telling the difference is our job.

The risks are real. Brent is back near USD 90, but the Strait of Hormuz is not fully open, and another flare-up would squeeze margins and revive pressure on inflation and the rupee. Some economists expect the Reserve Bank to raise rates within a year if energy costs stay high.

But let us be plain. A market this cheap, with profits beating forecasts and foreign money returning, deserves a full weighting rather than a cautious one. Caution has been the consensus, and that consensus has already cost its holders. The evidence has turned. The index has not yet followed. That gap is the opportunity, and those who wait for full confirmation are likely to buy the same earnings at a materially higher price.

Two difficult years have tested India's equity market, but the underlying story remains intact. Valuations have cooled, earnings are surprising on the upside, foreign investors are returning and domestic flows remain strong. Yet the index and investor sentiment have barely reflected this improvement. For investors willing to look beyond the headline numbers, the gap between improving fundamentals and market sentiment could offer an opportunity.

The views expressed are the authors' own and do not constitute investment advice or a recommendation to buy or sell any security. The authors manage the Nexus Equity Growth Fund. Market data is as of August 25, 2026. Investments are subject to market risks; please read all scheme-related documents carefully.

I have always looked at average alpha when comparing mid-cap and small-cap funds, but I recently came across the view that it can be misleading. Why is that the case, and what should investors look at instead?

- Bhumika Oswal

Strong returns can certainly attract attention, but investors should look beyond the headline numbers before deciding whether a mid-cap or small-cap fund deserves a place in their portfolio. One of the most important factors is the consistency of alpha, or the fund's ability to outperform its benchmark across different market phases.

For instance, recent data may show active small-cap funds generating higher average alpha than mid-cap funds over a three-year period. However, a category-level average can sometimes conceal a very uneven experience. A handful of exceptional performers can pull up the average, while weaker funds may disappear through mergers or changes in strategy. Therefore, investors should examine performance across one, three, five and 10-year periods rather than relying on a single time frame. The path taken to

generate returns is equally important. A fund that delivers spectacular gains in a couple of years but struggles during difficult markets may not necessarily demonstrate superior investment capability. In contrast, a fund that produces modest but consistent outperformance while limiting losses during corrections can create a much stronger long-term investment experience.

This becomes particularly relevant in the small-cap segment. The universe is relatively less researched, creating opportunities for fund managers with strong research capabilities to identify businesses before they become widely recognised. However, these opportunities come with greater liquidity and volatility risks. A wrong investment decision can hurt significantly when market conditions turn adverse.

For investors, therefore, the real question is not simply whether mid-caps or small-caps generate higher alpha. It is whether the fund manager has a disciplined, repeatable process that can identify opportunities and manage risks across market cycles. Consistency, downside protection and the ability to repeat good decisions over time are far more meaningful indicators of investment skill than a single period of exceptional returns. ■

I am investing in a small-cap fund and have noticed that it has underperformed its benchmark and peers for some time. Given the volatility in this category, how can I tell whether the fund is simply going through a difficult phase or whether it is time to exit?

- Tejas Baheti

Small-cap funds naturally go through periods of underperformance because their portfolios are more sensitive to changes in market cycles, valuations, liquidity and investor sentiment. Therefore, investors should not rush to exit simply because a fund has lagged for a few quarters.

The first question should be whether the fund is still doing what it was selected to do. For instance, if a small-cap fund has temporarily underperformed because the market has favoured larger companies, that alone may not indicate a problem.

However, if the fund has consistently struggled over multiple market phases, investors should investigate further.

Look at whether the fund manager has remained consistent with the stated investment philosophy and whether the portfolio continues to reflect the category. A sudden shift towards larger companies, excessive concentration in a few stocks or sectors, or a significant change in the fund's risk profile could warrant attention.

Investors should also compare the fund with an appropriate benchmark and relevant peers over a sufficiently long period rather than reacting to short-term rankings. More importantly, examine how the fund behaves during market corrections. In small-caps particularly, protecting capital during difficult phases can be as important as participating in rallies.

A fund should not be exited merely because it is temporarily out of favour. The stronger reason to reconsider an investment is a deterioration in the fund's underlying process, persistent weakness across market conditions, or a change in the factors that originally made the fund attractive. ■

Looking Beyond Market Momentum with Flexi-cap Investing

Rahul Patel

Founder,
Aalps Wealth India Pvt Ltd.

'Flexibility is sometimes mistaken for frequent change.'

