When prices differ, smart investors capture the spread

INVEST WITH ARBITRAGE FUNDS

Arbitrage Funds aim to benefit from price differences (or price spreads) between the cash and derivatives markets. By simultaneously buying a stock in the cash market and selling it in the derivatives market, these funds seek to capture the price spread between the two. By capturing these spreads, the strategy focuses on opportunities created by temporary market inefficiencies rather than relying on market direction. This approach can help limit exposure to broad market movements.

FIRST PAGE

A familiar drift

Dhirendra Kumar
Editor-in-chief

We have been here before. The flexi-cap category that our analysts now find sitting comfortably in large caps was itself created six years ago, as the regulator's answer to nearly the same complaint.

The episode explains why this was always likely and why it will happen again.

In 2020, SEBI examined multi-cap funds and concluded they were not living up to their description. These were sold as go-anywhere products, free to move across large, mid and small companies. Most had settled into large caps and stayed there. In the regulator's own words, they were not true to the label. The response was the obvious regulatory one: a rule requiring every multi-cap fund to hold at least 25 per cent in each of large, mid and small caps. The diversification investors thought they were buying would actually be there now.

The industry objected, lobbied and was offered a way out that, in hindsight, is revealing. Instead of holding the line, SEBI created a new category altogether. The flexi cap restored the old unconstrained freedom. Most multi-cap funds took the offer, changed their names, and carried on as before. For many schemes, the only real change was the name on the fact sheet.

Today's average flexi-cap fund

keeps around three-fifths of its money in large caps. That figure has moved very little over six years, which included a crash, a recovery and more than one bull market. The freedom handed back in 2020 has, for most funds, gone unused. The tendency the new category was meant to leave behind has reasserted itself within it.

This is the real reason the story deserves your time. It is not a story about flexi caps. It points to

- Flexi-cap funds became large-cap funds in disguise
- Fund managers always drift back to large caps
- Act carefully if your fund has quietly changed

a steady pull within active management that neither a fresh label nor a written rule has managed to counter.

The size of the money a manager runs, the career risk of straying from the benchmark, the comfort of holding familiar liquid names: all of these draw managers back to large companies and to the flavour of the day. I have seen this in every multi-cap and multi-asset category over three decades, from the old MIPs and balanced funds

to these latest ones.

You can rename a category. You can prescribe its allocations. You cannot force fund managers to have conviction.

A warning here. Regular readers know my usual position. In most months, the sensible response to analysis in these pages is to read it, take the point, and leave your portfolio entirely alone. The impulse to act on every new finding has harmed more investors than any market fall. That advice still stands.

But there is a difference between restless churning and keeping track of what you actually own, and this is one of those rarer occasions. Hopping between funds in pursuit of last year's best performer is the behaviour I warn against. Noticing that a fund you bought for its flexibility has gradually become a large-cap fund in all but name is something quite different. The holding is no longer the one you chose.

So read the cover story for what to examine and which alternatives might suit you. Read this for the reason it matters. On this occasion, the disciplined course is to act, not wait. Do it carefully, by directing fresh money towards a better-suited fund rather than overturning everything at once. Standing still and staying the course are usually the same thing. They are not always so.

DHIRENDRA KUMAR

Untangle 50 funds without the tax bill

How to consolidate a sprawling portfolio at little or no tax

A reader wrote to me recently with a confession that many investors would recognise as their own. He has been investing steadily for close to 25 years, with SIPs running without a break, which is exactly the discipline that all good financial advice tries to instil. There was only one habit he now regrets. Every year or so, when he noticed a fund doing better than the ones he was buying, he pointed his SIP money at the new winner, without ever touching what he had accumulated in the old one. He never sold. He only redirected. After two and a half decades of this, he owns more than 50 funds. The obvious tidy-up, selling the clutter and folding it into a handful of good schemes, would land him with a tax bill he had not bargained for. What, he asked me, should he do?

The first thing I want to say to him, and to everyone who recognises their own portfolio in his, is that the number 50 is a distraction. The question worth asking is not how many funds you hold. It is how many genuinely different things you own, and these are rarely the same number. An investor who keeps moving towards whichever fund has lately done well is drawn, almost by the nature of the exercise, to the same fashionable corners of the market again and again. So 50 line items on a statement frequently turn out to be six or seven real bets, each held several times over under different branding. The

portfolio looks sprawling. It is actually far more concentrated than it appears. Which means the work in front of him is smaller than the figure 50 suggests, and perhaps less urgent than the alarm it has provoked.

It is worth pausing on how a careful person ends up here, because there is nothing foolish in it. Moving your money towards what is working feels like attentiveness, not error. At every moment, it looks like the responsible thing to do. The trouble becomes visible only years later, in the aggregate: last year's best fund is seldom next year's, and the chase leaves a trail behind it, a string of half-finished holdings, none of them large enough to matter on its own. He was not careless. If anything, he was too engaged.

So what should he actually do? The most useful move requires no selling at all, costs nothing and triggers no tax: stop feeding the laggards from today. Every rupee of fresh SIP money can be pointed at the small number of funds that genuinely deserve to be owned. The remaining 40-odd holdings need not be exited. They need only to stop being fed. When done consistently, this one change consolidates the portfolio through attrition, as the good funds grow with new money and steady returns, and the abandoned ones shrink in relative weight, all without a single taxable transaction.

The backlog, the holdings he would actively

Moving money towards what is working feels like attentiveness, not error. At every moment, it looks like the responsible thing to do.

like to be rid of, is where patience will pay. Long-term gains on equity funds are taxed at 12.5 per cent only on the portion above ₹1.25 lakh in a financial year, and that exemption resets every April. A portfolio built one instalment at a time is not a single block. It is a long stack of tranches, each with its own purchase date and cost, and that granularity is an advantage rather than a complication: the poorer holdings can be unwound a slice at a time, kept within the annual exemption, so that the consolidation he dreads gets done over a few years at little or no tax. The funds that are both low-quality and modest in gains can go first, almost freely. The large, deeply appreciated ones deserve more thought, and that

thought belongs to him rather than to me.

There is one more relief that an old portfolio enjoys and a newer one does not. When equity gains became taxable again in 2018, everything that had accrued up to January 31 that year was left untouched. For any unit bought before that date, and across 25 years, that is the great majority of them, the cost the law recognises is not what he actually paid but the value as it stood at the end of January 2018. The growth of all the long years before then escapes tax entirely, however late he comes to sell. So the holdings he has owned the longest, the very ones he assumes would be the dearest to unwind, often carry a far smaller taxable gain than the figure on his statement would lead him to fear.

This kind of seeing is exactly what I built **Value Research Fund Advisor** to do. Our **Portfolio Analysis** is, before it is anything else, an instrument for revealing that 50 funds are really six. It lays bare the overlap and duplication that a statement is designed to conceal, so that you can tell genuine diversification from the same bet wearing different labels. Our Buy, Sell and Hold verdicts, and the shorter **Analyst's Choice** list drawn from within them, tell you which of your holdings are worth keeping and where your fresh money ought to flow, so the redirection I have described becomes a matter of judgement rather

A portfolio that looks untidy is not failing, and the urge to make it neat is an aesthetic goal, not a financial one

Illustration: Anand Kumar

than guesswork. And the tax view sits alongside all of it, showing the gain embedded in each fund, so the cost of every exit is visible to you before you make it, rather than being discovered painfully afterwards.

One thing is worth stating plainly. We earn nothing from your buying or selling: no commission, no cut of the transaction, nothing that improves for us when you trade more. The impulse to keep switching to the latest winner, the very impulse that quietly built this reader's 50 funds, is exactly the impulse a commission-funded advisor has every reason to encourage. We have none.

I would leave him and you with one caution. A portfolio that looks untidy is not failing, and the urge to make it neat is an aesthetic goal, not a financial one. There is no prize for owning a few funds, and no sense in paying real, irrecoverable tax to buy yourself the feeling of tidiness. What you should want is a portfolio that is doing its work: concentrated where it ought to be, free of the genuine duplicates and the genuine laggards and growing without demanding your anxiety, so that you sleep better at night. The 50 funds are not a confession to be ashamed of. They are a to-do list. And the first item on it costs nothing: redirect next month's instalment. ☑

*Total equity assets of all actively managed mutual funds. Data based on portfolio disclosures of March 2026 and April 2026. Passive funds have been excluded. Worth of shares bought and sold is based on month-end stock prices.

Move between market caps for more opportunities.

Choose Flexicap funds that aim to benefit from opportunities across large, mid and small caps.

A Flexicap fund has the flexibility to invest across large, mid and small cap stocks. This unrestricted nature of the fund enables the fund manager to pursue multiple investment opportunities across the market and tap them regardless of their size. Since they provide exposure to a broad equity spectrum i.e across market caps and sectors, it leads to a well-diversified portfolio striking a balance between risk and returns in a single portfolio.

To know more, speak to your mutual fund distributor/financial advisor for more advice on how flexicap funds can be part of every portfolio.

Letters to the Editor's Note

Your responses to the May 16 editorial,
When 'this too shall pass' doesn't

Anand Kumar/AI-generated image

Summary

Through the dotcom bust, the 2008 crisis, demonetisation, the Covid crash, the Ukraine war and every oil shock in between, one principle has generally held true: markets recover and investors are rewarded for staying the course. This time, however, Dharendra Kumar steps back from that familiar template.

The reason lies in the nature of the disruption. Most market crises are damage to sentiment. Prices fall, confidence evaporates and liquidity dries up. But the underlying economy remains intact. Factories

still operate, workers still work and productive capacity survives. These are mood swings inside a fundamentally healthy body. They pass. The US-Iran conflict is different. The damage is not to sentiment but to physical assets. If a meaningful share of global crude refining capacity is being destroyed, the consequences cannot be reversed by a change in mood. Oil-derived products—fuel, fertilisers, plastics and countless industrial inputs—can return only when refineries are rebuilt, pipelines restored and production resumes. That process takes years, not quarters.

For India, which imports more than 85 per cent of its crude oil, the impact is direct. Higher oil prices

Dharendra Kumar's Editor's Note, *When 'this too shall pass' doesn't*, published on May 16, 2026, argued that the US-Iran conflict differs from most market crises because it damages physical infrastructure rather than investor sentiment. He explained why disruptions to global energy supplies could have longer-lasting economic consequences than investors are accustomed to expecting.

The piece resonated with readers grappling with the uncomfortable possibility that some shocks do not fade quickly. And that patience, while still essential, may require a different set of expectations.

eventually filter through to fuel costs, fertiliser bills, construction expenses and household budgets. The same investor feels the pain twice: through a volatile portfolio and through reduced purchasing power. The more lasting damage may come not from market declines but from weaker corporate earnings caused by persistently high input costs.

This is not a call to abandon equities or react emotionally. It is a call to adjust expectations. Recovery may be slow, uneven and prolonged. Yet one foundation remains intact: every day, millions of Indians continue to work, save, consume and invest. For the long-term investor, that enduring economic engine still provides reason for confidence.

READERS' VOICE

What our readers say

“A truly insightful piece. My small observation is that much of this discussion depends on the extent of damage and its impact on oil prices.

While production capacities may have been disrupted by events around the Strait of Hormuz, I believe oil and gas companies are prepared to ramp up aggressively once conditions normalise. The damage is not irreparable and is unlikely to take decades to recover from. In fact, if sanctions on Iran are lifted, crude oil prices could even fall below pre-crisis levels. My hope is that stability returns within a few months and in a more positive direction than a negative one.

Kunal Sharma

“Your note immediately reminded me of the story of The Hare and the Tortoise. I have always tried to be the tortoise in my investment journey, believing

that patience and persistence eventually win. This war made me wonder whether the race should become a relay, with future generations carrying it forward! Jokes apart, the strong post-Covid rally created substantial wealth for many investors, while those trying to replicate the same strategy in recent years have struggled.

The challenge lies in assuming that India's growth story remains unaffected by global events.

While India has strong

fundamentals, factors such as Japan's interest rates, China's property market and the US-Iran conflict continue to influence our markets. Until we reduce our dependence on global developments, these external shocks will remain significant.

Sudha Devi Janga

“Very good observation and advice, considering that the global economy is slowly resetting itself to a new normal.

Living in Qatar, I can see the economic fallout that has engulfed the GCC and, by extension, much of the world.

Economic activity has slowed considerably, and hopefully, once the Strait of Hormuz is reopened, recovery can begin, albeit gradually. I feel investors should continue their SIPs, while more nervous investors may consider shifting some allocation to debt during this crisis.

Manoj Ashokan

“Since Covid, it feels as though every major challenge the world has faced has been unique in nature. Wars, however, are different because they bring physical destruction of both

property and human lives. AI-driven disruption has only added to the

uncertainty. Yet, as you rightly pointed out, market sentiment and reality are two different

things. The impact may last longer and recovery may take time, but as Charlie Chaplin said, “Nothing lasts forever. Even men die, and their actions fade away.”

Pavan Gadde

“I appreciate the disciplined investing mindset you encourage among readers. However, I believe investors also need to be

educated about larger macroeconomic realities—the true state of the economy, the

currency, industrial competitiveness, AI disruption and rising inequality. Simply asking people to continue SIPs may be useful for beginners, but more experienced investors also need honest discussions about slowing earnings, fiscal challenges and the country's long-term growth prospects. Financial awareness must go beyond investing and extend to understanding the broader forces shaping future returns.

[INSURANCE BASICS]

Your health policy got stronger

The rules are real. Most policyholders do not know they exist.

By Siddhant Madhav Joshi

You have probably seen the headlines. Cashless treatment at any hospital. A claim that cannot be turned down after five years of an active policy. A three-hour window to clear your discharge. The rules have moved fast and, on paper, in your favour.

But policies are not tested on paper. They are tested at the hospital billing counter, late at night, when someone you love is waiting to come home. The only question that matters: does any of this actually reach you?

A promise no one has to keep

Walk into any hospital, networked or not, and pay nothing upfront. That is the pitch. Cashless Everywhere was launched by the General Insurance Council, the insurers' own industry body, in January 2024. It is not a regulation. No order makes it binding. And it shows. In 2024-25, the first full year of the scheme, only about 58 per cent of health claims were settled cashlessly, by the regulator's own count. 4 in 10 policyholders still paid upfront and chased the money later. Promised everywhere. Mandated nowhere.

The three-hour rule that bites

This one is different, because this one has teeth. The IRDAI master circular of May 2024 gives your

insurer one hour to clear a cashless request and three hours to approve your discharge. Miss the three hours and the insurer pays the extra charge, not you. If a patient passes away, the insurer must settle at once and release the body without delay.

It is working. In a written reply to Parliament in December 2025, the government said close to 87 per cent of pre-authorisations were cleared within the hour.

But only about 58 per cent of claims go cashless at all. The rule works. Most people simply do not know it exists.

After five years, they cannot say no

Insurers once hunted for reasons to reject long-held claims. That weapon has been taken away. After five years of unbroken, active cover, your claim cannot be refused over something you failed to disclose, unless the

insurer can prove deliberate fraud. An honest mistake no longer costs you the claim. The waiting period for pre-existing conditions has also been cut from as long as 48 months to 36 months.

The rule is strong but enforcement is patchy. A 2025 review by advisory firm Beshak found some insurers had not updated their policy wordings to reflect it. The protection is real, but you may need to challenge the insurer to claim it.

The power is real. So is the work to claim it.

Keep your cover unbroken. Watch the clock during hospitalisation. If an insurer drags its feet, push back through the Bima Bharosa portal or the insurance ombudsman. The rules have shifted in your favour. Whether they work for you depends on whether you know they exist. [☑](#)

The trouble with InvIT yields

They promise attractive payouts but hide what you actually earn

By Siddhant Madhav Joshi

Amid the recent market turmoil, retail investors are looking for alternatives to equity. The search is bringing many to InvITs, or Infrastructure Investment Trusts. And for good reason. InvITs promise steady cash payouts on top of whatever the unit price adds. Annual yields ranging from 9 per cent to as much as 20 per cent in some cases naturally make them appealing to options like a fixed deposit or a debt fund.

The trouble is that the headline yield and what investors' actual pocketed returns are two different things.

And that is because of how an InvIT is structured.

What InvITs own

At its simplest, an InvIT is a trust that owns income-producing infrastructure and passes the cash from those assets to its unitholders. Buying an InvIT is really three decisions rolled into one: which asset class, which counterparty (entity on the other side of the contract), and which concession profile (terms and duration of the agreement).

The nine listed InvITs sort into three buckets on this basis.

Transmission: IndiGrid and PowerGrid InvIT own

Mukul Ojha/AI-generated Image

electricity transmission lines and earn tariff-based, regulated returns from central and state utilities, on contracts that can run 35 years.

Roads: Six trusts sit here. The money comes either from toll collections or from hybrid annuity contracts, where the government pays a fixed annuity to operate the road before it reverts to the state. NHAI is the counterparty either way.

Gas pipelines: Energy Infrastructure Trust is the only publicly listed trust, earning transmission tariffs from a small set of anchor shippers tied in over a fixed term.

