Silent partners

Dhirendra Kumar
Editor-in-chief

In the West, people live their lives as individuals. In India, we live our lives as parts of a whole. The whole could be a family or society, but it's the main thing. What does this have to do with retirement planning, you might ask?

Some months ago, we did a cover story about retirement planning. It was a perfectly good, well-thought-out article, except that, as we later realised, it treated retirement as a clone of the Western idea. In that world, you could ask someone who is retiring what he has saved, and you would get a single figure - a sum of PPF, FDs, NPS, equity, etc. - that you could just apply to his life with some withdrawal rate in mind, and that would be a good basis for planning. This is not the world we live in.

In our world, many implicit claims on our retirement kitty are a byproduct of our social and family norms. Some of these claims might be formal, but most exist only in the understanding between people who love each other and would not think to write it down. A daughter's wedding might be non-negotiable, or parents may need far more support for much longer. *Suraj Kaeley's Desi Retirement Plan brought out this dimension well, entirely in an Indian context, and it is one I have personally experienced. The nuclear family in India is not a societal design. It is a byproduct of jobs, careers and urbanisation. The household*

separates, but the claims do not.

What makes this easy to ignore in formal calculations is that it feels like it exists outside the world of spreadsheets and XIRRs. If we mark which portions of our savings belong to which family member, it feels like we are treating our loved ones as pages of a ledger. Therefore, these claims stray off the books, and the retiree's corpus ends up funding two or three lives where it was supposed to fund just one.

- Hidden family claims shrink your retirement corpus
- Subtract promised money before you start planning

I have written earlier about the instinct that lets a careful saver hold 20 or 30 funds whose purpose he cannot explain, except that each had a logic at the beginning. This habit of overcounting our money is the same kind of instinct. It makes us feel rich and generous because we have lots of money, whereas, in reality, that money is already spent.

Practically every Indian will immediately understand this. However, this simply makes the real problem worse. The real problem is the 4 per cent or 6 per cent withdrawal rate that we smoothly talk about. That's just fiction. Retirement planning is actually an attempt to predict the next 30 or 35 years, and a prediction across that scale of time is

certain to be wrong.

We do not know what the inflation rate will be, and small differences in it can compound into large ones. A corpus which is comfortable at 6 per cent inflation can have you living in poverty if inflation rises to 8 per cent. Nobody making a plan for you when you are 60 can tell you which of these are actually your future. We do not know what healthcare will cost, or when those costs will arrive, or how long our lifespan will be and how long our 'healthspan' will be, which is the single biggest uncertainty that will dominate all others. A retirement plan is a piece of fiction which, if we are lucky, will have some resemblance to reality.

That is why our cover story asks you to run an audit. Almost everything about your retirement is unknown and will have to be adjusted as life's surprises arrive, and the money you have already implicitly promised to other people is just one of them. You cannot make the future behave as you wish, and you should not let a neat Excel sheet convince you otherwise. However, you can be aware of these things and refuse to believe fairy tales. Therefore, before you plan according to any rule we have ever given you, do the subtraction first. Write down all the money that you have promised away and adjust for a future without it. The smaller kitty will make you worried, maybe even drive you to panic, but it will eventually do you good.

Note for Note

A monthly report in which readers answer the Editor's Note and the page keeps score

Swaminathan Ramachandran is 74 and describes himself as a fan who cannot stop reading. His father, a middle-class central government employee, raised eight people in the same house, funded five daughters' weddings, donated lakhs to hospitals and temples on a government salary and walked to the office every morning. His sole financial instrument was a Sundaram Finance fixed deposit. An Ahmedabad friend named Tushar Mehta supplied the formula that explains his father's life: income minus saving equals expenditure, not the other way around.

Four notes in July, each asking for a different form of the same restraint.

The note of July 4 showed with arithmetic that how much you save matters more than which fund you pick. The note of July 11 argued that looking at your portfolio once a year serves you better than looking at it every day. The note of July 18 argued that a bubble is a property of human psychology, not of the technology it inflates. The note of July 25 returned to the household. The cloth-bag system in the almirah that a financially

Aprajita Anushree/AI Generated Images

educated person dismisses as inefficient was doing something that allocation models often miss: protecting each goal from the others, and all of them from the self that will always find a good reason to redeploy the money.

The inbox confirmed each claim and then pressed on it. Readers tested the notes with their own SIP records, family histories and portfolio audits. Two drew serious objections, which are reported in

full on the pages that follow. The months when a claim is challenged sharply are the months this feature is most useful.

What July showed is that readers rarely need convincing on principle. What they need are the working details the notes left out: which tool to use, how the tax rule applies, how to actually separate one goal's money from another's. Four of those questions now sit in the ledger.

LETTER OF THE MONTH

Swaminathan Ramachandran

His father provided for eight people on Sundaram Finance FDs alone, funded five daughters' weddings and donated lakhs to charities on a government salary.

In response to · Stop fussing over where to invest · July 4, 2026

We Don't Know What Happens Next.