If you have followed the stock market long enough, you have probably heard multiple conversations like these.

- 'Small-caps are the place to be.'
- 'Now is the time to move back to large-caps.'
- 'Mid-caps have already had their run.'

The interesting part is that these statements often sound convincing when they are made, and the difficult part revolves around knowing whether they are still true six months later. Markets have a habit of changing direction just when investors begin to feel certain, and that is why successful equity investing is often less about reacting to headlines and more about following a disciplined investment process.

One such disciplined approach is flexicap investing. The defining feature of flexicap investing is that it is not tied to a single segment of the market. Instead, it gives fund managers the flexibility to invest across large-, mid- and small-cap companies, with allocation decisions guided by factors such as valuations, business prospects and the broader economic environment rather than fixed market-cap limits.

Momentum is not always an opportunity — When a particular part of the market performs well for an extended period, investors naturally become interested in it. Higher returns attract more attention, more discussions and, eventually, more money. But popularity and value are not always the same thing. A company, or even an entire segment of the market, can become expensive simply because expectations have run ahead of fundamentals. On the other hand, another segment may temporarily fall out of favour despite having businesses with sound earnings potential.

For long-term investors, this distinction matters. Instead of asking, 'What has performed the best recently?', a more useful question may be, 'Where is the opportunity today?' That shift in thinking lies at the heart of valuation-led investing.

Looking at more than stock prices — Stock prices tell only

part of the story. Professional investment decisions often consider a wider set of variables. Is the economy expanding? Are corporate earnings improving? How are interest rates expected to move? Are businesses investing in capacity? Is inflation under control? These factors influence how different companies perform over time.

The framework highlights that macroeconomic indicators such as GDP growth, inflation, fiscal conditions, corporate profitability and credit growth can all play a role in evaluating investment opportunities. Rather than relying on a single indicator, investment decisions are typically made by looking at the broader picture.

Markets do not always ring a bell — One of the most difficult aspects of investing is recognising turning points. By the time investors become convinced that a particular market segment is attractive, much of the re-rating may already have taken place. Likewise, periods of pessimism can create opportunities that are easy to miss because sentiment remains weak.

This is why disciplined investing often differs from popular investing. Instead of following market excitement, a flexible investment strategy can gradually shift exposure as relative valuations change. It does not attempt to predict every short-term movement. Rather, it seeks to identify where the balance between risk and opportunity appears more favourable.

Flexibility with a framework — Flexibility is sometimes mistaken for frequent change. In reality, successful investing requires discipline as much as freedom. Flexicap investing combines flexibility with a structured investment framework, wherein allocation across market capitalisations is supported by research, valuation assessment and ongoing review of macroeconomic developments, rather than arbitrary shifts. This distinction is important because flexibility without a process can quickly become speculation.

Thinking beyond today's market — Every market phase creates its own narrative. At one point, stability dominates conversations. At another, growth becomes the priority. Investors who keep chasing these narratives often find themselves reacting after markets have already moved. Flexicap investing offers a different perspective. Instead of committing to one part of the market, it allows portfolios to evolve alongside changing opportunities. The emphasis is not on identifying the next fashionable segment but on building a portfolio that can respond to valuations, business quality and economic conditions over time. For investors, that may be one of the most valuable lessons in equity investing: long-term wealth creation is rarely driven by chasing what is popular today. More often, it comes from staying invested in a disciplined strategy that has the flexibility to adapt when markets inevitably change.

The writer is Founder, Aalps Wealth India Pvt Ltd.

Why does one investor rush into last year's best-performing fund while another deliberately chooses a scheme that has been out of favour? Why does one switch funds whenever the rankings change while another stays invested through an entire market cycle? The answer may have less to do with the fund and more to do with the investor holding it. Because every portfolio has a personality. The real question is: does it reflect you?

Imagine multiple investors starting with the same amount of money, exploring the same mutual fund universe and having access to the same information. One sorts funds by one-year returns and immediately focuses on the best performers. Another searches for funds that have struggled recently but could benefit when the market cycle changes. A third looks beyond rankings, seeking consistency across different market conditions.

None is necessarily wrong. They are simply looking at mutual funds through different lenses. Investing is often reduced to numbers: comparing returns, checking expense ratios, examining portfolios, evaluating fund managers and making a choice. Yet behind every investment decision lies something less measurable but equally influential: behaviour.