Each carries its own revenue model, counterparty

What the headline yield hides

Distribution and total return on ₹10 lakh invested at listing

InvIT	Listing date	Net distributable cashflow (NDCF)				Cap. appreciation		Actual return (XIRR, % pa)
		Total distribution received (₹ lakh)	Interest share (%)	Dividend share (%)	Return of cap. share (%)	on original inv. (₹ lakh)	Headline yield (%)*	
IRB InvIT	May 18, 2017	7.9	70.8	2.7	26.5	-4.1	10.9	5.6
IndiGrid	Jun 6, 2017	11.7	84.5	2.4	12.4	6.9	9.4	17.1
Energy Infra Trust	Mar 20, 2019	11.6	53.4*	–	46.4	-2.4	19.7	15.5
PowerGrid InvIT	May 14, 2021	5.6	63.7	22.6	13.4	-0.8	13.1	10.2
Vertis Infra Trust	Aug 25, 2022	5.7	31.0	31.4	37.1	0.8	11.1	18.5
Indus Infra Trust	Mar 12, 2024	2.8	51.7	26.2	21.8	2.3	10.9	23.1
Capital Infra Trust	Jan 1, 2025	3.3	12.2	65.6	22.1	-2.9	13.2	3.9

Returns are calculated on an XIRR basis. Terminal value is the closing market price as of May 22, 2026. *Headline yield calculated on the last four distributions. Energy Infrastructure Trust reports a combined "return on capital" rather than splitting interest and dividends. Anantum Highways Trust and Raajmarg Infra Investment Trust are excluded owing to limited trading history.

FUND RADAR

risk and asset life. These differences determine the nature of their income and the risks that we come to later.

The distribution myth

Most people assume InvIT distributions behave like a dividend from a stock or a coupon from a bond. But their structure makes it different.

What an InvIT pays out is net distributable cash flow, or NDCF: the cash from the underlying assets left after the debt is serviced. SEBI requires at least 90 per cent of this to be distributed to unitholders each quarter. But this payout has three components:

- Interest the InvIT earns on loans given to its subsidiaries or special purpose vehicles (SPVs)
- Dividends those SPVs pay back and,
- Principal repayments, or return of capital

That last piece is the one investors miss. It is their own capital, pooled and lent to SPVs, and handed back as part of the payouts. In simple words, a part of your capital comes back to you disguised as income.

If a large part of the payout is coming from this component, the headline yield can look high even though the investor is not earning as much. The higher this component, the more inflated the yield may be.

The actual return

A more honest and useful measure is XIRR, which weighs the size and timing of every cash flow along with the change in unit price, telling you what you are

actually earning.

IRB InvIT paid a distribution yield of 10.9 per cent over the past year but has compounded at just 5.6 per cent since listing. Capital Infra Trust boasts 13.2 per cent; its actual return is 3.9 per cent. In both cases, the headline yield looks better than the actual return, partly because of the return-of-capital component.

However, IndiGrid tells the opposite story. Its yield is a modest 9.4 per cent yet it has delivered 17.1 per cent a year since listing, its small return-of-capital share topped up by a rising unit price. The funds that look least exciting on yield have, in several cases, made their unitholders the most money. A fat yield says very little about what you actually earn.

A tricky asset for retail investors

InvITs are also harder for retail investors to analyse than REITs, which are more retail-friendly. Four risks make this clear.

1) Asset life: A REIT owns perpetual assets. Buildings hold their value, leases renew, properties can be rebuilt, and the terminal value can even grow. An InvIT owns finite-life assets bound by a contract that eventually runs out. As the tenure winds down so does the value, dragging on the unit price and future payouts.

2) Counterparty concentration: A typical Indian REIT spreads its rental income across more than a hundred tenants, so one default barely registers. An InvIT leans on a handful: NHAI for roads, state utilities for transmission, a few anchor shippers for gas. Each requires an independent credit assessment.

3) Liquidity: The median listed InvIT sees volumes worth about ₹5.36 crore a day against ₹13 crore for the median REIT, on a six-month average, roughly a third of the volume. Exiting a sizable position at a fair price in a jittery market is that much harder here.

4) Tax: Each component of the distribution is taxed differently. The resulting compliance burden is not trivial. See table: How InvIT distribution is taxed.

How InvIT distribution is taxed

Different components of the payout attract different tax treatment

Components of NDCF	Tax liability for unitholders
Interest earned by InvIT on loan given to SPV	As per applicable tax slab
Dividends from SPV*	Tax-exempt
Repayment of loan given to SPV (return of capital)	Tax-exempt, but reduces unit value
Capital gains on selling InvIT units (held more than one year)	Gains above ₹1.25 lakh taxed at 12.5%
Capital gains on selling InvIT units (held less than one year)	Gains taxed at 20%
Other income (if any)	As per applicable tax slab

*If the underlying SPV has opted to pay tax under the concessional Section 115BAA regime, the dividend is taxable at the unitholder's slab rate.

Should you buy them?

Not directly. Institutional investors examine contract terms, asset life, counterparty credit strength, cash flows and liquidity before investing. Most retail investors cannot. The listed universe is still thin and several names are too new to judge.

The better route for those who want exposure is a mutual fund with a sizable InvIT allocation. You get the diversification and the institutional legwork, without betting your money on a headline yield alone. [☑](#)

MUTUAL FUND INVESTMENTS ARE SUBJECT TO MARKET RISKS, READ ALL SCHEME RELATED DOCUMENTS CAREFULLY.

Is your active fund ‘active’?

Being different from the index may not be the same as beating it

By Abhishek Rana and Harshita Singh

Every active fund manager makes the same implicit promise: their portfolio will look different from the index and that difference will be worth the higher expense ratio you pay. A simple metric that measures this difference is active share. It tells you how much a portfolio differs from its underlying benchmark. One can calculate it by adding the difference between each security’s weight in the fund and in the index, and dividing the sum by two. See table: How to arrive at a fund’s active share.

An active share of 80 per cent means the portfolio is roughly 80 per cent different from the index and that the fund manager is taking substantial active calls. A fund with a 10 per cent active share is more or less an index fund.

Since higher active share indicates more active management, it is reasonable to think that such funds should outperform their benchmarks, with greater divergence driving better returns. But as our exercise in this story shows, that is not reliably the case.

The active share test

We started by identifying the five most and least active funds from the flexi-cap, large & mid-cap, value-oriented, and ELSS categories, based on their average active share over the past one year. Only funds with at least four years of history were included to ensure consistency with the later analysis, which uses three-year rolling returns from April 2025 to April 2026 effectively covering a four-year period.

See their names in tables: Binary outcomes and Steady as they go. We then checked the three-year rolling returns of both groups, comparing each fund’s performance to its benchmark and counted how often each beat its benchmark.

A tale of two extremes

For the five highest active-share funds, the results split cleanly down the middle. Two beat their benchmark 100 per cent of the time. The other three failed to do so in even a single period. There was no middle ground here. These funds either delivered consistently or did not deliver at all, disproving the expectation that greater

Apurajita Anushree/AI-generated Image

How to arrive at a fund’s active share

Stock	Benchmark weight (%)	Fund weight (%)	Absolute difference (%)
A	0	20	20
B	30	20	10
C	20	40	20
D	10	0	10
Total absolute difference			60%
Active share (Sum/2)			30%

For illustration purpose only.

independence from the index should certainly translate into outperformance.

The five lowest active-share funds told a different story. Four of them beat their benchmarks 75 to 100 per cent of the time. This may seem puzzling but it

Binary outcomes

Of the five most active funds, only two beat their benchmark every time

Fund	Active share (%)	AUM (₹ cr)	Expense ratio (%)	Beat index (% of times)
Samco Flexi Cap	95.6	286	0.98*	0
Motilal Oswal ELSS	94.5	4,659	0.62	100
Quant Value	93.0	1,756	0.48	100
Motilal Oswal Focused	91.7	1,509	0.86	0
LIC MF Focused	91.4	158	1.09	0

Based on average active share (May 2025–April 2026). Includes active flexi-cap, large & mid-cap, ELSS and value-oriented funds with at least a four-year track record. Performance margin against BSE 500 TRI, based on three-year rolling returns (April 2025–April 2026). AUM and expense ratio as of April 30, 2026. *Total Expense Ratio considered; Base Expense Ratio used for remaining funds.

is not. The closer a fund stays to the benchmark or the less it diverges, the less likely it is to underperform.

What the funds in between show

But before concluding that low active share wins, consider the funds in between. The five biggest funds by size had an average active share of 61 per cent, sitting in neither of the two groups and still beating their benchmarks 100 per cent of the time. What this simply means is that the number of outperformers appear across all active share levels. This shows how the metric cannot be concretely relied on to judge a fund's index-beating potential.

Fund performance ultimately depends on the quality of the manager's stock picks, not just how different the portfolio is from the index. A fund with almost nothing

The price of being different

Five most active funds swing harder in both directions

Three-year beta as of April 30, 2026 calculated for each of the five most active and least active funds.

Steady as they go

Staying close to the benchmarks kept four of the five funds ahead of them

Fund	Active share (%)	AUM (₹ cr)	Expense ratio (%)	Beat index (% of times)
Canara Robeco Flexi Cap	45.4	13,083	0.50	75
Edelweiss ELSS	47.8	437	0.70	100
Axis ELSS	48.3	31,566	0.70	0
Edelweiss Flexi Cap	48.4	3,320	0.44	100
Canara Robeco ELSS	48.6	8,529	0.56	83

in common with the index can still be a poor performer if its bets were simply bad. High active-share funds thus offer no guarantee of outperformance. And they also come with a feature investors should factor in: greater volatility.

Active share and volatility move together

We checked the three-year beta of all funds in the two groups. Beta measures how much a fund moves relative to its benchmark. A beta of 1.2 for example means if the benchmark rises 10 per cent, the fund tends to rise around 12 per cent and falls proportionally more when the market drops.

The five high active-share funds in our sample showed noticeably higher beta. When the market rose, they rose more sharply. When it fell, they fell harder. The lowest five active funds showed comparatively muted swings. This is not a surprising finding. It is a natural consequence of how these funds are built. A fund that holds positions far from the index is, by construction, exposed to risks the index does not carry. Its returns will swing more, in both directions.

The right way to read active share

Active share is a diagnostic, not a return predictor. A high active share confirms a manager is making genuine independent bets. It says nothing about whether those bets will work. The biggest variable in deciding performance is the fund manager's skill. This is why active share must be read alongside returns and expense ratio. A fund with high active share, a high expense ratio, and persistent benchmark underperformance warrants a second look. Similarly, use it to identify disguised index funds that mirror benchmarks but charge active fees. ☒

A side door to global equities

GIFT City is a new route for Indians to invest abroad, but with conditions

By Siddhant Madhav Joshi

Try starting an SIP in an international mutual fund today. Most schemes will refuse the order. The RBI's industry-wide \$7 billion-cap on overseas investment by Indian mutual funds was breached in early 2022. Since then, fresh inflows into international schemes have been shut, reopened briefly, and shut again. The workarounds are painful. Foreign brokerage accounts mean paperwork and complicated tax filings. Indian-listed international ETFs trade at chronic premiums.

In 2025, a different door opened: GIFT City funds. There

Nitin Yadav/AI-generated Image

What GIFT City has to offer

Seven vehicles, two-way flows. Inbound funds route capital into India, outbound funds route Indian capital abroad.

VC: Venture capital; AIF: Alternate investment funds.

are now four of them for retail investors, offering a regulated route for resident Indians who want to invest abroad. This guide explains how they work, what they cost, and who they are right for.

What GIFT City is and what it offers

GIFT City investment products are not regulated by SEBI like ordinary domestic mutual funds. They are regulated by the International Financial Services Centres Authority, or IFSCA.

The wider GIFT City fund universe includes several products, but most are not meant for ordinary Indian investors. Restricted schemes, portfolio management services, and special situation funds require a minimum ticket of \$150,000 and are largely targeted at institutions

A FLEXIBLE INVESTMENT APPROACH TO HELP YOU MOVE TOWARDS YOUR GOAL.

Invest now in Canara Robeco Flexi Cap Fund.

CANARA ROBECO FLEXI CAP FUND

(An open-ended dynamic equity scheme investing across large cap, mid cap, small cap entities)

Focuses on investing in companies that present growth opportunities across diverse industries. Provides flexibility to investor's portfolio and creates an opportunity for growth and wealth creation across a wider base of investments.

This product is suitable for investors who are seeking*:

- Capital appreciation over long term
- Investments in equity and equity related instruments across large cap, mid cap, small cap entities

*Investors should consult their financial advisers, if in doubt about whether the product is suitable for them.

The Scheme riskometer is evaluated on a monthly basis and the above riskometer is based on the evaluation of the portfolios for the month ended May 29, 2026.

Mutual Fund investments are subject to market risks, read all scheme related documents carefully.

Retail outbound funds at GIFT City

These funds together have already routed ₹416 crore of Indian wealth abroad

Fund name	Strategy	Underlying exposure	Inception	Min investment	Expense ratio (Direct)	Exit load	AUM
DSP Global Equity Fund	Active	MSCI ACWI Net TRI	Sep 18, 2025	\$5,000 + \$500 increments	Up to 1.00 per cent	1% (within 24 months)	\$28 million
Parag Parikh IFSC S&P 500 FoF	Passive FoF	S&P 500 Net TRI (Invesco UCITS ETF)	Mar 20, 2026		0.30 per cent	Nil	\$6.43 million
Parag Parikh IFSC Nasdaq 100 FoF	Passive FoF	Nasdaq 100 Notional Net TRI (Invesco UCITS ETF)	Mar 20, 2026		0.30 per cent	Nil	\$7.44 million
Edelweiss Greater China Equity Fund	Active FoF	MSCI Golden Dragon Index (feeder into JPMorgan Greater China Fund)	Mar 10, 2026		0.80 per cent	2% (within 395 days) 1% (between 395 and 760 days)	\$1.82 million

Data as of April 30, 2026. Expense ratio of FoFs excludes underlying-fund charges: PPFAS S&P 500 FoF (extra 0.05 per cent at Invesco UCITS ETF), PPFAS Nasdaq 100 FoF (extra 0.20 per cent at Invesco Nasdaq-100 Swap UCITS ETF), and Edelweiss Greater China Equity Fund (JPMorgan Greater China Fund charges).

and wealthy investors. Retail investors have access to only two categories: retail schemes and ETFs. The minimum investment is \$5,000, or roughly ₹4.8 lakh, which is still a sizable starting point.

GIFT City funds are also split by direction. Inbound funds invest

in Indian assets and are open only to non-residents. Outbound funds invest abroad. The focus of this article would be on the retail outbound funds which are currently four in number. Investment in them happens under the RBI's Liberalised Remittance Scheme, or LRS,

which allows resident Indians to remit up to \$250,000 per financial year abroad. Your GIFT City investment counts against this limit.

The current retail universe

The existing four:

- Parag Parikh IFSC runs two passive fund-of-funds, one tracking the S&P 500 and one the Nasdaq 100, both via Invesco UCITS ETFs listed abroad.
- DSP IFSC runs an actively-managed global equity portfolio benchmarked to the MSCI ACWI index.
- Edelweiss IFSC runs an active feeder fund investing in JPMorgan's Greater China strategy.

Together, these four funds had assets of about \$43.7 million, or roughly ₹416 crore, as of April 30, 2026, about the size of a small flexi-cap fund in India. IFSCA's December 2025 data shows in total nine retail schemes have received licences indicating more schemes may launch soon.

Inside the four portfolios

Tech-heavy funds lead. The fund that diversified away from tech trails.

Fund name	No. of holdings	Return since listing (%)	Largest sector allocation	Regional diversification
DSP Global Equity Fund	27	-4.5	Internet and Media (18.1%)	● United States (29.0%) ● China (15.6%) ● Taiwan (4.9%) ● United Kingdom (4.5%) ● Singapore (2.1%) ● Japan (1.8%)
Parag Parikh IFSC S&P 500 FoF	500	12.2	IT (32.3%)	United States focused
Parag Parikh IFSC Nasdaq 100 FoF	100	20.4	IT (50.2%)	United States focused
Edelweiss Greater China Equity Fund	135	15.0	IT (47.5%)	● China (51.2%) ● Taiwan (45.2%) ● Hong Kong (2.9%)

How to invest in GIFT City funds

From remittance to redemption, the path in five stages

Early return snapshot

None of these funds is older than a year. Short track records in markets as volatile as global equities tell you very little. With that caveat: Parag Parikh's Nasdaq 100 FoF is up 20.4 per cent since listing. Edelweiss Greater China is up 15 per cent. The PPFAS S&P 500 FoF is up 12.2 per cent. DSP Global Equity is down 4.5 per cent, the only underperformer. Its diversified MSCI ACWI benchmarked active portfolio management style missed the US tech rally that drove the other three. But these records are too short to judge the quality of these funds.

How the money moves: LRS and TCS

When you invest in a GIFT City fund, you remit money from your Indian bank account in dollars under the LRS. If you remit more than ₹10 lakh in a financial year, your bank collects tax collected at source (TCS) at 20 per cent on the amount above that threshold. However, you can claim it back when filing your return if you lie

below the 20 per cent tax bracket. It does, however, block that capital until you file. On redeeming your investments, you receive dollars, which are converted to rupees at the prevailing exchange rate before being credited to your account.

How taxation works on GIFT City funds

You do not pay tax directly on your GIFT City fund gains. The fund pays tax at the fund level using its own PAN. You receive proceeds net of tax and declare them as exempt income in your return. Less compliance, but the tax burden is still yours.

The headline tax rates are similar to domestic international funds with one important difference: GIFT City funds attract surcharge at the highest tax bracket, making the effective rates higher.

On long-term capital gains: If you earn over ₹50 lakh, and sell an investment after 24 months, your effective LTCG rate is 14.95 per cent after surcharge versus 12.5 per cent in India-based

international funds.

On short-term capital gains: If you sell within 24 months, you are taxed at the 30 per cent slab regardless of your income. After surcharge, the effective STCG rate becomes 42.74 per cent versus 31.2 per cent in domestic international funds for someone in the highest income tax bracket.

On dividends: The effective rate here is 35.88 per cent against the applicable slab rate plus cess for a domestic international fund investor.