That's true every day. You're just feeling it now.

You checked your app this morning. You felt it in your stomach before the numbers loaded.

What you're feeling is not panic. It's something quieter and worse: the suspicion that maybe this time it's different. That the ground has shifted, and nobody told you what to do.

We know that feeling. We've seen it in the eyes of people who trusted us with their savings and wanted us to say something reassuring that we couldn't honestly say.

We don't know what happens next. We don't know when this ends, when it gets better, or if it gets worse first. We can't predict oil prices, geopolitics, or the next notification that turns your screen red.

But here are some truths we do know.

Every time it felt like the end of the world, it wasn't. Not in 2008. Not in 2020. Not today in 2026, or in the dozen crises in between. Every crash feels unique. The reasons keep changing. The fear doesn't.

Investors who lost the most were not the ones who stayed. They were the ones who left. The cost of selling at the bottom, of re-entering after the recovery, is almost always greater than that of sitting with discomfort. These chills that are running down your spine? This is what earns returns.

Your brain is lying to you right now. It's telling you to wait for clarity. But markets never send a notification saying, *'The danger is over, invest now.'* It's telling you to do something. Sell, pause, anything! Because action feels like control. But what you've lost is not money. It's the feeling of control. And selling won't give it back.

So, what should you do? Not nothing. And not everything.

If you have SIPs running, don't stop them. This is the moment they were designed for. Continuing to invest when it's the hardest means buying more units at lower prices. Remind yourself, *"I will not stop."*

If you have idle money and 10 years, put it to work. Not all of it. Not recklessly. The best days in market history have almost all come within weeks of the worst days. You cannot capture one while perfectly avoiding the other.

If you're all in, know that this is not the first storm, and it won't be the last. Remind yourself that those who do better are not the ones who were wiser. They were calmer.

If you're unsure, call your MF Distributor or your advisor, if you're lucky enough to have one. They know your life, not just your portfolio. Their value is even greater in uncertain times. Not for predictions. For perspective. So you can outlast the discomfort. And make decisions you won't regret three years later.

If you must check your portfolio, check it less. Your phone will not stop buzzing. Group chats will not stop panicking. NAVs will not look good for a while. That's not a failure of your plan. It's what a plan looks like when being tested. Your only job right now? Let the plan keep working.

Does doing nothing work? One of the world's greatest investors, when asked how much he lost when stocks fell 50% in 2008, said *"Nothing – because I did nothing."* The markets recovered. He was still in them when they did.

You can't do much about what happens next. But you can decide whether you will stay the course while those around you are losing their nerve.

Staying is not comfortable.
Which is why, most people leave.
What about you? **Will you be unaverage?**

An investor education & awareness initiative by

Stop fussing over where to invest

July 4, 2026

The claim

How much you save matters far more than which fund you pick. Two savers, both starting from nothing, investing for 10 years. The first puts away ₹20,000 a month and earns 8 per cent. The second reads everything, picks brilliantly and earns 14 per cent, but saves only ₹12,000 a month. After 10 years, the first saver has ₹36 lakh and the second ₹32 lakh, despite the return advantage.

Contributions do the heavy lifting in the early years. Returns matter only once the base is large enough to compound.

What you proved

Pema Bhutia has been steadily raising her SIP to around ₹40,000 a month and generates good returns even in a sideways market, crediting the amount rather than the fund selection. **Ankit Gupta** had been meaning to increase his SIP for over two years, paralysed by the memory of a bad fund pick and the question of where to put the

additional money. He read the note and decided to invest in an index fund that morning.

What one reader disputed

Suresh Kalra has been following long-term-stay-invested advice for years and finds his returns far inferior to what was promised. He described the note and others like it as nothing but the marketing agents of the mutual fund industry. Investors face a bewildering number of funds with every advisor pushing different ones, he wrote, and the phrase “long term” is so

vague that no one can ever be held to account for it. The only investments he finds worthwhile are those made when markets crash, not the ones made through normal periods.

Still open

Nupur Khatu noted that the note said nothing about when to sell. Everyone, she wrote, explains the buying side. Nobody explains profit-booking from a purely investment standpoint, outside of emergencies or planned life events. It goes to the ledger.

Look once a year, not daily

July 11, 2026

The claim

Feedback that arrives too fast produces action that is mostly noise. Four checks actually matter: how much you are contributing each month, whether your asset allocation has drifted, whether your holdings are genuinely diversified underneath the surface, and what capital gains tax is building up. These run on a yearly clock, not a daily one. Watching the frightening

number at the top of a screen every morning is not a check. It is anxiety with a green-and-red interface.

What you proved

Nayan Sen stuck to his SIPs through a market rally, did nothing and on withdrawing found ₹30 lakh in profit he credited to that deliberate inaction. **Sameer Walia**, a multi-decadal investor who lived through the Harshad Mehta era,

told his RIA he wanted only quarterly summaries. His RIA was shocked. He distinguishes between volatility, which is a feature of markets, and risk, which changes slowly. For a 20-to-30-year investor, monthly summaries are a distraction.