A mutual fund portfolio can reveal whether an investor is patient or impatient, attracted to excitement or consistency, comfortable with uncertainty or looking for reassurance. More importantly, it can show whether the investor genuinely understands why a particular fund was selected. There is no

universally superior investment personality. The real question, therefore, is not which personality is best, but which one are you, and does your mutual fund portfolio truly reflect it?

The Momentum Chaser: "What's Topping the Charts?"

A mutual fund ranking table can be surprisingly powerful. One fund has delivered 32 per cent over the past year. Another has returned 21 per cent. A third has managed 14 per cent. The temptation is almost automatic: why settle for 14 per cent when the top-ranked fund has delivered more than twice as much? This is where the momentum personality enters. The momentum chaser is attracted to what is already working.

In the mutual fund world, that could mean the fund that has recently climbed to the top of its category, the sector that has suddenly become fashionable or the thematic strategy that has benefited from a powerful market trend. The investor may not necessarily understand the entire portfolio. The attraction begins with performance. The fund has done well; therefore, it

must be good. But there is an important distinction between following momentum deliberately and chasing performance emotionally.

An investor who understands that a particular market trend is strengthening and consciously allocates a part of the portfolio to participate in it is following a strategy. An investor who sees a fund at the top of the one-year return table and invests simply because everyone else appears to be making money is chasing a result. The difference can become expensive. Mutual fund returns are not delivered in a straight line. A fund that benefited from a particular sector, market-cap segment or investment style during one period may not necessarily remain at the top during the next.

By the time an investor discovers the winner, much of the underlying rally may already have happened. The momentum investor therefore needs one crucial discipline: know what is driving the performance and what would make you exit. If the reason for investing was a specific trend, the investor should know what would indicate that the trend is weakening. Otherwise, a strategy designed to participate in momentum can quietly become a long-term holding after the momentum disappears.

- **Ideal temperament:** Comfortable with volatility, active monitoring and shorter decision cycles.
- **Typical approach:** Follows recent performance, emerging themes and market trends.
- **Biggest strength:** Ability to participate in powerful market trends.
- **Biggest risk:** Buying yesterday's winner after much of the move has already happened.

The momentum portfolio says:

“I would rather participate in a strong trend than wait for perfect certainty.”

The Value Hunter: “What Is the Market Missing?”

Now imagine a fund that has not been exciting for several years. It does not appear at the top of the performance charts. Investors have moved on to newer themes and more fashionable strategies. The value-oriented investor sees something different. Instead of asking, “Which fund has performed best?”, this investor asks, “What is currently out of favour, and is the pessimism already reflected in the underlying portfolio?”

This personality may naturally gravitate towards value-oriented or contra strategies, or towards categories that have been temporarily overlooked. The attraction is not necessarily poor performance itself. It is the possibility that the market's current preference has created an opportunity. But mutual fund investing makes this more complicated than simply buying a

cheap stock. An investor cannot look at a fund in isolation and declare it undervalued merely because its recent return is low.

The investor must understand the underlying portfolio, the investment style, the sectors and companies the fund owns, and the reason those holdings may eventually recover. The value hunter is willing to wait for the market to rediscover what others have ignored. That patience, however, has a dark side. A fund can remain out of favour for much longer than expected. Worse, an investor may convince themselves that underperformance is automatically a sign of future opportunity. It is not.

There is a difference between a fund temporarily struggling because its investment style is out of favour and a fund consistently failing to execute its stated strategy. The value personality therefore needs to ask difficult questions. Is the underlying portfolio still aligned with the original investment thesis? Has the fund manager's approach changed? Is the category itself moving through a normal cycle? Or is the investor simply trying to justify holding a poor-performing fund because selling would mean admitting the original decision was wrong?

- **Ideal temperament:** Patient, analytical and comfortable going against popular opinion.
- **Typical approach:** Looks for undervalued or out-of-favour strategies and categories.
- **Biggest strength:** Ability to enter areas before sentiment improves.
- **Biggest risk:** Mistaking prolonged weakness for hidden value.

The value portfolio says:

“I do not need to own what is popular today. I want to understand what could become valuable tomorrow.”

The Quality Seeker: “Which Fund Can I Rely On?”

Not every investor wants excitement. Some investors open a mutual fund factsheet and start looking beyond the latest return. They want to know how the fund has behaved across market cycles. They examine consistency, portfolio quality, investment philosophy, fund management and the ability to protect capital during difficult periods. This is the quality seeker. For this investor, the best fund is not necessarily the one with the highest return. It is the one whose investment process inspires confidence.