In short, for high-income investors (below ₹50 lakh annual income), the tax on long-term gains from GIFT City funds and domestic international funds differs by roughly 2.5 percentage points, meaningful but not ruinous. But for short-term investors at any income level, the tax is charged at the highest slab, and after surcharge, it becomes more punishing.

How redemption works on two NAVs

The four funds publish two redemption NAVs daily: a short-

[FUND RADAR]

term NAV and a long-term NAV. The long-term NAV applies if you redeem after 24 months. The short-term NAV applies if you redeem before that. The short-term NAV is lower.

Why this penalty for early sellers? Because when the fund sells investments to meet early redemptions, it would trigger a high short term tax liability at the fund level. If that cost were spread across all investors, long-term holders would effectively pay for someone else's early exit. Instead, the fund recovers this cost from the exiting investor through a lower redemption NAV. The early seller bears the cost of early selling.

A simple example: say you invest at \$100 per unit. The fund grows and the long-term NAV is \$115. If you sell before 24 months, you redeem at the short-term NAV—say \$113. The \$2 gap is roughly the cost the fund pays on your exit, recovered from you. Wait past 24 months and you redeem at \$115, or whatever the actual NAV is at the time.

This structure protects long-term investors and makes early exits expensive.

Three questions before you invest

Does \$5,000 fit your portfolio? At roughly ₹4.8 lakh, this is a meaningful sum. Global exposure for most investors should be between 10 and 30 per cent of their equity portfolio. That makes this route appropriate only for someone with an equity portfolio of at least ₹16 lakh. Below that scale, a GIFT City investment distorts your asset mix.

Can you hold for at least two years? Between the short-term NAV penalty, the 42.74 per cent effective STCG rate, and exit loads that many funds charge, this route punishes impatience.

What is the actual cost? Three of the four funds are fund-of-funds, which means two layers of charges. The Parag Parikh S&P 500 FoF, for example, charges 0.30 per cent at the FoF level plus 0.05 per cent inside the underlying Invesco ETF. The headline expense ratio reflects only the outer layer. Check both before investing.

The bottom line

GIFT City funds give resident Indians a clean, no-queue route to global equity exposure but only for patient investors with a large enough portfolio and a long enough horizon that make the extra tax worth bearing. ☒

My approach changed from just investing to planning comprehensively

How a health scare reordered my financial priorities

By my mid-thirties, I felt I had most elements of personal finance in place. My portfolio was growing steadily, SIPs were running regularly and I had a fair sense of where I wanted to be a decade later. My wife and two children seemed well provided for or so I believed.

Then my father-in-law suffered a sudden cardiac episode. He survived, thankfully. But the weeks that followed hospital bills, borrowed funds and financial strain, left a lasting impression.

One thought kept returning: what if this had been me?

That question led me to review my finances through a different lens. On the surface, everything seemed fine. Investments were on track. But beyond returns, some gaps were hard to ignore. My health cover depended entirely on my employer, my life insurance was minimal and there was no clear contingency plan.

More importantly, what I had wasn't really a plan, it was a collection of investments.

That distinction became crucial. I had focused on wealth creation, but not on securing my family across different life situations. My portfolio assumed everything would go as expected. It wasn't built to handle uncertainty.

A conversation with a financial

advisor brought clarity. The key insight wasn't about products, but perspective. Financial planning isn't about choosing between investments and insurance, it's about aligning both with life's risks and responsibilities.

We broke it down into four pillars:

Pillar	Purpose
Protection	Life and health insurance against income loss or medical shocks
Growth	Investments for long-term wealth creation
Liquidity	Emergency funds for short-term needs
Goals	Clear mapping of education, retirement and lifestyle needs

Seen this way, the imbalance was clear. Growth had been prioritised, while protection and liquidity were underdeveloped. Goals lacked clarity.

The changes that followed weren't

dramatic, but they were deliberate.

I put adequate life insurance in place, added health cover independent of my employer and built an emergency fund to handle a few months of expenses without touching long-term investments.

At the same time, I revisited my portfolio with more intent. Instead of building a generic corpus, investments were aligned with specific goals, children's education, retirement and key milestones.

Individually, these steps were simple. Together, they reshaped how my finances were structured. What once felt scattered began to resemble a clear plan.

The first outcome was clarity. The more meaningful one was peace of mind.

Conclusion

Financial planning is often seen as either investing or buying insurance. In reality, it is the combination of growth, protection, liquidity and goal alignment that creates resilience.

Investments help us move forward. Protection ensures setbacks don't push the family backward. Liquidity may help manage uncertainty.

A well-built portfolio matters. But a well-structured plan ensures that what is being built today remains secure, even when life does not go as expected. 

Key takeaways

- Investments create wealth, but wealth alone does not ensure financial security
- Insurance is one component of a broader financial planning framework
- Emergency liquidity is as critical as long-term growth
- Financial planning requires alignment of growth, goals, and risk coverage
- A complete plan prepares you for both success and uncertainty

SEBI Reg: LIC Mutual Fund | Reg No: MF/012/94/05. How women invest today

What the latest CAMS report reveals about the changing investment habits of women

For years, women were seen as conservative investors who preferred traditional avenues like fixed deposits. The latest data suggests this is changing. In its recent report, *Going Beyond the Box*, CAMS highlights the growing role women are playing in India's mutual fund industry. Women now hold ₹11.3 trillion in mutual fund assets across CAMS-serviced funds, up from ₹10.0 trillion a year ago. Their assets grew 13 per cent, compared with 11 per cent for men.

The shift is visible in how women invest, not just in how much. Equity and hybrid funds account for 82 per cent of their assets, with hybrid funds seeing the fastest growth. SIPs have gained traction too, with 58 per cent of women investors having at least one active SIP. Meanwhile, 45 per cent of women investors now come from beyond the top 30 cities.

The portfolio is going beyond the box

One interesting insight is the rise of a “multi-asset

Where the money sits

The **flexi-cap tax** you didn't know you were paying

By Pranit Mathur

“WHAT’S IN A NAME?”

For flexi-cap fund investors, a great deal. The category name promises flexibility, the freedom to move across the market and chase returns anywhere, with nothing in the rulebook to stop them. This free hand, partly, explains why investors have been fond of the category, flooding it with more money than any other diversified equity category in the last three years.

Yet most of these funds are barely using their free rein. The portfolios have drifted into large caps and stayed there, barely moving through crashes, recoveries and bull runs. That drift

has come at a cost: investors have quietly paid a tax for staying invested, the price of holding a flexi-cap fund that behaves like something else. The pages that follow examine why this tax exists, and what state the freedom promise is really in.

Promise of freedom

The category’s flexibility was designed, not stumbled into. When SEBI reorganised fund categories in 2020, it had a problem with multi-cap funds: sold as go-anywhere products, they had quietly drifted into large caps. So it ruled that every multi-cap fund

must hold at least 25 per cent each in large, mid and small caps. The flexi-cap category arrived two months later with no such rule. It had a single mandate: to keep 65 per cent of its money in equity, and could invest the rest wherever it chose. Alone among the diversified categories, it kept the right to roam the whole market.

That right exists for one reason: to earn you more. A manager free

Kamal/AI-generated Image

to roam can do two things an index cannot. They can lean into smaller companies where bargains are easier to find and crowd into whichever sector is leading. Used well, that should beat a simple index and decisively so. But flexi caps over the last two decades have gradually lost that upper hand, more and more.

The freedom has stopped paying

The simplest measure of whether the freedom is working is a fund's alpha: the margin by which it beats its benchmark, after adjusting for the risk it took. If the flexibility is doing its job, that number should be comfortably positive. In the category's early years, it was. Not any more.

The chart 'The edge that faded' tracks the average flexi-cap fund's alpha back to 2004. In the early years, its three-year alpha ran high, between 6 and 12 per cent. Over time it normalised to 1 to 3 per cent. Since about 2018, as retail money poured in through discount brokers and the market

Flexi caps kept the one thing all other diversified funds gave up: the freedom to go anywhere

The edge that faded

Alpha of an average flexi-cap fund has been falling over the years

Three-year rolling alpha of an average regular flexi-cap plan over the BSE 500 TRI, after adjusting for risk. Classification as per AMFI.

grew more efficient, it has hovered between zero and 1 per cent, at times slipping below zero. So the edge has not crashed but it has reduced, from something worth paying for to next to nothing. An investor in the average flexi-cap fund today is barely ahead of the BSE 500, the very benchmark it is measured against. That can be traced to how the category has grown stagnant instead of using its flexibility.

Stuck on large caps

Look first at what the average flexi-cap actually holds. Today it keeps around 62 per cent of its equity in large caps, 19 per cent in mid caps and 19 per cent in small caps. That 38 per cent in mid and small is not nothing. A pure large-cap fund, required to hold at least 80 per cent in large caps, cannot offer it. So a flexi cap is not secretly a large-cap fund.

But the right test is not what it holds, but how far it dares to stray from its large-cap heavy benchmark. That is where the freedom shows up, and that is

what has faded. An average flexi-cap's large cap exposure was over 20 percentage points lower than the BSE 500's two decades ago. But today that gap is below 10 points. See chart 'Less brave by the year'.

The gap did not narrow because the manager grew bolder. It

narrowed because the benchmark's own large-cap weight fell, from about 84 per cent to 72 per cent due to mid and small companies growing larger and more liquid. Flexi caps' share of large caps, however, barely moved. They were handed more room to roam and used less of it.

The mix has also barely shifted across very different markets, through bull runs, falls and recoveries alike. It stays put whatever the market does. The freedom, then, is going unused and it inevitably hurts returns.

Why flexi-cap alpha has compressed

They stay where the edge is hardest to find. So most of a flexi cap's money sits in large caps. That would matter little if large caps were a good place to hunt for an edge. They are not, and less so each year.

Alpha comes from knowing something the market has missed.

Less brave by the year

Flexi caps now sit far closer to the index

Before October 2017, large caps are considered as the top 100 stocks by market capitalisation within the BSE 500; from October 2017 onwards, AMFI classification of stocks is used, following AMFI categorisation for funds. Analysis is based on the regular plan of an average flexi cap fund. All data is as of March 31 each year. Source: BSE, NSE, AMFI.

Large caps are the most closely watched corner of the market and the least likely to hide a bargain

That is hard when everyone is looking in the same place. According to a July 2025 report by PGIM India Alternatives, the average large-cap company in India is followed by 27 analysts. The average small cap is followed by eight, a micro cap by just two. Close to two-thirds of small and micro caps have no analyst watching them at all. The neglected corners are where mispriced bargains are most likely to hide. And that is where flexi caps venture less.

The market is more efficient today. Trading has also made large

caps harder to gain from. Annual turnover in India's markets has roughly tripled in a decade, to more than ₹22 lakh crore. See chart 'The crowded marketplace'. More money and more eyes push large-cap prices closer to fair value, leaving less room for a manager to add anything. A flexi cap with most of its money in large caps is fishing in the most crowded pond, and wondering why it catches so little.

For large flexi caps, size is a problem. The biggest funds cannot buy enough of a small company to make a difference to their returns.

Two limits hem them in: a fund cannot put more than 10 per cent of its money in one stock, and an AMC cannot own more than 10 per cent of any company. So as a fund's success swells its size, it is pushed towards large, liquid names. Call it the winner's curse.

The human factor. Another reason is the fear of straying from the pack. A manager measured against a large-cap-heavy benchmark has little reason to move far from it. A bold mid- or small-cap call can lift the fund if it works, but wound it badly if it fails. Hugging the benchmark is safer.

Favouring quality has a cost.

There is one more factor, and it works only some of the time. An active fund, by its nature, leans towards quality. A manager's research is meant to keep weaker companies out, and that is part of what active management promises. But the same tilt can

Flexi caps offer a sliver of protection when markets fall and pay for it with the gains that happen when the market recovers

hurt returns when the market rewards other factors instead.

A useful gauge is the Nifty 500 Quality 50, an index of the 50 strongest stocks by return on equity, low leverage and earnings growth. Compare its three-year rolling returns with its parent and a pattern appears: when quality beat the broad market, more flexi caps beat their benchmark; when quality lagged, so did they. Over the past decade, as the market favoured quality less, fewer flexi caps managed to outperform. See chart 'Quality calls the tune'. This, though, is only part of the story, and the smaller part.

The structural problem is the one we began with: the freedom is being spent where an edge is

Quality calls the tune

When quality fades, fewer flexi caps are able to stay ahead

Performance margin of the Nifty 500 Quality 50 TRI over the Nifty 500 TRI considered. Analysis based on average of daily three-year rolling returns for the year. Categorisation as per Value Research classification.

scarce. A flexible mandate does not guarantee a flexible portfolio. For that, investors need a structure that takes the choice out of the manager's hands.

Two funds that take the choice away

If the trouble is that a flexi-cap manager can avoid mid and small caps, the remedy is a fund that does not let them. Two categories do exactly that, by rule.

A **multi-cap fund** must keep at least 25 per cent each in large, mid and small caps. The manager is free to place only the final quarter wherever conviction points. At least half the portfolio, therefore, sits outside large caps, no matter how nervous the manager feels.

A **large and mid-cap fund** must

hold at least 35 per cent each in large and mid caps. Small caps are optional, but a heavy mid-cap base is guaranteed at all times.

The difference from a flexi cap is not the manager's talent. It is who decides the cap mix: the manager, or the regulatory -mandate. In flexi caps, it is left to the manager's judgment, and that judgment, as we have seen, rarely changes. In these two categories, the rulebook decides it. The next sections show what that one difference is worth.

Why mid and small caps earn their place

Why insist on a mid- and small-cap allocation at all? Why not simply trust the manager? Three reasons and they build on one another.

What large caps leave out

Sectors where mid and small caps offer sizable different allocations

Based on avg allocation from May '25 to Apr '26 in Nifty 100, Nifty Midcap 150 & Nifty Smallcap 250 indices

COVER STORY

About this comparison

We measured the average flexi-cap fund against the multi-cap and large and mid-cap indices, not category averages. Multi-cap funds got their fixed structure only in 2020, and market-cap definitions for all three took effect in 2018. Category averages are too young to test across full market cycles, while the indices cover every phase of the past two decades. Read it as a structural comparison: one portfolio is free to drift towards large caps, while the other two must hold meaningful mid- and small-cap exposure.

1 Broader sectoral spread

Different market-cap buckets represent different parts of the economy. The large-cap, mid-cap and small-cap universes do not carry the same sector mix. Large caps are more concentrated in financial services, energy and technology. Move down the size curve, and sectors such as capital goods, healthcare, chemicals and services get a bigger presence. A fund that skips mid and small caps is not merely avoiding smaller companies. It is skipping whole industries and often the ones growing fastest. The table 'What large caps leave out' lays the gaps bare.

2 They are better in rallies, barely worse in falls

Across the last two decades, the multi-cap and large and mid-cap indices have generally outpaced the typical flexi-cap during market rallies. In the bull run from late 2020 to late 2021, for instance, the

Knowing what you own is most of the work. The rest can be done patiently, one fresh investment at a time.

62 per cent. The table 'Slow off the bottom' shows the pattern across rebounds.

The flexi-cap wins in only one phase, and only by a little. When markets fall, its large-cap weight cushions the drop, so it loses marginally less. In the 2020 crash, it fell about 36 per cent against the multi-cap index's 37.4 per cent. The table 'Large-cap cushion in troughs' tracks the falls.

So the trade-off is clear. A flexi-cap investor gives up extra gains in strong and recovering markets in exchange for slightly better downside protection during rough patches.

3 They create more wealth over decades

This trade-off compounds over the

long term. On the fairer test of rolling 10-year SIP periods, the multi-cap and large and mid-cap indices have stayed consistently ahead of the average flexi-cap fund. The lead has widened to as much as four percentage points a year in recent stretches as the chart 'Flexibility did not win the decade' makes plain. That may not sound like much but compounded over a lifetime, it is the difference between two very different retirements.

Take a monthly SIP of ₹10,000 continued for 20 years. The total investment would be ₹24 lakh. In the average flexi-cap fund, it grew to about ₹93 lakh. The same SIP grew to about ₹1.2 crore in the multi-cap index and about ₹1.25 crore in the large and mid-cap index. That gap

of about ₹30 lakh, on the same monthly outgo, is the tax investors paid by staying invested even as these funds drifted towards large caps. See the second chart in 'Flexibility did not win the decade'.

Not every flexi cap is guilty

None of this means abandoning flexi caps. The drift is a tendency, not a rule, and many funds resist it. We tracked 79 flexi-cap funds with a one-year record, following their portfolios from January 2020. Eleven held their large-cap allocation below two-thirds throughout. Another 22 crossed that line only rarely, less than a third of the time. So over a third of the category has stayed true, still using the freedom investors paid for.

The lesson is not to sell, but to look. A fund that uses its mandate well is worth holding. One parked in large caps year after year is a different product from the one its label advertises, whatever its manager's skill. Which kind do you own?

So, what should you do?

No one can make a manager take more risk than they choose to. So the more useful question is not "what should I do?" but "what kind of a flexi-cap investor am I?". Three kinds sit in the category today and the evidence lays out different paths for each.

The cautious provider is a moderate risk-taking investor who cannot sit through a long fall, yet

Assumes a monthly SIP of ₹10,000 made at the start of each month in the average regular flexi-cap fund and the two indices.

needs equity to reach their goals. The average flexi-cap, with around 60 per cent in large caps, already matches that profile. This investor need not go looking elsewhere; their needs are well served where they are. They need only to moderate their expectations, for the alpha the label once promised is long gone.