What one reader disputed

Dattatray Kulkarni was not arguing for daily checking but for checking

PGIM

India Mutual Fund

more than once a year. Four years ago, his entire ₹25 lakh holding in a folio was transferred to a layman as legal heir, due to a processing error on a nomination, and the money was withdrawn. He discovered this only while checking AIS at tax-filing time; the eCAN balance had shown full holdings even after the withdrawal. The folio was restored after he raised it with the AMC. He now tallies MFU holdings against CAMS and KFinTech periodically. The note treated frequent checking

as the investor's main enemy. His story added another: errors that go undetected when nobody is looking.

Still open

The note named capital gains tracking as one of four essential checks but offered no guidance on what to do once you find the number. **Darshan Rathod** asked how a retail investor should think about annual tax-gain harvesting without turning a simple plan into something over-engineered.

The AI bubble question

July 18, 2026

The claim

A bubble is not a property of the technology. It is a property of the people buying. François Chollet, who created Keras and devised the AI industry's progress benchmark, made the point: a thing can be a bubble even if the technology works, demand is real and it is already making money. All it requires is people betting with too much enthusiasm and then panicking together. Whether AI is a bubble cannot be answered in advance. A diversified investor need not solve the question. The only part you control is how much you bet and whether you panic.

What you proved

Ramalingam found the note correct but added a distinction it had not made. In every previous bubble, the underlying asset retained value: railways ran for 50 years, fibre-optic cables enabled the internet that followed. In this cycle, the primary

capital expenditure is the chip, which goes obsolete in three to five years. If a crash comes, the capital is gone, with no infrastructure left for the next generation. **Amitava Tripathi** reached for Shakespeare, "the fault, dear Brutus, lies not in our stars, but in ourselves that we are underlings", and added something the note had not considered: in order to trap the retail investor, the promoter himself can fall into the trap of the hype he created.

What one reader disputed

Ntimes Wealth Creations found the note over-intellectualised to the point where the reader comes away with nothing usable. It argued the note should have addressed three questions it had skipped: how should an investor approach the bubble given that its resolution depends on mass behaviour? How do successful investors of contrasting styles deal with this? And what is the investor's real objective:

to be right, or to generate a return however the future develops?

Still open

Jeslin Sugirtha noted that a broad index may appear diversified across hundreds of companies while its returns are actually driven by a handful of names exposed to the same AI narrative. The note said a sensibly diversified investor need not worry. She asked what happens if the sensible index is itself the hidden concentration.

Presenting

Invesco India Pharma and Healthcare Fund

NFO Period: 18 Aug - 1 Sep, 2026

Invest in the lifeline of India's economy.

**Pharma and healthcare is India's next big growth story.
Use it to build long-term wealth.**

Protect your goals from yourself

July 25, 2026

The claim

The cloth-bag system in the almirah that a financially educated person dismisses as inefficient was doing something important: creating friction between the household and its worst impulses. Money made fungible can always be borrowed from one goal to feed another, with a perfectly reasonable story to justify it. Separating money by goal protects each goal from the others, and all of them from you. The test: point at the actual holdings behind your child's education. Not the rough share of the total you assume covers it. The actual holdings.

What you proved

Sukanya Hazarika did the audit and found a shortfall: she had been investing, but not enough for what her children's education would cost. She opened two dedicated mid-cap funds tagged for that goal, alongside existing Sukanya Samriddhi Yojana contributions, then noted that the rest of her portfolio still lacks the same separation. Whenever she thinks about a trip to New Zealand,

she has no clear answer about which money to use. **Ranganatha Thirumalai Krishnamurthy** pointed to the Provident Fund as the institutional version of the same idea: deduction at source, employer contributions going directly to the fund, withdrawal restrictions. All versions of the drawstring, now being untied by liberalised PF withdrawal rules.

What one reader disputed

Swapnil Bhardwaj is saving 60 per cent of his income and investing all of it through SIPs. When his friends went to Thailand, he could not go because everything was committed. He understands the arithmetic. But

he ended his letter with a question the note never addressed: "Am I a miser?" The note told readers how to protect their goals. It said nothing about whether youth and enjoyment are themselves goals that deserve a drawstring.

Still open

Shashank Shukla has recommended Value Research to dozens of people for its goal-based portfolio-labelling feature. He points out that the option to create new labels has been disabled for several months. The note asks readers to separate money by goal. The platform it comes from cannot currently help them do it. [☑](#)

The ledger

Several readers asked questions that went further than the notes did. The ledger carries them forward.