Consider two different funds. One has delivered spectacular returns during the latest rally but has also experienced sharp swings. Another has produced less dramatic returns but has remained relatively consistent across different market

environments. The momentum investor may prefer the first. The quality seeker may prefer the second. This personality understands that mutual fund investing is not about winning every quarter. It is about finding a strategy that can remain relevant for years.

But quality has its own trap. Investors can become so impressed by a fund's long-term record, fund manager reputation or consistency that they stop questioning whether the fund still fits their portfolio. A strong historical record does not guarantee future performance. And a fund that has been excellent for many years can still go through periods of underperformance. The quality seeker therefore needs to avoid another common mistake: turning admiration into blind loyalty. The right question is not, "Has this fund always been good?" It is, "Is this fund still doing what I bought it to do?"

- **Ideal temperament:** Patient, long-term oriented and focused on process rather than short-term rankings.
- **Typical approach:** Looks for consistency, portfolio quality and a robust investment process.
- **Biggest strength:** Greater ability to stay invested through market cycles and benefit from compounding.
- **Biggest risk:** Assuming a strong historical record guarantees future performance.

The quality portfolio says:

“I want a fund whose process can make my patience productive.”

The Income Seeker: “I Want Returns Along the Way”

For some investors, wealth creation is not only about seeing the value of their investment rise. They also want to see money coming back to them periodically. This is where the income-oriented personality appears. Such investors may be attracted to dividend-yield strategies or mutual fund options that they associate with regular cash distributions. The psychological appeal is obvious. Watching an investment generate a cash flow can make the investment feel tangible, particularly during periods when markets are volatile.

But this is where investors need to separate cash distribution from wealth creation. A distribution from a mutual fund should not automatically be interpreted as additional return. What matters is the total outcome of the investment, including the value of the units after the distribution. The income seeker therefore needs to look beyond the comfort of receiving money periodically.

For an investor genuinely seeking regular cash flows, the larger financial plan also matters. The objective may be to complement other sources of income rather than maximise short-term returns. The income personality is therefore less interested in the excitement of finding tomorrow's biggest

winner and more interested in building a portfolio that can support financial needs over time.

- **Ideal temperament:** Income-oriented, patient and comfortable with established investment strategies.
- **Typical approach:** Focuses on cash-flow-oriented strategies and regular distributions.
- **Biggest strength:** Keeps the investor focused on the role investments play in broader financial planning.
- **Biggest risk:** Mistaking regular distributions for superior returns.

The income portfolio says:

“I want my investments to play a role in my financial life, not just sit on a screen.”

The Turnaround Hunter: “Is This Fund Ready for a Comeback?”

Then comes the investor who looks at a fund that everyone else has overlooked and thinks, “Maybe this is exactly when I should be paying attention.” The turnaround hunter is attracted to recovery. A sectoral fund may have spent years struggling. A thematic category may have fallen sharply from its previous popularity. A fund's investment style may have gone through a prolonged period of underperformance. Most investors see disappointment. The turnaround hunter sees possibility.

This investor believes that market leadership can change. A neglected sector can regain momentum. An investment style can return to favour. Companies that struggled in one economic environment can perform differently when conditions change. The attraction lies in the gap between where the fund has been and where it could go. But this personality needs more than optimism. A fund that has underperformed is not automatically a turnaround opportunity.

The investor needs evidence that the conditions behind the underperformance are changing. Are the underlying companies showing better earnings momentum? Is the sector entering a more favourable cycle? Has the investment process changed? Is the fund manager taking a different approach? Are there measurable signs that the previous weakness is beginning to reverse? Without such evidence, turnaround investing can become little more than hope disguised as analysis.

Another risk investors need to watch out for is emotional attachment. Once investors convince themselves that a fund is about to recover, every positive development can look like confirmation while negative evidence gets dismissed as temporary. Years can pass while the investor waits for the promised turnaround. A disciplined turnaround hunter therefore needs milestones. The thesis should have something that can be monitored. If those milestones do not appear, the investor must be willing to reconsider the decision.

- **Ideal temperament:** Contrarian, patient and comfortable with uncertainty.
- **Typical approach:** Looks for beaten-down funds, categories or strategies with potential for recovery.
- **Biggest strength:** Ability to identify opportunities before sentiment turns.
- **Biggest risk:** Holding on to a broken thesis because recovery always feels “just around the corner”.