The wealth builder came for that alpha and will ride out volatility for higher returns. For them, the drift to safety is a broken promise. They need guaranteed mid- and small-

cap exposure, not a nervous manager's discretion. A multi-cap fund offers the most reach; a large and mid-cap fund, a little less risk.

The conviction investor finds even half their money in large caps too timid, has no near-term claim on the money, and can sit through lean years without flinching. They should build and rebalance their own mix of large-, mid- and small-cap funds. It carries the highest risk, demands the most in knowledge and discipline, and over a long enough life can pay the most.

Whichever investor you are, remember where the real danger in equity lies. Not the steep drawdown, frightening as that feels. It is the restless switching that has cost investors more than any crash. The fading flexibility of flexi caps deserves attention, but first decide which of the three investor types you are. If a change is warranted, be gentle with your portfolio. Send fresh money to the fund that fits you first, then move your corpus slowly, watching for tax and exit loads. ☒

Which flexi-cap investor are you?

We cannot make a fund manager take more risk but we can match the fund to the kind of investor you are. Find the face that fits, and you have your answer.

	MODERATE RISK Keep your flexi cap	HIGH RISK Multi-cap or large & mid-cap	VERY HIGH RISK Build it yourself
			
	Sunita, 47 THE CAUTIOUS PROVIDER Has two children in college and a home loan in its final years.	Arjun, 35 THE WEALTH BUILDER Settled in his career, with decades of earning still ahead.	Kabir, 27 THE CONVICTION INVESTOR No dependents, watches the market daily.
Risk			
Age	40-50	30-40	20-35
Responsibilities	Heavy ; dependents & near-term goals	Light to moderate; few dependents	Few or none
Horizon	Long , with claims on the money along the way	10 years or more	Well beyond 20 years
Income	Stable , but committed	Stable and growing ; keeps investing through falls	Stable and growing ; increases investments during falls
Appetite	Moderate ; cannot endure a prolonged fall	High ; came for the upside, can ride out falls	Very high ; can sit through 8-10 lean years
Knowledge	Working, not expert	Good and growing	High; happy to manage and rebalance
What to do	Stay invested in flexi caps. Just lower your hopes of sustained alpha over the long run.	Move to a multi-cap or large and mid-cap fund, where the mid and small allocation is guaranteed.	Own separate large, mid and small cap funds in your own mix, and rebalance them once a year.

[INTERVIEW]

MANISH GUNWANI

Chief Investment Officer - Equity, Bandhan AMC

Why Bandhan Small Cap is okay with liquidity risk

For Bandhan CIO, liquidity risk demands a higher standard of conviction

Thirty years in markets teaches you something that no framework can fully capture: when to act and when to wait. Manish Gunwani, CIO - Equity at Bandhan AMC, has built his

reputation on exactly that kind of patience and conviction. Managing over ₹57,000 crore across seven funds, he runs one of the country's highest alpha-generating small-cap strategies while staying grounded in a simple but demanding idea—only buy what has a genuine chance of doubling in three to four years.

In this conversation, he shares his thinking on IT services, the flexi-cap dilemma, the value versus growth debate and where the next big rerating opportunity lies.

Your small-cap fund has generated the highest alpha in the country, not just within the category but across active diversified equity funds. What's driving that?

First, a disclaimer. The current team has been together for only about three years, which may not be long enough to draw definitive conclusions. That said, it's always good to get

off to a strong start. I still see this as the beginning.

A few things have probably helped. The first is risk management. Small-cap investing comes with liquidity risk, which we've tried to address through a highly granular portfolio. We hold more than 200 stocks. Second, every portfolio carries macro risk. We've tried to minimise that by maintaining exposure across industries and segments rather than concentrating heavily in financials, capital goods or any single theme. If you look at our portfolios over the last three years, we don't go heavily cyclical or very defensive. We are present in most sectors in a reasonable proportion.

The third risk is business fragility. Small-cap companies tend to be more vulnerable than large caps. They may have client concentration, key-person dependence or other operational risks. Diversification helps us manage those risks as well.

Beyond risk management, the heart of the fund is research. We have a relatively large team and a broad coverage universe. We track more than 700 companies. Very few AMCs cover that many stocks. It's about the DNA of focusing on small caps.

One aspect that's particularly important is how we evaluate our research team. Most AMCs use model portfolios to measure analyst performance. That works reasonably

well for large caps and mid caps, but it has limitations in small caps. In a model portfolio, the smaller companies often carry very low weights. As a result, analysts naturally focus more on the larger positions. We've tried to solve that by creating a separate process that specifically measures small-cap research performance. It may sound like a small change, but many such changes add up. Over time, they help build a culture where analysts are genuinely hunting for the next multibagger. That's really what small-cap investing is about.

You can't reduce that entirely to a process document. It's a combination of systems, incentives, performance measurement and day-to-day interactions. Our effort has been to build an ecosystem where there is genuine enthusiasm for finding opportunities in the small-cap space.

The broader market has been fairly flat for a couple of years. Yet you've consistently held 10-13 per cent cash in the small-cap fund. Is that a house view or a fund manager call, and why maintain such a high cash level?

Even before recent market conditions, our normal cash level was around 5-7 per cent. One reason is that investors often forget that redemptions can happen at market bottoms. We've become accustomed to a world where inflows are constant, but history tells us that's not always the case. In a relatively illiquid category like small caps, I believe it's prudent to maintain some cash simply to manage redemption risk. Unless we're facing an extraordinary opportunity like the Covid crash or the Lehman crisis, having 7-8 per cent cash doesn't bother us.

If you look at our history, cash peaked at around 15-16 per cent.

Ratings data and portfolio split data based on asset-weighted disclosures as of April 30, 2026. Sectoral allocation represents the average of diversified, active, equity-dominant funds.

Today it's closer to 10-11 per cent. In reality, that's only about 3-4 percentage points above our normal level. The decision is loosely linked to the framework we use in our balanced advantage model, which currently sits at around 55 per cent equity. That's in the middle of the 30-80 per cent range and suggests that markets are neither exceptionally cheap nor exceptionally expensive.

In a small-cap fund, a 3 per cent difference in cash allocation doesn't really determine performance. So we're operating with cash levels that are only slightly above normal, which is fine.

But doesn't holding 10 per cent cash drag on returns?

We also don't use too much of mid and large caps. In that sense, we are a slightly higher-beta portfolio. If you have a slightly higher beta, being 90 per cent invested really doesn't

matter that much.

It's not like I am 65-66 per cent small-cap and 25 per cent large and mid cap, which would lower the beta. We have a reasonably high level of small-cap exposure and, even within small caps, a reasonable amount of micro caps. When you own ₹2,000 or ₹7,000 crore market-cap companies, they tend to have even higher beta than the average small-cap stock, which may be a ₹10,000-12,000 crore company.

So we are okay taking liquidity risk and maintaining a slightly higher cash level because the whole thesis behind this product is very simple.

I like to say this repeatedly: whenever we deploy money in the small-cap fund, we want to invest with an absolute-return mindset. We want to buy stocks that have a high probability of doubling over three to four years. If we don't see that kind of opportunity, we're comfortable holding 10-12 per cent cash instead of 8 per cent. The reason we focus on a three- to four-year doubling is that it translates into roughly 18-24 per cent CAGR returns. Obviously, not every stock will achieve that. Some may double, some may do less and some may not work at all. But if enough of them succeed, the blended portfolio can still generate high-teen returns.

Our broader view is that, from current valuations, large-cap, mid-cap and small-cap indices are likely to deliver something close to nominal GDP growth, around 10-11 per cent annually over five years. So any product that can potentially generate high-teen returns is a very attractive asset class. If our hit rate is higher, returns may be higher. But we prefer to maintain the discipline of investing only when we see compelling opportunities. If those opportunities are not

[INTERVIEW]

available, we are comfortable carrying a bit more cash. When you're taking liquidity risk, there should be a high bar for investment.

Your funds consistently show one of the lowest portfolio PEs in the category. Is that deliberate? And how does your broader investment philosophy translate into stock selection?

Not really. Value is not something we explicitly target. I'm not guaranteeing that our portfolio PE will always be lower than the index PE. It's not by design. That said, if you go back to the absolute-return mindset, there are many FMCG stocks and capital-goods stocks that may grow earnings at 8-12 per cent but trade at 40-50 times earnings. We've never been particularly excited by that. We believe that if you cover a large number of companies and have a good, experienced team focused on small caps, you'll find opportunities where you don't need to pay such high valuations. At the same time, I should clarify that we've owned loss-making internet platforms. We've owned capital-goods companies with very high growth rates where we felt higher PE multiples were justified.

It is also somewhat cyclical. Today, many growth stocks are expensive and macro risks are elevated. Take autos, for example. It's a difficult sector right now because there are technology risks, model risks and macro risks. Demand could slow given higher energy prices, inflation and the possibility of interest-rate increases. Global auto companies also trade at relatively low valuation multiples. In that environment, paying very high multiples for growth becomes difficult.

It's not that we refuse to pay high PE multiples. But then the growth has to be very strong. The return on

equity has to be high. The unit economics have to be attractive. There must be some structural advantage such as a network effect.

So it's not accurate to say we never own high-PE stocks. We do.

But we don't like paying high valuations simply because a company is considered high quality. We're not running a "buy quality at any price" strategy.

Value can come from growth, contrarian opportunities or thematic opportunities. But paying 40-50 times earnings without strong growth is something we find difficult to justify.

Value has outperformed for three to five years now. Do you think that continues, or are we heading into a growth-led phase?

I think the first three years after Covid were clearly dominated by value. The last two years have been more mixed. Power-equipment stocks have done well despite trading at 60-70 times earnings. Some metal stocks, which are more value-oriented, have done well. PSU banks have done well. At the same time, some consumer and internet stocks have also performed well.

So I would say the period from the Covid bottom in 2020 to around 2023 was a much more extreme value phase. Commodities and PSU banks did spectacularly well. When I look at the macro picture today, the biggest trend is AI.

India has, in some ways, been disadvantaged because we don't really have a meaningful AI ecosystem. Markets such as the US, Korea and Taiwan have benefited significantly from it. AI has also pulled up parts of the commodity complex, including copper and aluminium, which has helped markets like Brazil and South Africa.

I do think growth will come back at some point. For that to happen, we need foreign investors to return. Right now, when the S&P is delivering earnings growth of around 20 per cent and some markets are growing much faster, there isn't a compelling reason for global investors to allocate aggressively to India, where earnings growth is closer to 13-15 per cent.

Of course, those global growth rates are unlikely to be sustainable. Many of those AI-related and memory-related stocks look quite frothy. At some point, global liquidity will come back to India. Historically, foreign investors tend to prefer growth and quality-oriented businesses. So yes, I think growth will come back into favour eventually. In the meantime, this is a good period to accumulate some of the sectors that foreign investors previously loved: private banks,

insurance and certain consumer discretionary names. If you look at our small-cap fund, you'll notice that we've gradually increased exposure to some of these sectors because valuations have become much more reasonable.

The Small Cap Fund has generated strong alpha,

but the Flexi Cap Fund hasn't stood out in the same way. What's holding it back, and what needs to change?

We revamped the Flexi Cap Fund around two years ago. While it hasn't stood out, it's actually not very far from where we intended it to be.

When we manage multiple funds, each fund is designed with a specific role in mind. Internally, we use what we call a "fund casing" framework, which effectively acts as a risk

it's designed to generate steady alpha over time, perhaps in the range of 2-4 per cent above the benchmark.

One additional issue in the 2026 calendar year is our market cap model. We built a model for the Flexi Cap Fund to guide how much small- and mid-cap exposure to carry. That model can swing from 50 per cent small and mid cap at one extreme to largely large cap at the other. The model still hasn't called for increasing small- and mid-cap

probably more important.

The first relates to risk management. Today, a fund manager's primary responsibility is to beat the benchmark. Whenever you deviate significantly from the benchmark, you are taking a risk. If your benchmark is something like the Nifty 500, which is roughly 65 per cent large cap, it becomes difficult to justify having only 20 or 30 per cent large-cap exposure. For large fund-management organisations, a 20-30 percentage point deviation from the benchmark can be difficult to sustain.

The second reason is more behavioural. The largest flexi-cap funds today manage ₹50,000 crore or even ₹1 lakh crore. At that scale, it becomes very difficult to move meaningfully into mid and small caps. Now think about the position of a smaller AMC. A smaller AMC attracts money in two ways: by beating the benchmark and by beating the large incumbent funds in the category. If I'm running a ₹1,000 crore flexi-cap fund and I can't outperform a ₹70,000 crore flexi-cap fund, it's very difficult to attract assets. So, in one sense, the benchmark for a smaller fund isn't just the index. It's also the largest funds in the category. Once the biggest funds are running with 70-75 per cent large-cap exposure, it becomes behaviourally difficult for everyone else to take a radically different position. If I reduce large-cap exposure to 30 per cent and a year like 2025 happens. The large funds outperform me by 5 per cent. Then my career is effectively done. It's not just about benchmark risk. It's also about competing with the largest funds in the category. If your call goes wrong, it becomes very difficult to attract money in the future. ☑

Since multiple categories exist today, fund houses often try to differentiate their products. Having a multi-cap fund means there is some incentive to make the flexi-cap fund look different.

budget for each strategy.

The Small Cap Fund is run with an absolute-return mindset and is designed to pursue deeper-value opportunities. The Flexi Cap Fund is more benchmark-oriented than some of our other funds, such as the Value Fund, Large and Mid Cap Fund or Focused Fund, where active positions and sector deviations tend to be larger. Our objective for the Flexi Cap Fund is consistency. If we can remain in the second quartile most years and move into the first quartile on a five-year basis, we believe that will create a strong long-term outcome. Over the last two years, we've largely been a second-quartile fund. Ideally, we'd like to see some first-quartile years as well, but we're not very far from the outcome we intended.

The fund was never designed to generate 10-15 per cent alpha over short periods. Its structure and risk controls make that unlikely. Instead,

exposure, even though small and mid caps have actually outperformed in what's been a pretty challenging macro year. That's been a bit of a surprise. It's left us more large-cap-oriented than peers in the category, which has been a relative headwind in 2026.

Most flexi-cap funds maintain a heavy large-cap bias regardless of market conditions. This trend has become even more visible after the introduction of the multi-cap funds category.

Why is that so?

I think there are two or three reasons.

One is what you mentioned. Since multiple categories exist today, fund houses often try to differentiate their products. Having a multi-cap fund means there is some incentive to make the flexi-cap fund look different. But there are two other reasons that are

‘This decade may belong to mid-tier private banks’

HSBC MF's fund manager on mid caps, banks and a bruised market

For Cheenu Gupta, a good portfolio is one that reflects the environment it operates in, not the one a fund manager wishes it were. As Fund Manager – Equities at HSBC Mutual Fund, Gupta brings nearly two decades of experience across some of India's most respected asset managers, including Canara Robeco, Tata AIA Life Insurance and ING Investment Management. A CFA charterholder, she has built her investment philosophy around three clear portfolio buckets—stability, growth and turnaround—and is not afraid to act when conditions shift.

In this conversation, she shares her views on small-cap opportunities, mid-tier private banks, the case for commodities and where fresh money should go today.

Markets have corrected from recent highs. Concerns around stretched valuations were widespread in 2024, though the correction has been more gradual than sharp. Where do valuations stand today? Have they normalised, and is that normalisation uniform, or are there pockets that still look expensive or attractive?

It's important to understand the context of where we are coming from. Even prior to the war, we had already seen around 18 to 20

months of a very sharp correction. That itself had brought the markets to a point where we sensed a bottoming out. And obviously, this was on the back of some earnings consolidation and market corrections we had seen.

Before we could really enter a phase of earnings recovery, the war came in, and that is when the markets hit an absolute low last month. The war is still going on, but when it first started, I think markets corrected by almost 14–15 per cent year-to-date, which was a very sharp correction. Part of it is justified by the high crude levels that we have seen. But I think the broader theme is that, from a medium- to longer-term perspective, valuations have started looking a bit more attractive than what we have seen in Indian markets in recent years. Hence, we believe that if retail investors are entering with a medium- to long-term perspective, it is a good thing. Only in the near term, if you are expecting a sharp recovery, it could be delayed

progresses and where crude prices stabilise. So, the near term is still a little uncertain and volatile, but from a medium- to longer-term perspective, markets are well positioned.

Your Large & Midcap fund has about 14 per cent in small caps, roughly 5.5 to 6 per cent above the category average, while large-cap allocation appears underweight. Does this reflect stronger conviction in small caps, and is the positioning too aggressive for the category?

I think the way to look at it is through the allocation to small caps in the Large & Mid Cap fund. We know how the category is defined, and there is a minimum 35 per cent allocation to large caps and a minimum 35 per cent allocation to mid caps. That takes away 70 per cent, and out of the remaining 30 per cent, you have the flexibility to invest across large, mid, or small caps,.

Of this 30 per cent, we have chosen to allocate around 15 per cent to small caps as of April 30, 2026. This is more of a decision based on the environment. Small caps, by nature, are cyclical and very sensitive to the broader environment. As we discussed earlier, there has been a good correction in the overall small-cap space over the last 18 to 24 months. Based on this, we are finding pockets within small caps. Valuations have become reasonable. As I mentioned before, the environment remains uncertain, so one has to be very selective when taking calls in this segment.

It is not a space where all small

Ratings data and portfolio split data based on asset-weighted disclosures as of April 30, 2026. Sectoral allocation represents the average of diversified, active, equity-dominant funds.

caps will do well. But if you are selective, I think there are a reasonable number of opportunities available at reasonable valuations. So allocation in this fund is more cyclical, or you can say opportunistic in nature, when it comes to small caps. There have been times when our small-cap allocation in the fund was closer to 9-10 per cent. So we have been tactical in using this allocation flexibility in the Large & Mid Cap fund.