Reader	Week raised	The question	Status
Nupur Khatu	July 4	The note said to save more and choose dully. When should you sell? Nobody explains profit-booking from a purely investment standpoint.	Open
Darshan Rathod	July 11	How should a retail investor do annual tax-gain harvesting without turning a simple plan into something over-engineered?	Open
Jeslin Sugirtha	July 18	If a broad index is itself the hidden concentration risk, how can an investor reduce it without timing the market?	Open
Shashank Shukla	July 25	The goal-labelling feature on Value Research that enabled goal-based tracking has been disabled. What should readers use now?	Open

Methodology: Every figure on these pages is quoted as the reader stated it, in letters received between June 6 and July 3, 2026. Rupee amounts, allocations and dates are the readers' own and have not been independently verified.

Parag Parikh's Thakkar promises single-digit cash

Four claims in the PPFAS letter that investors can verify themselves

By Aakar Rastogi

Rajeev Thakkar has told unitholders that the cash in Parag Parikh Flexi Cap Fund has fallen from a peak of near 25 per cent to 14 or 15 per cent, and will reach single digits. Monthly portfolio disclosures will show whether it does. Nothing else in his letter dated August 4 can be checked as cleanly.

The letter answers two hard years. The fund lost 9.97 per cent in the fourth quarter of FY26 against the Nifty 500 TRI, and its five-year annualised return is 13.77 per cent. At ₹1.43 lakh crore on June 30, it is India's largest actively managed equity scheme.

Value Research rates it five stars.

Critics blame the size. Thakkar rejects that, and points to 2007, when he managed a worse stretch of underperformance on a portfolio management book of a little over ₹100 crore. The strategy explains it better. A fund that buys stocks and sectors the market has turned against will trail for stretches of a year or more. This one is ordinary by that standard. Nifty 100 trades at 20.8 times earnings, Nifty Midcap 150 at 30.7 and Nifty Smallcap 250 at 34.6 (screener.in, August 4). Small companies cost about two-thirds more per rupee of profit than large ones. Anyone treating it as a law of physics that smaller companies deliver higher returns, he

writes, should look at the US.

On IT services, he is buying the sell-off, and says this makes him an outlier. AI may write much of the code, but the work of implementing it remains, and attackers using AI will create demand for cyber security. He cites two essays by Benedict Evans (see the box below).

He declines the fashionable themes. No Defence, no Energy Transition, no Fintech and no direct holding in the companies building AI models, though he owns the hyperscalers selling the computing beneath them.

HDFC Bank is the fund's largest holding at 8.33 per cent, and he is staying. The problems reported so far are unwelcome, he writes, but do not threaten the customer franchise, and he separates them from what he describes as the fraud at one private bank and the under-reported derivatives losses at another. He held ICICI Bank through similar criticism.

Read it as a document you can hold him to later, which is more than most fund manager letters offer. It gives no reason to sell a five-star fund behaving as a flexi-cap fund should across a full cycle. Note the cash figure today, then check the March 2027 portfolio disclosure. That number will tell you whether he meant it.

What Benedict Evans argued

Thakkar's letter points readers to two essays by Benedict Evans, a technology analyst, as background for his view that fears about AI and employment are overblown at the aggregate level. This is one of them, AI and the automation of work, published in July 2023. Automation has destroyed jobs for 200 years, he argues, and every wave created new ones nobody could forecast. The lump-of-labour fallacy is the mistake of assuming a fixed quantity of work exists.

The Jevons Paradox says that making something cheaper leads people to use more of it. Typewriters let one clerk do the work of 10, and employers hired more clerks. The computer spreadsheet arrived in 1979, and accounting employment rose.

A language model does not look up an answer. It produces the kind of answer such a question usually attracts. It is useful wherever you want interns who draft fast and whose work you then check. ☑

2026 has already sacked last year's winners

Last year's top-performing categories have changed sharply, showing how quickly the fund tables can turn

By Aakar Rastogi

On January 1 this year, the average flexi-cap fund had a certain NAV. Seven months later, it is back at the same place. The category's return for 2026 so far is 0.6 per cent. Large-cap funds are down 2.6 per cent. ELSS is down 0.9.

So nothing happened this year? Hardly.

February was the worst month technology funds have had in years, down 16.7 per cent as AI shares fell around the world. In March the selling reached everything else. Large-cap funds lost 11.6 per cent that month, mid-caps 10.7, small-caps 9.7, and the newspapers were full of explanations for why this was only the beginning. Then April arrived and undid all of it. Small-cap funds gained 16.1 per cent in a single month, mid-caps 12.8, large-caps 9.3. If you had gone travelling in February with no phone and no newspaper, you would have returned in May to find your portfolio roughly where you left it.

We wrote about this in April, in a column called *Nothing ever happens*. It described a bot on Polymarket, the prediction market, that bets 'No' on every question, because most of the things people fear never actually occur. The bot would have enjoyed this half-year. The investor who did nothing lost

Yogesh Sharma/AI-generated Image

nothing. The investor who sold in March turned a temporary fall into a permanent one, and then watched April from the sidelines.

Look at the left of that table. Silver funds gave 158 per cent in 2025, and by December every financial conversation seemed to end at silver. Anyone who acted on those conversations and bought in January or later is sitting on a loss today. Anyone who came in after January's 40 per cent monthly jump is down by roughly a third.