The turnaround portfolio says:

“I am willing to endure today's disappointment for the possibility of a stronger tomorrow.”

Why Did You Choose This Fund?

After understanding the five major investment personalities discussed above, imagine all five evaluating the same mutual fund. The fund has delivered a strong three-year return. Its portfolio is available for everyone to see. Its factsheet is public. Its fund manager's commentary is accessible. Yet five investors may reach five completely different conclusions.

- The momentum chaser asks, “Is this fund still gaining?”
- The value hunter asks, “Is the current opportunity already reflected in its portfolio?”
- The quality seeker asks, “Can I trust this process over a full market cycle?”
- The income seeker asks, “Does this strategy fit my need for cash flow?”
- The turnaround hunter asks, “Could this fund become the next winner after a period of weakness?”

The same fund, factsheet and market can lead to different conclusions for different investors. This is why mutual fund selection cannot be reduced to a single ranking table. The problem begins when investors unknowingly switch personalities.

A momentum chaser may buy a fund after a spectacular rally, watch it decline and suddenly convince themselves that they are now a value investor. A turnaround hunter may keep holding an underperforming fund because selling would mean accepting that the expected recovery never arrived.

The better question is simple: Why did I choose this fund? The answer should determine how you monitor it. A momentum-oriented fund may require closer attention to the trend or theme behind its performance. A value strategy may need more patience. A quality-oriented fund needs to be assessed on the consistency of its process.

An income-focused investment needs to be evaluated for the sustainability and relevance of its cash flows. A turnaround strategy requires evidence that the recovery thesis is actually progressing. The purpose is not to label yourself permanently. It is to understand yourself better.

When Your Investment Personality Changes

The next question is: Does every investor need to fit into one investment personality? Not at all. A portfolio can contain different investment styles. In fact, different strategies can serve different purposes. The problem is not owning different types of funds. The problem is owning them without understanding why they are there. A diversified portfolio is not simply a collection of categories. It is a collection of decisions.

One fund may be there for long-term wealth creation. Another may provide exposure to a particular investment style. A third may complement the portfolio during a different market environment. Each holding should have a role rather than merely occupying space because it once appeared on a top-performing list. This becomes even more important because an investor's personality can change.

A young investor with a long investment horizon may be comfortable with greater volatility. As financial responsibilities increase, the same investor may begin to value stability more. Someone who once chased aggressive themes may eventually become more interested in consistency and diversification. There is nothing wrong with changing. The mistake is changing without realising it.

The Final Thought

Your mutual fund portfolio is more than a collection of schemes. It is a mirror of the decisions, expectations and behaviour that shape your investment journey. Look closely, and it may reveal whether you are drawn to excitement or consistency, opportunity or popularity, income or long-term growth. It may also reveal your patience, your comfort with uncertainty and, sometimes, your tendency to chase what has already performed well. That is why the next time you review your portfolio, do not begin by asking which fund delivered the highest return.

Ask a more important question: Why should I choose this fund? A clear answer means the fund has a purpose. It may be there for long-term wealth creation, diversification, a particular investment style or to complement another holding. Without that clarity, even a diversified portfolio can become merely a collection of schemes. Your investment personality can also evolve as your goals, responsibilities, time horizon and risk tolerance change. Recognising that change is just as important as recognising your original investment style.

Successful mutual fund investing is not about finding the fund that will always top the charts. It is about choosing investments whose role, risks and potential you understand well enough to stay invested through different market cycles, while knowing when your original thesis needs to be reconsidered. There is no perfect investment personality. The real advantage comes from understanding your investment personality, as it can help you make more informed decisions and move closer to achieving your financial goals.

Reach for opportunities
of all sizes.
Across large, mid and
small caps.

Invest in
ICICI Prudential
Multicap Fund

ICICI Prudential Mutual Fund, Registration No.: MF/003/93/6

Download our App **i-Invest** | Visit: www.iciciprurf.com | Contact your Mutual Fund Distributor

ICICI Prudential Multicap Fund (An open ended equity scheme investing across large cap, mid cap, small cap stocks) is suitable for investors who are seeking for*:

- Long Term Wealth Creation
- An open ended equity scheme investing across large cap, mid cap and small cap stocks.

*Investors should consult their financial advisers if in doubt about whether the product is suitable for them.

The Risk-o-meter specified above will be evaluated and updated on a monthly basis.