Talking about the large- and mid-cap allocation, yes, large caps aims to offer stability, and valuations in that space seems reasonably attractive. But one thing to understand is that earnings growth in large caps has structurally declined from what we were used to. Earlier, we saw high-teens earnings growth in large

caps; now that has shifted to low teens, and that is unlikely to change in a hurry. Based on that, mid caps look relatively more lucrative, as their business models have become much more robust than they used to be. Mid caps today are in a position similar to that of large caps a decade ago. They aim to deliver high-teens earnings growth with business models that are much stronger than before.

Hence, our preference towards mid caps has also remained strong. So yes, we are opportunistic in taking small-cap allocations within the fund, while large caps remain reasonably attractive, which is why we still maintain an allocation of around 40-45 per cent to large caps.

How would you describe your stock-picking style? Does it lean more towards growth, value or a blend of both, and how has it evolved over time?

I think over time, style matures and settles, and the same thing has happened with me. The way I now look at portfolio construction and stock picking within those portfolios is through three buckets.

The first bucket in the portfolio is dedicated to stability. So about 20 per cent of the portfolio allocation is primarily determined by which stocks can potentially provide stability to the portfolio. The next 50 per cent, which is a sizable proportion of the portfolio, is oriented towards growth. These are companies that are growing faster than their peers or the industry as a whole. Here, I think these companies enjoy a moat. And if you understand moats, by definition, they are not permanent

INTERVIEW

in nature. There is a certain period during which these moats come into being, for whatever reason. It could be because the company has undergone a business model change, experienced regulatory changes or made product-related changes that have strengthened these moats.

During this period, I think these companies enjoy relatively faster growth. The idea is to identify companies with higher earnings visibility, greater earnings durability and the potential to scale during this phase. So around 50 per cent of the portfolio is dedicated to companies selected through this lens.

Now comes the last 30 per cent. This part of the portfolio is primarily for companies in a turnaround phase. And turnarounds can happen for various reasons. Let me cite a few examples. It could be due to the cyclical nature of an industry. Many industries we see, from hospitality and travel to hospital segments, exhibit a degree of seasonality or cyclicity. Companies in the commercial vehicle space are another example. Many times, when the cycle is turning, valuations in these categories can become attractive. This is the stage where we would want to allocate capital to them.

Sometimes, regulatory changes in an industry can suddenly put sectors into a turnaround phase. We have seen examples like safeguard duties being imposed on the steel sector. These are situations in which industries that earlier did not enjoy much appeal suddenly become more compelling. This is also the phase where they often move into the value zone.

Thus, around 30 per cent of the allocation goes to ideas undergoing a turnaround. Overall, if I look at the portfolio construct, around two-thirds of the allocation is towards growth and, while one-third is towards ideas where we see opportunities for potential long term alpha generation.

Your Mid Cap Fund's allocation to financials has grown from around 18 per cent a couple of years ago to nearly one-third today. What drives your conviction here, and what specific pockets within this broad sector excite you the most?

Let's start with the lending space. I think lending in India has behaved reasonably well over the last three to four years. In fact, post-Covid, this sector has matured to a different level. Looking at asset quality, we have not seen this level of health for a very long time. Every time concerns emerge, whether around SME asset quality turning adverse, retail stress building up or issues around small-ticket personal loans, those fears have largely been addressed over time. I think the worst-hit sub-segment over the last few years was microfinance, and even

today, as we are talking, that pocket is gradually recovering, and asset quality there is improving.

Overall, for the industry, asset quality has performed well. Loan growth also remains healthy. I think technology has played a big role in improving lending penetration, benefiting both banks and so, we continue to find the lending space reasonably attractive. Additionally, if you look specifically at the mid-cap segment, there is one interesting trend playing out, and one call we have taken more broadly as a house. We believe that, in this decade, large private-sector banks may not gain market share as they did in the previous decade. Over the last decade, we all saw them gaining market share from PSU banks. But this decade, we believe the category poised to gain market share is mid-tier private-sector banks.

These are banks with balance sheets ranging from ₹2 lakh crore to ₹5 lakh crore—reasonably scaled institutions—and technology is giving them the ability to bridge the gap with larger banks much faster. So they appear quite attractive, and hence we remain fairly bullish on mid-tier private banks. From the NBFC perspective, we are more selective and focus only on businesses where we believe there is strength in the underlying business model.

Apart from lending, as you mentioned, there are several other spaces as well. The non-lending segment is also picking up in a meaningful way. The number of companies joining this ecosystem seems to grow by the day.

Capital market-related businesses, for example, have seen strong growth. Exchanges

have done well, and we remain positive on them because we believe the regulator is doing a good job of maintaining discipline in the space while allowing the ecosystem to mature. Hence, it becomes an ideal combination: you have growth, but also regulatory oversight. A rapidly growing space without regulatory checks can sometimes create issues. We think this combination is working well. Even in asset management companies, a year ago, you had only a handful of names to choose from. Today, you have a much broader basket of AMCs available, which gives investors more choices..

banks within the lending space, as these are the pockets we currently find more attractive.

For investors looking to deploy lumpsum money today, where do you see the strongest opportunity across equities, fixed income and commodities like gold and silver? Which asset class gives you the highest conviction right now, and why?

Let's start with fixed income. What we are saying there is that the rate cycle itself is turning. We are coming out of a phase where rate cuts were happening, a period

given the geopolitical environment, and there is also structural support for these commodities, driven by factors such as central bank buying. However, these asset classes have already delivered very strong returns over the last one to one-and-a-half years. Typically, whenever an asset class delivers such outsized returns, it goes through a phase of consolidation. I think we may be entering such a period now.

The idea here is to stay invested or gradually accumulate in this category if you do not already have the desired allocation. But I do not see these categories running away sharply in the near term.

The third bucket is equities. We believe equities are coming out of a very troubled period, and by that very definition, the upside potential here can be meaningful because you are starting from a relatively low base.

I would still maintain that near-term visibility for equities is not particularly strong, especially given that crude remains at current levels. As we speak, crude is above \$120 per barrel, and these are tricky conditions. If prices remain elevated for a prolonged period, you could see earnings downgrades across several sectors, though there will also be some sectors where earnings improve. From a fund manager's perspective, taking those calls and reflecting them appropriately in the portfolio becomes important to safeguard earnings. So if you look beyond near-term volatility driven by higher commodity and crude prices, I think medium- to long-term starting points for equities appear quite interesting. That is how I would look at it. 

Gold and silver have become a very important part of an investor's portfolio today. Some degree of diversification into these assets is required, especially given the geopolitical environment.

Similarly, insurance also remains attractive in its own way. Valuations are under control, and you can still see reasonable growth opportunities. There are various pockets available, and we have made our choices accordingly. Obviously, we also take tactical calls. For instance, we believe the rate cycle is turning right now. We could be moving from a phase of rate cuts towards a cycle where rates start rising again. As a result, we have reduced our allocation to NBFCs and trimmed our exposure to life insurance.

On the other hand, we have increased our allocation towards capital market businesses and

during which fixed income looked relatively more attractive because you also had the benefit of capital gains. Soon, we could be entering a phase where rates start moving higher; not immediately, but sometime later. This is typically not a very favourable environment for fixed income. Yes, accrual returns can still occur in that category, but the scope for capital gains may not be there.

The next bucket is gold and silver, the commodity segment that you spoke about. I believe these have become a very important part of an investor's portfolio today. Some degree of diversification into these assets is required, especially

Green under siege

War and volatility are now nibbling at multi-year gains

Data as of June 12, 2026 for BSE indices. Total Return Index (TRI) considered for all indices. Returns of over a year have been annualised.

Nifty Commodities index

Why today's headlines do not match yesterday's truth

Index snapshot

About the Index

Tracks 30 commodity-linked companies listed on the NSE. Constituent weights are based on free-float market capitalisation, with each stock capped at 10 per cent at the time of rebalancing.

Launch date

Sep 7, 2011

Number of constituents
34*

Median market capitalisation

₹1.3 lakh cr

Largest/Smallest constituent (Market cap, in ₹)

Reliance (17.5 lakh cr)/PI Industries (41,445 cr)

Market-cap data is as of June 4, 2026. *Index generally comprises 30 stocks, but had 34 constituents as of May 29, 2026, following the demerger of one of its constituents.

Industry breakdown

Though thematic in nature, the index draws its constituents from a range of industries

The index has meaningful PSU exposure, with nine public sector companies accounting for close to 29 per cent of its weight.

Data as of April 30, 2026. Industry classification as per Value Research.

Outpacing the broader market recently

Nifty Commodities has beaten Nifty 500 over short and medium term, with the past year standing out

Trailing returns as of June 4, 2026.

Recent gains mask lag

Five-year rolling returns show Nifty Commodities lagging the Nifty 500 for most of the time

Data is based on five-year rolling returns calculated on a monthly basis.

Final verdict

The past year flatters this index. Commodities surged while the Nifty 500 slipped, and the trailing numbers now read well. But the long-term record tells a different story. Across rolling five-year windows since 2011, the Nifty Commodities beat the broad market only 27.6 per cent of the time. It returned 8.3 per cent p.a. on

average against the Nifty 500's 11.4 per cent, and turned negative 17.8 per cent of the time against just 1.6 per cent for the broad market.

A strong rally now sits on years of lagging returns and deeper losses. For long-term wealth creation, the broad market remains the steadier choice for most investors.

Nifty Pharma: A healthy addition to your portfolio?

A look at the index's mixed record before you invest

When the broader market is under the weather, the Nifty Pharma index tends to be healthier. Take the last one year (as of June 1, 2026), during which the Nifty 500 TRI gave a paltry -0.7 per cent while the Nifty Pharma TRI was up nearly 14 per cent. Part of the reason is defensive demand: people may postpone buying a new phone or taking a foreign trip, but not their medicines. But the bigger reason boosting the sector is the weakening rupee. The last one-year outperformance coincides with the rupee depreciating by roughly 10 per cent against the US dollar.

Why weak rupee is good news

A weak rupee is a shot in the arm for India's pharma industry, where most heavyweights collect the bulk

of revenue from outside India. If a firm books most of its sales in US dollars and the dollar strengthens, those same dollars convert into more rupees, and reported income gets a lift. The reverse is true for businesses that import most of their raw materials, since their bills go up. For the export-heavy pharma pack, currency weakness usually lands on the right side of the ledger and lifts returns as well. This has held over its long history in the market.

The currency lift in the past

In four out of five periods, when the dollar sharply appreciated against the rupee during the past 20 years, the pharma index decisively outperformed the Nifty 500. See chart: A dose of dollar strength.

The long stretch from July 2011

The export engine

Overseas markets contribute the bulk of revenue for Nifty Pharma's largest constituents

Company	Index weight (%)	Overseas revenue share (%)
Sun Pharmaceutical	21.4	67
Divi's Laboratories	9.4	89
Dr. Reddy's Laboratories	8.9	89
Cipla	8.9	52
Lupin	6.2	66

Index weights as of May 29, 2026. Overseas revenue data for FY26; it represents the share of total revenue derived from international markets.

to September 2013 stands out when the dollar climbed nearly 44 per cent against the rupee. The

The index make-up

Nifty Pharma is built from 20 pharmaceutical stocks picked from the Nifty 500 universe. Each stock's weight is set by its free-float market capitalisation. So, the bigger the company, the bigger its slice. A single stock's weight, however, is capped at 33 per cent. A top-heavy index with the top five names making up close to 55 per cent and the top 10 about 78 per cent of weightage.

A dose of dollar strength

When dollar strengthened, Nifty Pharma mostly beat the broader market

Nifty 500 limped to a -0.8 per cent over that period, while the pharma index delivered a striking 46 per cent. The other phases were comparatively less dramatic but told a similar story.

A sharp fall in the rupee, thus, tends to flatter pharma's books for a few quarters and burnish its defensive reputation at the same time, a neat combination. But no health check is complete on short-term vitals alone. Let's look at the long-term record.

The long-term diagnosis

Of all five-year rolling periods over the last 15 years, the pharma index has beaten the Nifty 500 in 46 per cent of them. The Nifty 500 came out on top the other 54 per cent of the time. There's not a dominant one-way winner of the two over long periods. The broader market, though, has mostly remained ahead. See chart: Brilliant runs and brutal stretches.

The pharma index still has given 13.1 per cent annually on average when held for five years, slightly ahead of the Nifty 500's 12.7 per cent.

How can an index that outperforms less often still deliver a higher average return? The answer is in where most of its returns lie.

The pharma index has a habit of going to extremes. It gave 20 per cent-plus returns far more often than the Nifty 500 did. The broad index, meanwhile, has clustered in the 10 to 15 per cent return range, roughly twice as often as pharma. The pharma index also gave losses more frequently in 9 per cent of periods against just 1 per cent for the Nifty 500. See chart: A wider range of outcomes.

In short, the pharma index's returns show up at both ends with far more chances of both losses and sharp gains than the broader market. That is the signature of higher volatility, and the standard deviation confirms it: 9.2 per cent for the pharma index versus 5.3 per cent for the Nifty 500 on average over five-year rolling periods.

Prescription for investors

When rupee weakens against the

A wider range of outcomes

Pharma index sits at both ends of the return band far more often than Nifty 500

Return range (p.a.)	Freq. of return (% of time)	
	Nifty 500	Pharma
Less than 0%	1.1	9.2
0 to 5%	9.2	9.2
5 to 10%	18.4	18.9
10 to 15%	35.7	17.8
15 to 20%	29.2	22.2
Greater than 20%	6.5	22.7

Based on five-year rolling returns between January 2011 and May 2026. Returns are calculated using the Total Return Index (TRI) versions of both indices.

dollar, pharma companies tend to benefit as overseas earnings translate into more rupees. Combined with the sector's defensive appeal, this can fuel strong runs, much like the one we are seeing now.

But our data makes the limits of this trade clear. The pharma index has gone through prolonged periods of underperformance and has, in fact, lagged the broad market more often than it has beaten it. Its higher average return came not from steady outperformance but from occasional sharp bursts, paired with losses that the Nifty 500 almost never delivered. Entry timing, therefore, matters enormously, and predicting currency moves consistently is easier said than done.

Sectoral indices are best treated as satellite holdings rather than the foundation of a portfolio. The core is better served by a diversified index or fund that does not depend on one sector staying in favour or one currency moving in the right direction. ☒

Brilliant runs and brutal stretches

Pharma saw long periods of both outperformance and underperformance

Based on five-year rolling returns between January 2011 and May 2026. Returns are calculated using the Total Return Index (TRI) versions of both indices.

Data as of May 31, 2026; portfolio-related data as of April 30, 2026. The scoreboard features the top 150 ETFs by AUM, excluding debt ETFs. Performance figures are based on market price, not NAV. Premium/(discount) shows the average difference between the ETF's price and NAV over the past year. Tracking error reflects how closely the ETF has matched its benchmark returns. Liquidity is indicated by an icon next to AUM, based on average daily trading volume (ADTV): ☺ High – above ₹1 crore | ☹ Moderate – ₹10 lakh to ₹1 crore | ☹ Low – below ₹10 lakh.

Separating wheat from chaff

How filtration turns raw factor ideas into investment-grade portfolios

Factors offer a structured, rule-based way to navigate markets. They rank companies by measurable traits with decades of evidence tied to long-term returns. Quality favours strong fundamentals for stable compounding. Value favours companies priced below their worth, rewarding the patient and contrarian investor. Momentum favours recent winners for those at ease with higher churn and high short-term volatility. Low volatility favours smaller price swings for investors who prize capital preservation. Multifactor blends all four for diversified, cycle-resilient exposure.

The theory is sound and the academic

A raw factor portfolio ranks every stock on one single-factor score and selects the top names. The flaw is structural.

Aprajita Anushree/AI-generated Image

evidence deep. So why do raw factor portfolios still carry hidden risks in practice? The missing layer is not a better factor. It is better filtration.

The price of ignoring quality

Portfolios of fundamentally weak companies lag Nifty 500 with deeper drawdowns

Portfolio/ Index	Annualised return (%)	Sharpe ratio	Annualised volatility (%)	Maximum drawdown (%)
Negative ROE	8.56	0.19	24.25	-73.10
High Volatility	8.72	0.21	28.16	-78.35
High Debt to Equity	13.61	0.34	23.27	-68.27
High Promoter Pledge	8.80	0.19	22.76	-81.25
Nifty 500 TRI	15.01	0.46	17.08	-38.11

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJ AMC). Data for the period March 31, 2009 to March 31, 2026. The above portfolios represent stocks exhibiting weak characteristics on the respective parameters under consideration. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

The illusion of raw factors

A raw factor portfolio ranks every stock on one single-factor score and selects the top names. The flaw is structural. A score tells you where a stock ranks, not its quality, governance or risk.

A low price-to-book ratio can signal a bargain or a business the market has rightly abandoned. Reliance Communications looked cheap as debt rose and its business weakened. After failing to repay lenders, it entered bankruptcy in 2019, leaving shareholders with nothing.

Momentum has its own trap. Brightcom Group, an advertising-technology firm, surged

Filtered, but not diluted

Filtration cuts loss probability and drawdown without denting returns

Portfolio	Sharpe ratio	Annualised volatility (%)	Maximum drawdown (%)	1Y loss probability (%)	10Y median rolling return (% pa)
Raw Momentum	0.67	19.18	-63.56	18.73	24.11
Filtered Momentum	0.70	17.37	-58.93	15.80	24.15
Raw Value	0.48	20.23	-66.37	28.61	19.73
Filtered Value	0.52	18.52	-65.38	23.10	20.1

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJ AMC). Data for the period September 30, 2006 to March 31, 2026. Raw Momentum and Raw Value portfolio represent the top 100 stocks from Nifty 500 based on momentum parameters and NJ's Proprietary Business Specific Value Scoring Framework, respectively. Filtered Momentum portfolio and Filtered Value portfolio represent the top 100 stocks based on the same raw portfolio methodology, after filtering low-quality and high volatility stocks from Nifty 500. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

on a speculative rally in 2021, then lost more than 70 per cent once the regulator probed its accounts. Satyam Computers fooled both a low-volatility and a quality screen.