Gold went from 74 per cent to 6. Banking funds, the consensus favourite a year ago, have gone nowhere. And pharma and small

caps, the two categories most people had written off in 2025, now lead the domestic table.

International funds are the exception. They led the equity table in 2025 and lead it again this year. Two good years in a row do happen. Of the eight categories in our table, six flipped.

The July trap

Technology funds fell 22 per cent between February and June. In July they recovered 13.9 per cent, and because that bounce made them the month's best performers, the league tables and the headlines are once again full of technology

[FUND RADAR]

Last year's winners, this year's losers

The scoreboard reveals a telling story

 2025 winners	Returns (%)		 2025 losers	Returns (%)	
	2025	2026-YTD		2025	2026-YTD
 Commodities: Silver	158.1	-5.0	 Equity: Thematic-Factor based	-1.8	3.7
 Commodities: Gold	73.8	6.3	 Equity: Sectoral-Pharma	-2.9	16.4
 Equity: International	30.2	15.2	 Equity: Small Cap	-5.5	9.7
 Equity: Sectoral-Banking	18.9	-2.0	 Equity: Sectoral-Tech	-7.4	-13.2

Returns till July 31, 2026 considered. Categorisation as per Value Research classification.

funds. Some are asking whether you should ride the rally.

Step back a little. The category is down 13.2 per cent this year. Down 7.8 per cent over one year. Its three-year return, 5.5 per cent a year, is less than what a liquid fund gave over the same period.

A league table tells you what you should have bought. It never tells you what to buy.

The boring money won

Liquid funds have earned 3.5 per cent so far this year. In fact,

every debt category, from overnight funds to credit risk, has beaten large-cap funds over these seven months.

Should you move your equity money into liquid funds, then? No. Over 10 years, large-cap funds have compounded at 11.9 per cent a year and liquid funds at 6, and that gap is the reason anyone owns equity at all. The point is narrower. Seven months is a window small enough to produce any ranking it likes. This one put liquid funds above the Sensex heavyweights. The next

one will put something equally odd on top.

A first report card for SIFs

The new long-short SIFs got their first real test in the March quarter. Their sales pitch is that the ability to bet against shares softens a fall. Equity long-short SIFs fell 8.2 per cent while flexi-cap funds fell 13.1, so there was some softening. Hybrid long-short fell 3.7. The Ex-Top 100 variety fell 13 per cent, which is no softening at all.

For comparison, an ordinary balanced hybrid fund fell 6.5 per cent in the same quarter, with lower costs and far less complexity. Three quarters of history proves nothing either way. On the evidence so far, though, we would not pay extra for the short book.

For a detailed report on SIFs, check out our cover story of Mutual Fund Insight August 2026 edition.

One thing to do

Check your asset allocation once. The fall and the recovery may have moved it away from your plan. If so, rebalance and be done. The league tables will announce a fresh set of winners in December. You already know what happens to them.

Funds with a global slice

Starting a fresh SIP in an international fund has become unreliable. Here are the domestic funds that invest a portion abroad.

By Aakar Rastogi

Open the bonnet of Parag Parikh Flexi Cap, one of India's most popular funds, and you will find Alphabet, Meta, Amazon and Microsoft inside it, about a tenth of the fund in US shares. Edelweiss Technology holds Nvidia and Apple. None of these is an international fund. They are ordinary Indian funds that invest a slice abroad, and that slice just became more useful because the usual way to buy foreign equity has largely closed.

On July 23, Baroda BNP Paribas Aqua stopped taking new SIP registrations. It was the last international fund still open; the rest had already closed. India caps how much its funds can invest overseas, and one house after another has hit its limit. Some of the existing SIPs still carry on, but starting a new one had become impossible, until now.

From August 3, Baroda Aqua

Sakshi/AI-generated Image

reopens to fresh subscriptions, having freed up a little headroom, though it warns it may suspend again as the limit nears. So the door is ajar, not open, and only at one fund.

How to invest abroad now?

Three routes are left. A global exchange-traded fund, or ETF, on the exchange is quick but, as we

will see, expensive today. The Liberalised Remittance Scheme lets you send money overseas and buy foreign shares yourself, but brings extra tax hassles and paperwork. Or you can hold a diversified Indian fund that already invests a slice abroad.

We went through the June 2026 holdings of every equity and hybrid fund and pulled out the

Global ETFs: Where the premium stands

Global ETF	NAV (₹)	Price (₹)	Premium (%)	Average premium (%)	52-week details	
					Premium/(discount) range (%)	Average daily trading value (₹ cr)
Motilal Oswal NASDAQ 100	254.3	315.4	24.0	9.0	-3.0 to 27.7	23.6
Mirae Asset NYSE FANG+	154.8	191.3	23.6	19.8	11.8 to 30.1	5.4

Returns are for the whole fund, not the foreign part alone, as of July 29 2026. Holdings as of June 30, 2026.

diversified ones holding at least 10 per cent in foreign equity.