A ranking tells you the position, not the quality of what occupies it.

What gets in without a filter

Not every stock that passes a factor screen belongs in a portfolio. Three red flags stand out consistently.

The first is low return on equity (ROE). Companies in the bottom decile (bottom 10 per cent) of ROE often earn less than the cost of capital and tend to destroy it over time. The second is high debt-to-equity ratio. High leverage amplifies losses in downturns and can turn ordinary falls into permanent capital losses. The third is heavy promoter pledge, a red flag specific to Indian markets, which can invite forced selling even when the stock still scores well on a screen. Beyond these, interest coverage ratio, earnings consistency and auditor's independence also matter. The cost difference is measurable. Over the last 17 years, the Nifty 500 TRI returned about 15 per cent annually. Fundamentally weak companies' portfolio managed roughly 8 to 14 per cent and fell far harder, dropping 68 to 81 per cent from peak against the index's 38 per cent.

A filter is not a mere tweak. It is what turns a factor model from a ranking exercise into an investable portfolio.

How filtration works

Filtration works in two stages. First, screen the universe for financial health, removing names that fail minimum standards on ROE, leverage and promoter pledge. Then rank the survivors on the target factor. What remains is factor-attractive and fundamentally sound.

The gains are consistent across styles. Value avoids value traps. Momentum sidesteps speculative rallies. Quality gets rid of highly-levered companies. Multifactor avoids the worst of each.

Filtered momentum, for instance, reduces the one-year loss probability from 18.7 per cent to 15.8 per cent and annual volatility from 19.2 per cent to 17.4 per cent, while the 10-year median rolling return stays almost unchanged at 24 per cent. Filtered value shows a similar pattern: lower drawdown, lower loss probability, comparable long-run return.

The hidden benefit

The gain from filtration is not only in returns. Filtered portfolios fall less and swing less because the wealth-destroying tail of weak companies is removed. The improvement is asymmetric: most of the upside is preserved while much of the downside is shed. With regular rebalancing, the portfolio cleans itself, dropping a name as fundamentals weaken.

A filter is not optional

A filter is not a mere tweak. It is what turns a factor model from a ranking exercise into an investable portfolio. That is the point of our investment approach and philosophy: each model starts with a factor score and a slew of financial-health and quality filters are applied so that weak companies do not enter the portfolio.

India has more than 5,000 listed companies, but that abundance doesn't signal opportunity. In such a market, a robust factor framework must do more than just sort the attractive. It must first remove what should not be owned. ☒

SHYAMALI BASU

His, hers and theirs

Why couples need to plan finances together, not separately

I recently met a couple looking to begin their investment journey. Both were working professionals and had built investments before getting married. However, they were reluctant to discuss their investments jointly. They wanted to maintain financial privacy, and given the realities of modern relationships, I could understand their perspective. However, this arrangement comes with certain limitations.

I discussed some of these challenges with them and offered a few examples for consideration.

At the very least, household income and expenses should be known to both partners so that common financial goals can be planned

effectively. When we work with a couple as a unit, we can assign expenses clearly to avoid duplication and inefficiency.

I once met a couple who spent money on an ad hoc basis, with each partner paying for expenses as and when the need arose. Over time, this led to wasteful spending and overlapping expenses. One client of mine follows a simple arrangement: he pays the rent, while his spouse takes care of all other household expenses. This creates clarity, accountability and better control over the household budget.

A joint financial plan also allows us to assess asset allocation more effectively. Simply put, what is the risk-taking capacity of the household as a whole? Several factors influence this assessment: What are the couple's shared goals and timelines? Are both employed in high-paying but high-attrition industries? Do they have adequate term and health insurance? What are their combined liabilities?

These are important considerations when recommending investments. If spouses do not share the information required for planning, investment recommendations may be made without a complete understanding of their financial situation, which can ultimately work against their interests.

The issue becomes even more significant when it comes to investments. If spouses do not discuss their portfolios openly and choose different financial advisors, they may be unaware of overlaps in their investments. Are both

Household income and expenses should be known to both partners so that common financial goals can be planned effectively

Illustration: ANAND KUMAR

investing in the same sectors or themes? Is there meaningful diversification? Are there gaps in the overall portfolio? Will their investments help them achieve their shared goals within the desired timeframe?

There is also the possibility that both have neglected an important aspect of financial planning, such as building an emergency fund, perhaps because it appears less rewarding than investing. On the other hand, they may have allocated too much to safe assets, resulting in an overly conservative portfolio. These are considerations that become visible only when we evaluate the financial picture of the couple as a whole.

One couple I advised found a practical way to balance privacy with transparency. They maintained three accounts: his, hers and theirs. A fixed portion of each person's salary was retained for personal use, with complete freedom over how it was spent. The remaining amount was transferred to a joint account that funded household expenses and investments. I found this to be a sensible approach that

preserved individual privacy while addressing the shortcomings of completely separate financial lives.

Another couple followed a different model. One spouse managed the household spending, while the other handled investments for the family. At the same time, each retained a portion of income for personal interests, hobbies, travel or spontaneous purchases. Importantly, all major investment decisions were discussed together and aligned with their shared financial objectives.

Having encountered this issue repeatedly, I felt it was worth writing about. My intention is not to prescribe a single approach, but to highlight the challenges that can arise when couples maintain complete financial secrecy. Beyond that, I leave the matter to the judgement and circumstances of each couple. ☑

Value Research

For expert advice

SIFs explained

What are specialised investment funds (SIF)? Is it good for short-term investment?

- Ravikanth Sontha

Specialised investment funds, or SIFs, are a new SEBI-regulated category that sits between mutual funds and PMS/AIFs, meant for investors who want more advanced strategies such as long-short equity or debt. The minimum investment of ₹10 lakh tells you these are not meant for small or first-time investors.

SIFs offer more flexibility than regular mutual funds, but that means more complexity and higher risk. The category is also new, with no meaningful track record across market cycles.

Our stance is simple: wait and watch. For short-term needs, stick to safer, simpler fixed-income options.

NPS beyond 60

I am a 64-year-old single lady, and as of now, I do not have an NPS account. Would it be beneficial to start one now?

- Swati Mankad

Yes, you can open an NPS account at 64. Entry is allowed at a later age now, so eligibility is not the issue. The real question is whether it suits your needs.

At this stage, NPS will not help build a sizeable corpus. The investing window is too short and the equity allocation is capped for late joiners. Its only real draw is the deduction of up to ₹50,000 under Section 80CCD(1B), over and above the Section 80C limit. But that works only if you still have taxable income and file under the old regime. The new regime allows no such deduction on your own contribution.

Also remember that on exit, if your corpus exceeds ₹12 lakh, at least 20 per cent must go into an annuity, and that pension income is taxable. So treat NPS as a tax saving, not a pension. If neither condition applies, skip it.

SIFs are a new category that sits between MFs and PMS/AIFs. While they offer sophisticated strategies, they lack the track record to prove themselves yet.

Going direct

Can we use the Value Research platform to invest in direct plans, and how?

- Nikhil Bajoria

You can invest in direct plans through the Value Research Fund Advisor platform. The process is simple. Complete your registration and KYC first. Then, choose funds and start SIPs or make lumpsum investments in direct plans. Direct plans carry no distributor commission in the expense ratio, which helps reduce costs over time. However, investing directly means filtering a universe of over 1,700 funds and reviewing them periodically. That is where Value Research Fund Advisor helps, with a curated list of fund recommendations and detailed portfolio analysis. And because costs compound over the years, we recommend only direct plans. We charge a fixed fee and earn nothing from your transactions.

What risk appetite really means

What should be the investment philosophy in these turbulent times for a higher risk appetite individual?

- Anonymous

A higher risk appetite does not mean chasing whatever is rising. It means having the ability to stay invested through long periods of poor, flat or even negative returns without panicking.

If you genuinely have that temperament and a long investment horizon, you can continue investing in mid- and small-cap funds. These segments can reward patient investors, but they can also test patience severely when markets turn volatile. Even then, do not make the portfolio entirely aggressive. A meaningful allocation to large-cap funds is important because they bring stability and reduce the damage during market corrections. You can also use diversifiers such as hybrid funds or fixed-income investments, depending on your goals. So, stay invested, continue SIPs and avoid timing the market. High risk appetite should mean discipline, not overconfidence.

You can invest in direct plans of mutual funds through the Value Research Fund Advisor platform. Complete your registration and KYC first. Then, choose funds and start investing.

Investing without anxiety

How should a first-time investor build a long-term portfolio and stick with it for 10 years?

The biggest hurdle isn't market returns. It's your own discipline. The first plan is entirely about getting comfortable enough that you actually stay invested for 10 years.

If you're starting late, feeling scared or investing with some difficulty, begin a SIP in an aggressive hybrid fund. Do this for three years, then simply add a second aggressive hybrid fund. You're automatically getting an asset allocation of 75 per cent equity and 25 per cent fixed income.

Every time the market falls, the fund manager rebalances the portfolio for you, with no tax on that rebalancing. Every three years, add another fund, but stop at three. Adding more won't bring meaningful value. If you're young, confident about your income growth and not easily rattled by market swings, skip the hybrid route and start directly with a multi-cap fund. One good multi-cap fund to begin, a second after a year and a third after two or three years. Cap it there.

If picking active funds feels overwhelming, a simple combination works well: an index fund like a Nifty 50 or BSE 500 paired with an active multi-cap fund, with half your money in each. Every few years, add to the multi-cap side or increase your allocation to the index fund you already hold. You don't need a second index fund. It will just replicate the same index under a different name.

This gives you a low-maintenance, tax-efficient portfolio. Whatever the fund manager does behind the scenes, you don't

If you're feeling scared or investing with some difficulty, begin a SIP in an aggressive hybrid fund

In India, gold is woven into weddings, rituals and a sense of financial security that no public appeal is likely to unwind

pay a rupee in tax until you actually redeem your investments when you need the money.

Gold, habits and the rupee

Will high gold prices change Indian buying habits, and how should investors respond to a weaker rupee?

Price, income and habit are the usual drivers of what people buy. But gold in India runs deeper than any of those. It is woven into weddings, rituals and a sense of financial security that no public appeal is likely to unwind. People may nod at the sentiment, then forget it entirely when the next family wedding comes around. The one thing that acts as a real deterrent is price itself. At ₹1,53,000 for 10 grams, gold has become genuinely expensive for many buyers. Predicting where gold goes from here is difficult. Its value could move either way, particularly if global central banks face a liquidity squeeze and begin selling reserves. What the government's appeal really signals is a preparation of public opinion for possible policy steps—restrictions on overseas spending, disincentives on foreign travel or other measures to manage currency pressures.

When the rupee depreciates to these levels, the clearest portfolio response is to look at businesses that earn in foreign currency. The two obvious beneficiaries are IT services and pharma. Pharma is currently enjoying two tailwinds at once. IT is a more mixed picture. Currency depreciation works strongly in its favour. But the sector is also managing a structural challenge: the shift away from traditional man-hour billing toward outcome-based models, driven by the rise of AI.

A webinar series to discuss savings and investment issues and answer your questions

An Investor Education & Awareness Initiative by

[SCOREBOARD] Guide

Optimise your investments with clear and comprehensive mutual fund data

► Serial Number

A serial number is generated for every fund and is the first column on the Scoreboard. To locate a specific fund, look for this number in the Index against the name of the fund.

► Portfolio Composition

For equity funds, it shows the portfolio's allocation in large-, mid-, small-cap stocks and cash/others. **Value Research** follows its own market-cap classification to arrive at this. The top listed companies that constitute 70 per cent of the market cap are classified as 'large caps'. The ones that fall between 70-90 per cent of the total market cap are classified as 'mid caps'. The smallest listed companies that comprise the remaining 10 per cent of the market cap are called 'small caps'.

In the case of hybrid funds, the minimum and maximum allocations to equity and debt over the past 12 months are displayed. For funds launched within the last year, the available historical range is provided. The equity exposure is shown net of derivatives (unhedged portion).

Portfolio Composition (%)

Equity		Debt	
Min	Max	Min	Max

► Alpha

Indicates value added (or subtracted) by the fund vis-a-vis the benchmark, for the risk taken. A positive alpha indicates that the fund has performed better than expected, while a negative alpha indicates the fund has underperformed based on the risk taken by the fund manager. It is calculated using calendar month returns for the last three years.

S.No.	Fund Name	Performance								Portfolio Composition (%)					Info. Ratio	Risk Grade	Expense Ratio (%)	Assets (₹ cr)	Fund Rating	Average Rating
		Returns (%)				Rank				Large Cap	Mid Cap	Small Cap	Cash & Others	Alpha						
		1Y	3Y	5Y	10Y	1Y	3Y	5Y	10Y	Cap	Cap	Cap	Others							

Portfolio Composition

Credit Quality (%)			Avg. Maturity (years)	
High	Medium	Low		

► Credit Quality

Debt fund's portfolio exposure across three levels:

- **High**
Includes exposure to government securities and corporate bonds with the highest grade ratings such as AAA, AAA+, AAA-, A1, A1+, P1+, AA+ and cash.
- **Medium**
Includes exposure to bonds with medium grade ratings such as AA, AA-, A2+ and A2.
- **Low**
Includes portfolio exposure to bonds with lowest grade ratings such as A+, A, A-, A3, BBB+, BBB, BBB-, BB+ and below.

► Average Maturity

Weighted average maturity of all debt securities held by the fund.

► Information ratio

Indicates excess returns generated by a fund relative to the category benchmark and the consistency of that out-performance. A higher information ratio compared to other schemes with the same benchmark reflects better risk-adjusted performance. It is calculated using calendar month returns for the past three years.

► Risk Grade

Value Research Fund Risk Grade measures a fund's risk of loss, focusing only on downside volatility, unlike standard deviation and beta. It accounts for absolute losses and periods of underperformance compared to a risk-free investment. This reflects the risk of earning less than a guaranteed return, such as from a term deposit. Fund risk is calculated by comparing monthly/weekly returns to the risk-free return (State Bank's 45-180 days Term Deposit Rate) and measuring underperformance. Average underperformance is used to derive a risk score, which is rated against the category average. The risk score of a fund is then rated according to the following distribution:

High : Top 10%
Above Avg (+Avg) : Next 22.5%
Average : Middle 35%
Below Avg (-Avg) : Next 22.5%
Low : Bottom 10%

► Fund Rating

The **Value Research Fund Rating** is a convenient composite measure of returns and risk, based on a quantitative system without any subjective components. It provides a quick summary of a fund's historical performance relative to its peers, adjusted for risk. For equity and hybrid funds, the system combines three- and five-year performance periods, while debt funds' ratings are based on 18 months and 36 months of weekly risk-adjusted performance. Only equity funds with a minimum three-year performance history are rated, and for debt funds, the minimum is 18 months. A category must have at least 10 funds with an average AUM of at least ₹5 crore over the past six months to be rated. The rating distribution is as follows:

★★★★★ : Top 10% funds
 ★★★★★ : Next 22.5%
 ★★★ : Middle 35%
 ★★ : Next 22.5%
 ★ : Bottom 10%
 NR : Not Rated

► Average Rating

The average of the monthly fund ratings over the past three years. For newer funds, the available rating history is used.

Numbers are in ₹ lakh; - indicates that the fund lacks sufficient performance history; data as of May 31, 2026

Returns **lost** in translation

After every currency rout, history has rewarded the investors who stayed put

Currency depreciation adds to the pain

Nifty 50 trails Nasdaq 100, and a weaker rupee widens the gap even further

Foreign money keeps flowing out

Foreign investors have withdrawn more money than they invested in Indian equities since late 2024

Source: NSDL. *Data for latest quarter till Jun 5, 2026.

Future after the dollar surge

Past periods of rupee weakness were followed by milder currency moves and strong returns in Nifty

Time period	During period (%)		Next 5 years (% p.a.)	
	USD appreciation	Nifty 50	USD appreciation	Nifty 50
Apr '08 - Mar '09	27.9	-42.2	3.6	19.7
Jul '11 - Sep '13	18.2	2.9	2.5	15.7
Jan '18 - Oct '18	15.6	-2.4	2.5	14.8
Jan '22 - Mar '23*	8.9	-1.5	4.1	12.4

Analysis covers major periods of dollar appreciation since 2006. Returns are annualised for periods longer than one year and absolute otherwise. Subsequent returns are calculated from the end of each period. *The Mar'23 episode uses a three-year forward period due to lack of enough history.

**Rooted in strength,
Shaping tomorrow!**

Strength of **Large-cap** meets
the growth potential of **Mid-Caps**

Presenting

Nippon India Vision Large & Mid Cap Fund

Nippon India Vision Large & Mid Cap Fund uses a dual strategy, combining the strength of large-cap stocks with the growth potential of mid-caps. Large caps endeavor to provide relative stability & liquidity and mid caps can potentially generate relatively better return.

What the fund offers:

Dual Strategy:
Strength of **Large caps**,
growth potential of
mid-caps

Strategic Blend:
Industry leaders meet
emerging leaders.

Long-Term Vision:
Optimal mix of market
leaders.

The real price of patience

“

"Price is what you pay. Value is what you get."

— Warren Buffett

”

Consider the investor who started an SIP in a Value fund in March 2015. Over the next five years, Value was the worst-performing factor in Indian equities. Every other strategy looked better. The case for switching was loud, and most people would have switched. Then March 2020 arrived, and the five years that followed put Value at the top of the table. Same investor, same fund, going from the worst trade to the best by doing nothing in the middle.

That is the contract Value asks you to accept. And it is why almost every investor I have spoken to this year has, in one form or another, asked me the same question. They look at their portfolio, the markets, the fees they pay, and what they own, and they ask: Am I actually getting what I paid for?

It is the right question. It is the one the price tag never quite answers. We obsess over what something costs. We forget to ask what it is worth.

Buffett learned the above line from Benjamin Graham. Graham did not invent the idea in the 1930s. The instinct to pay less than what something is worth is as old as buying and selling. What Graham did was give it a set of rules and a name. He called it value investing, and it has not aged in 90 years.

The Indian data carries the claim. Over the last two decades, the Nifty 50 Value 50 has delivered one of the largest Value premium over the broader market of any major equity market over the period studied. The premium is real. It is also the most uncomfortable premium to collect because doing so means sitting through the kind of stretch our March 2015 investor endured.

This supplement makes the case honestly. The data is here. The cycle is here. The temperament test is here. Whether you read it as a verdict on Value or as a question about yourself depends on which half you find more useful.

What is the Value factor?

Most investment ideas have a discoverer. Value does not. The instinct to pay less than what something is worth is as old as buying and selling itself. Long before the stock market existed, people were looking for bargains in every kind of trade. Benjamin Graham, the teacher who shaped Warren Buffett, did not invent value investing in the 1930s. He gave it rules. The pattern was already there.

The definition is simple. A value strategy buys stocks trading for less than what the business is actually worth. The market gets prices wrong often enough, and for long enough, to give patient investors a chance. When fear or short-term worry pushes a stock below its real worth, a value investor steps in. When the market corrects, the gap between what you paid and what the business is worth closes. That gap is your return. It is a straightforward idea - but it is not the only way investors have tried to beat the market.

How value differs from growth

The other school starts from the opposite end. Growth investing pays a high price today, expecting the company to earn much more tomorrow; value investing pays a low price based on what the company already earns. Growth bets on what could happen. Value bets on what is already in the price.

Over long stretches, both have rewarded patient investors and are just different ways of pricing the future, not opposing philosophies, and each behaves differently across market cycles.

Two ways to measure value

There are two broad ways to decide

whether a stock is undervalued.

1. Multiples-based valuation compares the market price of a stock to one of its fundamental anchors: earnings, book value, operating profit, dividends. The ratios used most often are P/E (Price-to-Earnings), P/B (Price-to-Book), EV/EBIT (Enterprise Value to operating earnings) and Dividend Yield. Each captures a different facet of cheapness.

2. DCF-based valuation: Here, you estimate what the company will earn in the future, year by year, and bring those future earnings back to today's value. This method, known as the Discounted Cash Flows (DCF) approach, is more thorough but depends heavily on guesses about the future. If those guesses are wrong, the answer is wrong.

The first approach is faster, simpler and easier to apply to thousands of stocks at once. The second is more detailed but harder to repeat consistently. Rule-based value strategies generally use the first method, because it is easier to check and easier to apply at scale.

What each parameter actually captures

P/E (Price-to-Earnings) tells you how much you are paying for every rupee of profit the company makes. A lower P/E generally means the stock is cheaper. But P/E can mislead when profits are temporarily very high or very low.

P/B (Price-to-Book) tells you how much you are paying for every rupee of net

assets (net worth) the company owns. It works well for businesses with lots of physical assets, like factories and machinery. It works less well for businesses whose value sits in brands, software or intellectual property.

EV/EBIT is a way of comparing companies regardless of how much debt they carry or how much tax they pay. It is especially useful for capital-heavy industries due to the higher impact of depreciation. Thus, simple P/E ratios can be misleading here.

Dividend Yield is the dividend you receive divided by the stock price you

pay. A high yield can mean different things. Sometimes the stock is cheap. Sometimes the price has fallen because the business is struggling, and the dividend may not last. And sometimes the company simply has limited growth opportunities and prefers to share profits with shareholders rather than reinvest them. Dividend yield is a useful signal, but it has to be read with the rest of the company's story.

No single ratio tells the full story. Each looks at attractiveness from a different angle, and a good value strategy uses several together.

Why the Value factor matters

Every factor has a reason for existing. Quality rewards businesses that compound. Momentum rewards the market's slow reaction to news. Low Volatility rewards investors who would rather sleep peacefully than chase the leaderboard. Value rewards the discipline of not overpaying.

This is not a complicated idea. The price you pay is the single biggest input into the return you eventually earn. Pay too much, and even a great company can give you a poor return. Pay too little, and even an average company can give you a strong one. Value investing puts this idea at the centre of the decision. Before asking what the company will do next year, it asks what you are paying for it today.

The benefit of starting at a lower price is more than just upside. It is downside protection. A stock that is already cheap may have less room to fall when the market gets nervous. The high price has been worked out of it.

That is the original margin of safety the early value investors talked about, and it still holds.

Not the highest returning factor, but the most steady one.

The data tells an honest story. In the visual titled "Meaningful, but not the highest", you can see how Value has performed against the other major factors in Indian equities over the last two decades. Value's annualised return is meaningful and well ahead of the broader market. But it is not the highest among the factors. Momentum has done better on absolute returns. Multi-factor strategies have performed better on a risk-adjusted basis.

What Value brings is something the return numbers alone do not show. It moves differently from the others.

Meaningful, but not the highest

Annualised returns of major equity factors in India over the last two decades

Index	Nifty 500 Value 50	Nifty 500 Momentum 50	Nifty 500 Low Volatility 50	Nifty 500 Quality 50	Nifty 500 Multifactor MQVLv 50	Nifty 500

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Calculations are for the period April 01, 2005 to March 31, 2026. Past performance may or may not be sustained in future and is not an indication of future return. Total Return Index (TRI) used.

Persistent, not exciting

Value is not the factor that will top the leaderboard every year. It is the factor that quietly beats the broader market over full cycles, holds its ground when other factors stumble, and provides the most useful counterweight in a diversified portfolio. The case for Value is not that it is the most exciting strategy. The case is that it is one of the most useful.

The lowest correlation is the real prize

Correlation measures how closely two things move together. A correlation of 1 means they move in lockstep. A correlation of 0 means they move independently. A negative correlation means they move in opposite directions.

When you look at the correlation between Value and the other factors in Indian equities in the visual titled "Value walks its own road", the picture is striking. Value has the lowest correlation with every other factor in the set. With Quality, the correlation is slightly negative. With Low Volatility, it is also

negative. With Momentum and Multi-factor, it is low and positive.

This is unusual and useful. Most factors share some common ground. Quality and Low Volatility move together because high-quality companies tend to be less volatile. Multi-factor strategies combine the others and pick up their movements. But Value walks its own road. When Quality is struggling, Value may be doing well. When Momentum is in a sharp drawdown, Value may be holding steady. This is what diversification actually means in practice. Not just owning more things, but owning things that behave differently from each other at different points in time.

For an investor building a multi-factor portfolio, this matters more than any single year's return. A factor that does well when the others are doing badly reduces the swings in the overall portfolio. It lowers the risk of being completely on the wrong side of the market at the wrong moment. That benefit shows up not in the headline return, but in the smoothness of the journey.

Value walks its own road

Correlation of Value with other equity factors in India, the case for true diversification

	Nifty 500 Value 50 TRI	Nifty 500 Low Volatility 50 TRI	Nifty 500 Momentum 50 TRI	Nifty 500 Multifactor MQVLv 50 TRI	Nifty 500 Quality 50 TRI

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Calculations are for the period April 1, 2005 to March 31, 2026. Correlation based on excess returns of factor indices over Nifty 500 TRI. Past performance may or may not be sustained in future and is not an indication of future return.

Who is investing in Value?

Value has long been a meaningful part of how institutional investors approach equity markets.

Globally, pension funds, endowments and asset allocators have run Value strategies for years, often through dedicated mandates within their broader equity allocations.

That history shows up in how the factor is positioned in today's product

landscape.

Among the largest factor-focused exchange-traded funds in the world, Value remains one of the most heavily allocated to. The product list spans the major global asset management firms, each of which runs its own multi-billion-dollar Value ETF. Let's take a look at the top five Value ETFs (by AUM) across the globe.

Where global capital sits within Value

Top five Value-focused ETFs globally, ranked by assets under management

Source: Bloomberg. Data as of March 31, 2026.

The rise of Value ETFs

Rule-based value ETFs have steadily gained traction in the US market

Source: Bloomberg. Data is as of year end.

The picture in the US is striking. Across the smart-beta ETF universe, Quality has grown the fastest in percentage terms over the last decade. But Value continues to hold the largest pool of capital after Growth itself. That is not a recent development. It is the result of decades of institutional commitment.

India catches up, but the gap is closing

In India, the story has taken longer to begin. The first Value-focused passive funds arrived only in the last few years. But the trajectory is unmistakable. Value

India catches up

The sharp rise in passive value factor smartbeta funds' AUM and schemes in India

Source: ICRA, NJ AMC's Internal Research. Only passive value factor smartbeta funds are considered. Past data may or may not be sustained in the future.

factor based passive smartbeta funds' AUM has grown sharply between March 2020 and March 2026, alongside a sharp rise in the number of schemes available. The factor has moved from a footnote to a category in a relatively short window.

What India is seeing today is what mature markets saw 20 years ago. The factor is finally accessible at scale, through systematic, rule-based products that retail investors can buy. The institutional conviction that has anchored Value globally for decades is now reaching Indian portfolios through the smart-beta route.

Value trends across the globe

A pattern visible in only one market over one stretch of time is hard to take seriously. It could be a coincidence. It could reflect something specific to that market. Value, when you look at the data, shows up in more than one place.

It is visible in major equity markets that have been studied, with broadly similar patterns appearing across them.

This is what makes the factor worth taking seriously. The mechanism it relies on, paying less than what a

business is worth, does not depend on the rules of any one country. It depends on the simple fact that prices sometimes drift away from underlying worth.

What the regional data shows

The visual titled "The pattern holds across borders" lays out the picture across three regions. In the United States, the Value index has stayed in the neighbourhood of the broader market over the full period studied, ahead on some measures and behind on others. There have been long stretches where Value lagged, particularly during periods of falling interest rates and speculative bull markets, and the recovery in such cycles has tended to be slow.

Europe shows a modestly stronger picture over a shorter history. The Value index has held a small lead on

the broader market across the periods studied, though the absolute returns in Europe have been lower.

India is where the factor's case is more visible. Across the full period, the Indian Value factor has delivered a positive premium over the broader market, with the gap most pronounced in recent years. The Indian result is the most distinct of the three.

The pattern, not the precision

The point of the regional comparison is not the size of any one premium. It is the broader observation that, across very different markets with different rules and investor bases, the factor continues to register. The premium is not always large, and it is not always present in every sub-period. But it has not disappeared in the way a coincidence would.

The pattern holds across borders

Value's performance relative to the broader market in three of the world's major equity regions

Types of Value: Parameters compared

Value is one idea but it can be measured in multiple ways. Each of the standard Value parameters, P/E, P/B, EV/EBIT and dividend yield, looks at price from a different angle. Each tells you something the others don't. And each, when tested on 20 years of Indian data, reveals something useful about how the Indian market actually works.

What follows is a parameter-by-parameter walk-through of the evidence. Three of the four behave as Value theory would predict. One does not. Both kinds of results are useful.

P/E: The classic Value signal

The P/E ratio is the most familiar Value measure. A low P/E suggests you are paying less for each rupee of profit the company generates. The intuition is that, all else equal, lower is better.

The visual titled "Low P/E, higher reward" lays out the result. Over the period studied, the portfolio of 100 stocks with the lowest P/E ratios delivered

meaningfully higher annualised returns than the portfolio with the highest P/E ratios. The low P/E portfolio also outperformed the broader Nifty 500. The Sharpe ratio confirms the picture: better risk-adjusted returns from the cheaper end of the market.

EV/EBIT: A sharper signal for capital-intensive businesses

EV/EBIT compares a company's enterprise value against its operating earnings before interest and tax. The advantage of this measure is that it strips out the effects of how a company is financed and the taxes it pays, making it cleaner for comparing capital-intensive businesses across sectors.

The visual titled "EV/EBIT: A sharper lens for capital-heavy businesses" tells a similar story to P/E. The portfolio of stocks with the lowest EV/EBIT ratios outperformed the portfolio with the highest EV/EBIT ratios by a meaningful margin and also outperformed the

Past performance may or may not be sustained in future and is not an indication of future return.

broader market. Risk-adjusted returns clearly favoured the cheaper end.

Dividend yield: Cash flow discipline pays

Dividend yield turns the question around. Instead of comparing price to a fundamental anchor like earnings or book value, it compares the actual cash paid out to shareholders against the price you pay for the stock.

The visual titled "Dividend yield: The reward for paying shareholders" shows the largest spread of any of the four parameters. The portfolio of the 100 highest-dividend yield stocks delivered substantially higher annualised returns than the portfolio of the 100 lowest-yield

stocks. The high-yield portfolio also comfortably outperformed the broader Nifty 500. The bottom-yield portfolio returned far less than the market and roughly a quarter of what the top-yield portfolio delivered. Even allowing for the mixed signals high yields can carry, as discussed in Section "What is the Value factor", the broad pattern over 20 years is clear: the discipline of paying real cash to shareholders has been rewarded.

P/B: The exception that proves the rule

Three parameters down, three confirmations. The fourth tells a different story. The visual titled "P/B: The exception in the set" shows the inverted

result. The portfolio of stocks with the lowest P/B ratios underperformed the portfolio of stocks with the highest P/B ratios by a meaningful margin. The low P/B portfolio also underperformed the broader Nifty 500. This is the opposite of what classical Value theory would predict, and it reflects a real feature of the Indian market's evolution over the last two decades. The P/B result is not a failure of Value as a factor. It is a reminder that the same parameter, applied uniformly across industries, can give misleading signals. This is because relying solely on the accounting book

value is not ideal due to differences in accounting practices across businesses and industries, which limit its ability to reflect a company's "true" net worth.

What these four parameters together tell us

Three of the four parameters confirm that undervaluation is rewarded in Indian equities over long windows. The fourth is a reminder that no single parameter, applied uniformly across the market, captures attractiveness correctly for every kind of business.

Value needs the right yardstick

If you compare a bank's P/E with the P/E of a cement company, you might decide one is cheap and the other is expensive. Both might be operating well. The conclusion would still be wrong.

Different industries trade at different valuations, and always have. A bank with a P/E of 15 is not the same stock as a

cement company at the same multiple. The bank operates on borrowed money, earns from interest spreads and is heavily regulated; the cement company runs factories, holds inventory and lives or dies with the construction cycle. Their earnings mean different things, their risks differ, and the

market prices them accordingly.

Applying a single value parameter across the entire market without accounting for these differences is one of the most common mistakes in factor investing. While it looks systematic, it is actually misleading.

Why value parameters must fit the business

A useful value parameter aligns with the type of business being measured:

For asset-light businesses like information technology and media, dividend yield and earnings durability tell you more than P/E or P/B. Book value misses most of what these companies are worth. For capital-intensive businesses like metals, cement and infrastructure, EV/EBIT and free cash flow-to-enterprise value work better. Debt, depreciation and interest costs distort simple P/E comparisons. For lenders like banks and finance companies, neither P/E nor EV/EBIT works cleanly. P/B and loan book quality matter more.

Using one parameter for everything is like measuring temperature with a ruler. The tool is not suited to the job.

Introducing the NJ Value Score

The NJ Value Score addresses exactly this problem. The framework categorises every company by business type - considering cyclicity, capital intensity, financial profile and whether it earns from services or products - then applies the relevant value parameters.

A cement company is judged against the right yardsticks for similar capital-intensive and cyclical businesses; a bank against those for lenders. The result is a single value score per stock, built from parameters that fit the business - rankings are like-for-like across the market.

What the data shows

The visual titled "Right yardstick, better outcome" compares two approaches over two decades: one built using the NJ Value

Right yardstick, better outcome

How the industry-adjusted NJ Value Score has performed against a simple Low P/E approach

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Data for the period September 30, 2006 to March 31, 2026. Companies with negative earnings are not considered. Value Score Top 100 Stocks represents top 100 stocks based on NJ's Proprietary Business Specific Value Scoring Framework. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

Score, which adjusts for industry, and one built from the lowest P/E stocks across the market with no adjustments.

The score-based portfolio outperforms on every measure that matters: higher returns, lower volatility, shallower drawdowns, lower probability of losing money over five years, and consistently better rolling returns across one-, three-, five- and ten-year windows.

Value works across size and industries

There is a common belief in factor investing that Value performs best in the most liquid markets. The reasoning sounds sensible enough. The data, however, tells a different story. Value is not a large-cap-only factor. And once you look at it the right way, it does not concentrate in narrow market pockets either.

A: Value across market caps

The first test is to apply the NJ Value Score across large-, mid-, and small-cap universes separately and see whether the same pattern holds. Stocks within each cap are sorted into three groups by their Value Score: the top third, the

middle third and the bottom third. If Value works as a factor, the top third should outperform the bottom third within each universe.

The visual titled "Where the dispersion lives" lays out the result, with median rolling returns across one-, three-, five- and 10-year windows. Across each market cap universe, the most undervalued (top tercile) outperformed the most overvalued stocks (bottom tercile). Such performance is indicative of value's ability to capitalise on the inefficiencies of the market.