Read this carefully. That foreign slice is exactly that, a slice: at most a quarter of the fund, and for most 10 to 15 per cent, with the rest invested in India. These are not global funds in disguise, and the returns shown are for the whole fund, not the overseas part alone. Pick one only if the fund itself suits your plan. The foreign exposure is a bonus, not the sole reason to buy.

The ETF route, and why it is dear

If you would rather add foreign equity on purpose, a global ETF is the ready way, but mind the price. An ETF's market price can sit above the value of what it owns, its NAV; that gap is the premium. These ETFs stopped issuing fresh units in 2024, when they reached

their separate ceiling of \$1 billion, so supply is fixed while demand is not. With the dedicated funds now shut, that demand has fewer places to go, pushing the premium higher still.

And the two Nasdaq funds have run up fast. The Motilal Oswal NASDAQ 100 ETF traded barely 1 per cent above its NAV in March; it has climbed every month since, to 24 per cent now, and Nasdaq Q50 has done much the same. The other two US funds, FANG+ and the S&P 500, did not jump. They were already dear, near 18 to 20 per cent back in March.

All four US ETFs are now bunched between 22 and 24 per cent, and each trades above its own one-year average premium. The premium is the extra you pay over what the fund owns, and it does not stay put. You could see the effect in the

week ending on July 29, the NASDAQ 100 ETF's NAV, the value of what it owns, fell 7.0 per cent in rupee terms, but its exchange price fell only 2.5 per cent. The premium jumped from 18.3 to 24 per cent and hid most of the drop. Buyers did not dodge the fall. They just paid more for it. Similarly, it can also swing the other way.

So the closure changes less than it looks. Foreign equity is still within reach, inside funds you may already own and through ETFs for anyone who wants more. The real question is which route suits you, and whether the fund you are eyeing is worth buying at all. ☒

[COVER STORY]

How much of your
retirement
money
is actually yours?

By Pranit Mathur

Ravi Sinha is 51. This March, he spent six days outside an ICU in Gurugram while his mother recovered from a cardiac procedure. The bill came to ₹14 lakh. Insurance paid ₹6 lakh. The other ₹8 lakh came from the same mutual funds that Ravi had spent 10 years thinking of as his retirement money.

Have the same emergency happen to someone in Europe or the UK, and it barely makes a dent. Different health systems, different assumptions, and mostly, a retiree who only has to answer for himself. In India, it goes straight for the corpus.

Your retirement corpus is the total amount you set aside for old age. Eight months ago, we told you how fast you could safely spend it. We left out one question. In most Indian families, a good part of that sum is already promised to someone else, long before retirement day. Ravi's mother's medicines used to be a one-time expense. Now they are an ongoing one. The MBA his daughter wants to do costs ₹30 lakh over two years. Neither was on his spreadsheet, and both are happening.

Say you retire at 60, like Ravi, with ₹3.5 crore, and your household spends ₹1 lakh a month. That is 350 times your monthly expenses. We recommended that multiple in December. Draw 6 per cent a year, and our table said the money would see you through 35 years.

The table is not about whether your corpus survives 35 years. It tells you how many of those 35 years you

Your retirement comfort zone

How corpus size and withdrawal rate decide how many years you fall short

Withdrawal rate	Corpus as a multiple of monthly expenses					
	100x	200x	250x	300x	350x	400x
4%	35	35	35	0	0	0
6%	35	32	21	12	4	0
8%	35	27	21	17	13	10
10%	35	26	22	19	17	15

Assuming a 50:50 debt-equity portfolio earning 9.5 per cent per annum, over a 35-year retirement period. The 'real' income requirement has been adjusted for 5 per cent annual inflation. Impact of taxation has not been considered.

would fall short: years when what you can safely withdraw is less than what you actually need because your expenses would have grown with inflation and your withdrawal would not have kept pace. At 350 times your expenses, drawing 6 per cent, that is just four years.

Now assume ₹1.1 crore of that ₹3.5 crore is already set aside for commitments made before you stopped working. Your daughter's wedding. Your mother's care at home. The balance owed on a flat bought in your son's name. Take those away, and ₹2.4 crore is left: 240 times your monthly expenses, not 350. At 240, the same methodology says you fall short for 23 of your 35 retired years, not four.

The worries behind the corpus

Look at what readers write to us about, and at the common claims and their usual sizes

COVER STORY

You passed our test with a number that was never yours.

December's arithmetic still holds. The number we ran it on did not. An Indian retiree has one question to answer before any other: how much of this money have you already promised away?

So this issue makes three corrections. The base: what your multiple becomes once you take out the committed money. The shock: what one hospital bill does to a plan that looked funded. The horizon: why 35 years could be the wrong number for you.

The audit nobody runs

Ask an Indian investor aged 58 what his retirement corpus is, and he will give you a single figure. EPF, PPF, the equity funds, the fixed deposits, whatever he counts from property, all added up. One number. He thinks the whole of it is his.

In this country, a large share of the retirement corpus rarely belongs to the one who toiled to save it.

Some claims are written down: a home loan that runs past your retirement date, a loan against property to set up a family member's business. Most are not, and in an

Indian family, an unwritten promise gets collected as reliably as a bank's. A child's wedding. A parent who needs someone at home full time, or a room in a facility.

The correction itself is one line of arithmetic. Work out what share of your corpus is already promised away. Whatever is left over funds your own expenses, so it needs a higher multiple to do the job 350 was meant to do.

The multiple you need on your stated figure is 350 divided by one minus the committed share. Put a fifth of your corpus out of reach, and your target is no longer 350 times your monthly expenses. It is 438 times.

The correction rises faster than the commitment does. Go from nothing committed to a fifth committed, and your multiple climbs by 88. Going from a fifth to two-fifths adds another 200x. Guess your way through this audit, and you may be more mistaken than you realise.

Some of you ran our December numbers and felt reassured. If the figure you ran them on already included money you had promised away, that reassurance was not worth much. Redo the subtraction, then apply the same rule to what is left. The rule is fine. The number you fed it was not.

The question comes from Suraj Kaeley's *The Desi Retirement Plan*. His preparedness scorecard asks it in two parts: whether you have an honest picture of everyone who depends on you, and what you have already committed for your retirement.

The price of your promises

The required multiple climbs faster with each pledge

Share already committed	Corpus times monthly expenses		
	At 4% withdrawal	At 6% withdrawal	At 8% withdrawal
Nothing	 300x	 350x	 450x
10 per cent	 333x	 389x	 500x
20 per cent	 375x	 438x	 563x
30 per cent	 429x	 500x	 643x
40 per cent	 500x	 583x	 750x

Assuming a 50:50 debt-equity portfolio earning 9.5 per cent per annum, over a 35-year retirement period. The 'real' income requirement has been adjusted for 5 per cent annual inflation. Impact of taxation has not been considered.

The inevitable bill

Every simulation we ran in December assumed a clean run: thirty years of withdrawals with nothing interrupting them. But few Indian retirements run clean.

One cardiac admission, or a single course of cancer treatment in a metro private hospital, can cost ₹5 lakh to ₹25 lakh. While insurance may meet part of it, the rest comes out of your corpus, in a lump, on a date you did not choose.

Here is the part that surprises people. If you hold to a safe withdrawal rule, the bill does not empty your final corpus. Instead, it shrinks your income for years.

Take two identical retirees who face the same ₹15 lakh bill. One is billed in year three, the other in year 15. Everything else is identical, and both keep to the 6 per cent rule so the money lasts. Neither runs out. But look at what each gets to withdraw each year.

The retiree hit in year three draws less almost every year for the rest of retirement. Six per cent of a corpus

Equity

All three instruments playing in balanced harmony

Debt

A scheme that harmonises the portfolio by allocating between Equity, Debt and Gold & Silver Exchange Traded Funds (ETFs) like a finely tuned orchestra to navigate market rhythm and seek balanced growth opportunities.

Gold and Silver ETFs

CANARA ROBECO MULTI ASSET ALLOCATION FUND

(An open-ended scheme investing in Equity & Equity related instruments, debt & money market instruments, Gold ETFs and Silver ETFs.)

This product is suitable for investors who are seeking*:

- Long term capital appreciation
- Investments in equity and equity related instruments, debt and money market instruments, Gold ETFs, Silver ETFs, Units issued by InvITs.

*Investors should consult their financial advisers if in doubt about whether the product is suitable for them. The Scheme and Benchmark riskometer is evaluated on a monthly basis and the above riskometers are based on the evaluation of the portfolios for the month ended June 30, 2026.

For details, refer the Scheme Information Document (SID) of the Scheme available at www.canararobeco.com.

The bill that keeps taking

The safe rule protects the corpus but trims withdrawals

In ₹ lakh

Withdrawal each year at 6% of portfolio

● Scenario 1: Medical bill in year 3 ● Scenario 2: Medical bill in year 15

Assuming a Rs 1 crore starting corpus in a 50:50 debt-equity portfolio. Each year the corpus grows 9.5 per cent and 6 per cent of it is then withdrawn, so the income drawn rises and falls with the corpus. A one-off Rs 15 lakh medical bill is met from the corpus in year 3 in Scenario 1 and in year 15 in Scenario 2; everything else is identical. Figures are the yearly withdrawal in Rs lakh, rounded and shown every second year, before tax and before any insurance recovery.

that an early bill shrank is a smaller income. Early withdrawal also costs more years of compounding, so the corpus stays smaller for longer. The gap is widest in the years just after the bill and closes only near the end.

So the rule works, in the narrow sense: neither retiree runs out of money. It simply makes the earlier one live on less, for longer. The cost of a bill you cannot time may not always be a corpus that collapses. It can be the standard of living that never fully recovers, and the earlier the bill lands, the more years you spend below it.