Where the dispersion lives

The gap between cheap and expensive stocks is largest where coverage is thinnest

Market capitalisation	Portfolio/Index	CAGR (%)	Annualised volatility (%)	Max. drawdown (%)	5Y loss probability (%)	Median rolling return (% p.a.)

Value is measured based on NJ's Proprietary Business Specific Value Scoring Framework. Median value alpha is the median difference between five-year rolling returns of the top and bottom half within each business model group and excess volatility is the difference in annualised volatility between the two. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

B: Value across business models

The second test goes deeper. In the Indian equity market, NJ AMC classifies stocks into nine broad business models based on business type. The question is whether the Value premium holds across these groups, or whether it is concentrated in a few sectors and absent elsewhere.

The headline finding is striking. Of the nine business models studied, most undervalued stocks outperform most overvalued stocks across all groups. The same is true for volatility. In all nine groups, most undervalued stocks are less volatile than most overvalued

stocks. The factor is not a sector trade.

It works across the whole market.

But the picture is more interesting once you look within the groups. The strength of the Value signal is not the same everywhere.

What the pattern means

The Value premium is real but uneven. It is largest where research is thinnest and information moves slowly.

Broadening the universe to mid- and small-caps and applying industry-aware scoring captures more of the factor's edge. Thus, Value works by going against the broader trends to find inefficiencies.

Value's cyclicalality is the point

Every factor goes through periods of underperformance. Quality lags during speculative bull markets. Momentum crashes when the trend breaks. Low volatility gives up ground in fast-rising markets. Value's underperformance windows tend to be longer than most.

There are stretches, sometimes lasting three to five years, when Value has lagged the broader market and other factors have dominated. Two market environments are particularly hard for Value:

- **Falling interest rate periods**, when borrowed money is cheap and investors are happy to pay high prices for

growth stories.

● **Speculative bull markets**, when narrative-driven stocks pull ahead of fundamentally cheap ones.

During these phases, Value can look out of fashion.

This is not a flaw in the factor. It is the cost of how the factor earns its premium. Value rewards investors for buying things others do not want, and the wait between buying and being proven right can be long and stressful. The investors who eventually capture the Value premium are the ones who hold through periods when no one else wants to.

How Value behaves across market crashes and recoveries

Value's deeper drawdowns in crises are not accidental. By construction, Value portfolios overweight capital-intensive, cyclical sectors - financials, energy, materials and industrials - that carry elevated operating and financial leverage. In downturns, these sectors are hit first and hardest: high fixed costs amplify earnings declines, while tighter credit conditions raise refinancing risk for already-leveraged balance sheets. As investors rotate toward quality and defensive businesses, cyclical and asset-heavy names get de-rated further. The result is sharper and more prolonged

drawdowns relative to the broader market.

The two most useful event studies in recent Indian history are the Global Financial Crisis of 2008 and the COVID crash of March 2020. Both confirm the pattern. During the GFC correction, the Nifty 500 Value 50 fell by over 60 per cent - one of the deepest drawdowns among major factors in the period. But the recovery that followed was the strongest. Value surged by over 200 per cent in the post-crisis phase, well ahead of every other factor. Investors who held through the correction were the ones who captured the recovery.

The COVID crash followed a similar arc. Value fell more steeply than other factors in the initial sell-off, as the market punished cyclical and economically sensitive stocks first. The recovery, once it began, was sharp and remained strong well after the initial bounce faded.

The pattern is consistent. The same characteristics that make Value fall harder - cyclical exposure, leverage, sensitivity to economic fear - become tailwinds in the recovery, as the gap between price and underlying worth widens in the crash. The bigger the fear, the bigger the eventual recovery.

What the longer record shows

Beyond the two crises, the broader

Value's outperformance comes in waves

Nifty 500 Value 50's three-year rolling outperformance (alpha) over the Nifty 500

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). pattern of Value's cycle plays out over longer time windows.

Over the last two decades, there have been multiple periods where Value has lagged the broader market for years at a stretch, and equally clear periods of outperformance. The factor moves in long cycles, and those cycles are real. What also shows up over the longer record is that the median outcome across these cycles has been positive. The bad stretches have been followed reliably enough by good ones to leave a patient investor better off.

Cheap vs genuinely undervalued stocks

Buying cheap stocks sounds straightforward. Find companies trading at low prices relative to their earnings, their book value or their cash flows. Buy them. Wait for the market to correct the gap. In practice, it does not always work. Some stocks are cheap because they deserve to be cheap. The business is broken, the earnings are about to fall, the balance sheet is fragile, or the management is making poor decisions. Buying these stocks does not make you a value investor. It makes you the holder of a value trap.

What a value trap looks like

A value trap is a stock that looks cheap on paper but stays cheap, or gets cheaper, because the underlying business is failing. Earnings deteriorate over time, making the P/E ratio look attractive for the wrong reasons. The book value erodes as the company writes down assets. The dividend, if there is one, gets cut. By the time the market has finished pricing in the bad news, the investor who bought

the stock at what looked like a discount has lost a substantial part of their capital.

Value traps are not rare. They are common enough that a value strategy, which buys only on cheapness, without filtering for business quality, will pick up a meaningful number of them. The result is a portfolio that looks good on the undervaluation scorecard but performs poorly in real money terms.

When cheap is not enough

Not every stock that scores well on a Value screen belongs in the portfolio. Some look cheap because the market has mispriced them - these are the genuine opportunities Value is designed to find. Others look cheap because the underlying business is failing. These are value traps, and no valuation screen alone can tell them apart.

Reliance Power Ltd. is a textbook illustration. See the chart titled "Reliance Power: The trap that looked like a bargain." At the end of August 2016, the

stock was trading at a P/E of 16.1 times, which had compressed to 11.5 times by August 2017, making it look like a cheaper, more compelling buy. Notably, while the stock appeared expensive relative to its peers' median P/E of 12.5 times in August 2016, the tables turned a year later, in August 2017, when peers were trading at 15.4 times, making Reliance Power look attractive by comparison. The quality signals said otherwise: return on equity stood at just 4.4 per cent in August 2016 and barely improved to 5.2 per cent a year later; debt-to-equity remained elevated at 1.67 times, easing only marginally to 1.54 times; and promoter pledge as a share of total promoter holdings had climbed from 53.3 per cent to 61.8 per cent, signalling growing financial stress at the ownership level. The market eventually priced in the deterioration. From August 2017, the stock delivered -6.7 per cent over the following 12 months and severe wealth destruction of -92.0 per cent over 24 months.

A purely valuation-driven approach would have flagged it as a buy at precisely the wrong moment. Price alone does not make a stock cheap - it is only genuinely cheap when the underlying business deserves a higher price than the market is offering.

What filtering does for a value strategy

The previous section of value trap shows the cost of getting cheapness wrong. The next test shows what disciplined filtering can do on top of an already industry-aware Value score.

The visual titled "What filtering adds" compares three approaches. The Top 100 stocks by Value Score is the top tercile of stocks by NJ Value Score, with no further filter. Top 100 stocks by Value Score after Quality & Volatility Filters uses the same starting universe but removes stocks that score poorly on quality or exhibit extreme volatility, then ranks the

Reliance Power: The trap that looked like a bargain

A falling P/E hid a worsening business underneath

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJ AMC). The return (%) figures shown represent absolute returns. For illustration purposes only. Stock prices are adjusted for corporate actions, if any. Stock mentioned above is for illustration purposes to explain value factor and should not be construed as advice/recommendation either to buy or sell. The stock may or may not form part of schemes' portfolio. Past performance may or may not be sustained in future and is not an indication of future return.

remaining stocks by Value Score. The Nifty 500 TRI sits as the benchmark.

Both value approaches outperform the broader market by a meaningful margin. The filtered version edges ahead of the unfiltered one on returns, holds a slightly better Sharpe ratio, and produces a smaller drawdown. The improvement is real, though not dramatic. The bigger gain shows up in the rolling returns, where the filtered version pulls further ahead of the unfiltered version across five- and ten-year windows.

Why this matters for product design

The case for filtering is practical. A retail investor cannot easily replicate a multi-

stage process that combines an industry-aware Value Score, a quality filter, a volatility filter and disciplined rebalancing. Applying these checks at scale requires data on balance sheets, cash flows, earnings consistency and risk measurement that sit within a structured research platform and an investment grade process. This is why rule-based value products matter in India today. The factor itself has been understood for a long time. The infrastructure to implement it well, capturing the value premium while avoiding the traps, has only recently become accessible through rule-based Value factor funds. What was once an institutional capability is now available to retail investors.

The broader point is simple. Value as

an idea is easy to understand. Executing it well is not. That gap is what separates a factor that looks good in theory from one that delivers in practice.

What filtering adds

Quality and volatility filters do real work on a Value portfolio that is already industry-aware

Portfolio	Annualised return (%)	Sharpe ratio	Annualised volatility (%)	Max. drawdown (%)	1Y loss probability (%)	Median rolling return (% pa)	
						5-Year	10-Year
Top 100 stocks by Value Score after Quality & Volatility Filters	18.8	0.52	18.5	-65.4	23.1	19.7	20.2
Top 100 stocks by Value Score	18.4	0.48	20.2	-66.4	28.6	17.4	19.7
Nifty 500 TRI	11.6	0.28	19.9	-63.7	21.2	13.4	13.6

Source: NSE, CMIE, NJ Asset Management Private Limited Internal Research, NJ's Smart Beta Platform (in-house proprietary model of NJAMC). Data for the period September 30, 2006 to March 31, 2026. Top 100 stocks by Value Score after Quality & Volatility Filters are based on NJ's Proprietary Business Specific Value Scoring Framework, after filtering low quality and high volatile stocks from Nifty 500. Top 100 stocks by Value Score are based on only NJ's Proprietary Business Specific Value Scoring Framework. This data represents a back-tested simulation and does not represent the performance of any existing mutual fund scheme managed by NJ Asset Management Private Limited. Past performance may or may not be sustained in future and is not an indication of future return.

Should you invest in Value?

Every section of this supplement so far has been about the factor. This one is about the investor. Whether Value works as a strategy is a matter of data, and the data has

answered. Whether Value works for you is a matter of temperament, time horizon and self-knowledge, and only you can answer it honestly.

For whom is the Value factor suitable

Value is a proven factor, but it can underperform for long periods. During both the 2008 Global Financial Crisis and the 2020 COVID-19 crash, it fell harder than other factors before rebounding more strongly.

Value investing demands patience. Five-seven years is the bare minimum holding period; ten years is more realistic. Investors with shorter horizons or those unwilling to endure extended periods of underperformance may abandon the strategy before the premium materialises.

A story the data tells unusually well

Consider an investor sitting on March 31, 2020, looking at five-year returns of the major factor indices.

An investor who committed to Value in March 2015 was sitting on an absolute 30 per cent loss five years later. Every other factor had done better. The case for switching would have looked strong.

Now look at the same picture as of March 31, 2026.

The factor that had been the worst performer over the five years to March 2020 became the best performer over the five years to March 2026, that too by a staggering margin. The reversal was not gradual. It was the direct result of

holding through the worst moment.

Over the last 21 years, Value's median five-year rolling return of 14.3 per cent, comfortably ahead of the broader market's 13.6 per cent, confirms that the bad windows are followed reliably enough by good ones to leave a patient investor better off.

What the recoveries from crises show

The post-GFC recovery (April 2009 to December 2010) tells the same story. Value delivered 228 per cent, the strongest of any factor index, against the broader Nifty 500's 117 per cent. The post-COVID recovery (March 2020 to December 2021) repeated the pattern. Value delivered 192 per cent, well ahead of the broader market's 140 per cent. In both crises, Value fell hard. In both recoveries, it bounced harder. This is the temperamental contract Value asks an investor to accept.

Inherent diversification benefits make a strong case for Value

The factor's low correlation with all other factors, specifically Momentum and Quality, established in the Section titled "Why the Value factor matters", means that adding Value to a portfolio containing those factors reduces

From worst to first

Index	5Y return %	
	As of March 2020	As of March 2026
Nifty 500 Value 50 TRI	-6.7	28.5
Nifty 500 Momentum 50 TRI	4.7	16.5
Nifty 500 Low Volatility 50 TRI	5.4	14.9
Nifty 500 Quality 50 TRI	1.8	12.8
Nifty 500 TRI	1.3	11.9

Rebounds reward the patient

Past performance may or may not be sustained in future and is not an indication of future return.

overall swings. Even when Value is having a poor stretch on its own, it often holds up when the others are struggling.

For whom Value works and for whom it doesn't

The honest answer is that not every investor can hold Value through its difficult periods.

Value is the right factor for you if:

- You have a horizon of five-seven years or longer.
- You can hold a position that lags the broader market for years at a stretch without exiting.
- You understand that cheap stocks often look cheap because the market may be overly pessimistic about them.

- You measure success over full cycles, not against year-to-year benchmarks.

Value is the wrong factor as the centre of your portfolio if:

- You lose conviction when you fall behind the market.
- You will exit a position after two or three years of underperformance.
- You need access to the money in less than five years.

For investors in the first category, the case is strong. For investors in the second, Value can still play a role as a satellite position. What it cannot be is the entire portfolio.

The question is not whether the factor works. The question is whether you have the temperament to use it.

The road ahead

Predicting which factor will lead the next cycle is not the purpose of this supplement. More honestly, it looks at the current setup and asks whether conditions that have historically favoured Value are in place. Several of them are.

Macro setup favours Value

Three shifts in the current investing environment have, historically, been associated with periods of Value outperformance.

Rate normalisation. Global rates have normalised after more than a decade. Higher rates compress the multiples investors are willing to pay for growth stocks. This is a structural tailwind for stocks that earn now rather than promise to earn later.

Earnings over narrative. After recent speculative bull markets, the market has shifted attention back to current earnings, cash flows and capital discipline. Stocks that demonstrate these qualities now are being rewarded for them.

The fading speculative growth premium. The gap between growth and

value stock valuations widened to unusually high levels during the speculative phase. Historical reversion in such cycles plays out over the years that follow, not the years that initiate the shift.

None of these guarantees that Value will lead from here. But the conditions that have historically preceded long Value rallies are in place.

Where Value's premium actually lives

The visual titled "Where you buy decides what you earn" tracks Value's performance by its own valuation zone. In the undervalued and fairly valued zones, measured by comparing current valuation against historical averages, Value has delivered meaningful excess returns over the Nifty 500. In the overvalued zone, excess returns turn negative. Where Value sits in its own cycle matters as much as whether Value itself is a good idea.

As of April 30, 2026, Value sits in a favourable part of that cycle. Against its three-year history, the P/E of the Value index stands at 0.97 times its average, in the undervalued zone. Against its five-year history, it stands at 1.07 times - fairly valued. Both readings suggest a good starting point.

The closing case

Value's defining characteristic is that it underperforms in some years precisely because it outperforms in others. The investor who captures the premium is the one who stays in the seat when the cycle turns against them. Many leave that seat empty at exactly the wrong moment.

What makes this easier is that Value does not have to carry the whole portfolio. Its low correlation with other

Where you buy decides what you earn

Value's edge is widest when you buy it cheap

Valuation Zone	Excess returns over Nifty 500 TRI	
	12 Months (%)	24 Months (%)
Overvalued Zone	-0.8	-5.8
Fairly-valued Zone	9.8	12.1
Undervalued Zone	9.3	11.8

Data covers the period September 30, 2011 to March 31, 2026. The analysis is based on a portfolio comprising the top 100 undervalued stocks selected from the Nifty 500 universe using NJ's proprietary business-specific value scoring framework. Companies with negative earnings are excluded from the universe. Valuation zones are determined by comparing the portfolio's current valuation with its 5-year historical average and are identified on a half-yearly basis. Returns shown represent median excess returns for the respective valuation zone, calculated across all half-yearly observations, for the subsequent 12-month and 24-month periods. Past performance is not indicative of future results.

factors means even a satellite allocation meaningfully improves outcomes. A 100 per cent Quality allocation outperforms the Nifty 500 TRI in 12 out of 22 calendar years, with a three-year outperformance probability of 70.44 per cent.

Adding just 20 per cent Value lifts both - 14 out of 22 calendar years and 74.23 per cent on the three-year window. An equal-weight blend of Quality, Value and Momentum takes it further: 16 out of 22 calendar years and 86.56 per cent. Different factors thrive in different environments - blending them reduces the stretches of underperformance that any single factor experiences on its own.

The factor has worked. And the reasons are not mysterious. Value investing has a logic to it: buying businesses at prices below what they are worth, then waiting for the gap to close. That logic does not expire.

But a long record is context, not a reason to act. The real question is whether value fits your portfolio and your time horizon. Past returns tell you

Blend is where the edge lives

A blended factor allocation outperforms a single-factor portfolio on every measure

Allocation	Sharpe ratio	Calendar year outperformance against Nifty 500 TRI	3Y outperformance against Nifty 500 TRI (%)
100% Quality	0.55	12/22	70.44
80% Quality and 20% Value	0.54	14/22	74.23
33% Quality, 33% Momentum & 34% Value	0.57	16/22	86.56

Data is calculated for the period April 1, 2005 to April 30, 2026. Momentum, Quality, and Value are represented by respective Nifty 500 Factor 50 TRI counterparts and are rebalanced annually. Numbers are per tax. CY 2005 and 2026 do not represent a complete financial year. Past performance may or may not be sustained in future and is not a guarantee of any future returns.

what value has done. They do not tell you what you should do.

What they do suggest is that value merits attention. Combining it with other factors brings a different engine into the mix, one that tends to fire when the others are idling. ☒