Since you can't choose when the bill comes, the aim is not to brace the retirement corpus for it, but to keep the bill off that corpus altogether. Kaeley's answer comes in three layers.

First, a comprehensive health policy with a top-up above it, to meet the bill itself. Second, a medical corpus kept separate from your retirement corpus, invested for stability with a little growth. Third, a standing credit line or a high-limit card.

The third layer is the one people misread. It is not there to foot the bill. The credit line buys you two to four weeks, enough time to release the medical corpus in an orderly way, instead of selling equity into whatever the market is doing that fortnight. Think of the third week of March 2020, when forced sales meant a permanent loss; a credit line would have carried that bill to May.

Set up this way, the bill lands on money kept for it, and neither the retirement corpus nor the income it pays you takes the blow. That is the point: protect the retirement corpus by keeping the bill off it altogether.

The right number of years

Thirty-five years of retirement is an easy rule of thumb but it's not the same for everyone, and nobody knows their own number. Life expectancy shifts with your state, whether you live in a city or a village, your sex, your health and how you live. And the longer you have already lived, the longer you are expected to live still, so the average life quoted at birth understates the horizon a 60-year-old faces.

You cannot know your exact number, but you can see which group you fall in and plan for at least its average. That gives you a floor to work with.

Women in India have a higher life expectancy than men by about 2.3 years at age 60. So a woman retiring at

You will outlive the average

Life expectancy climbs with every year survived

95 years Expected age reached: ● Average ● Males ● Females

Source: Abridged Life Tables - 2020-24, www.censusindia.gov.in.

60 is planning a slightly longer retirement than a man the same age. There is a second problem. Women are far more likely to have stepped out of paid work to raise children or care for a parent during the best-earning stretch of their careers. So, they end up needing more money built from fewer years of income.

So if you are a woman sizing your own retirement, use a slightly higher multiple than a man would. If you and your husband are sizing a joint corpus, size it on the longer of your two lives, not on an average.

What still holds

Three findings from December remain unchanged and still determine most retirements.

Keep your annual withdrawal under 6 per cent of your portfolio. On ₹1 crore in a balanced 50-50 portfolio, withdrawing 5 per cent a year leaves about ₹4.7 crore after 35 years; 10 per cent leaves ₹70 lakh, or nothing, depending on when the bad years fall. Less in your sixties means more in your eighties, every year.

Hold a real equity share. Among retirees with long enough records to judge, the all-debt portfolio that felt safest produced the most years with discomfort. Debt did not protect them. It rationed them.

Rebalance once a year, whenever either side drifts more than 10 percentage points. It stops equity from building up before a fall you cannot afford at 70, and stops you from fleeing to deposits just as the recovery begins.

Three buckets of portfolio creation

Knowing your number does not tell you where to keep it. In retirement, the split matters as much as the size of the corpus, because the money has to last without rattling you every time the market falls 10 per cent. So divide it by when you will need it, not just by

equity against debt.

Bucket 1 - Emergencies and medical bills. Divide into three layers, in order. A health policy with a top-up above it, to meet the bill first. A liquid debt fund with a ring-fenced corpus for the portion insurance does not cover. And a credit card or a low-cost collateralised overdraft, to buy two to four weeks so you release the corpus in an orderly way instead of selling equity into a falling market.

Bucket 2 - Daily expenses. The next year of household spending, kept in a savings account and liquid debt funds. Same-day access, no fall in value on the morning you need the cash. It exists so you never have to sell a growth asset at the wrong time.

Bucket 3 - The long-term portfolio. The money you will spend in the latter half of your retired years, and what you leave to your family. A 50:50 equity-debt split, rebalanced once a year, with equity in flexi-cap or multi-cap funds and debt in a short-duration debt fund. This portfolio has to beat inflation over that stretch, and only equity offers that. If you hold it entirely in debt, you haven't removed risk. You have swapped a market fall for a shrinking lifestyle. We built the full case for this mix at length in December; check it out if you haven't.

Your retirement checklist

Everything so far has been about the number in the abstract: what to take out of it, what can dent it, how long it has to last, where to keep it. This is where it stops being ours and becomes yours. Give it a few quiet minutes, a pen, and the figures you actually have. This is an honest look at your own situation, best taken while there is still time to act on what you find.

First, on how this sum is built. It assumes a 35-year retirement, a 50:50 equity-debt portfolio earning

The honest retirement test

Fill it in and see if you are truly funded

Particulars	How you get it	Example	Your figure
1. The corpus you think of as retirement money	Write it in	₹2.5 crore	
2. Of that, the amount already promised to others	Write it in	₹50 lakh	
3. Your real number, free to spend	Line 1 minus line 2	₹2 crore	
4. Your monthly household expenses	Write it in	₹60,000	
5. The withdrawal rate you plan to draw	Write it in	6 per cent	
6. The multiple that rate needs	See visual 2	350x	
7. What you actually need	Line 4 times line 6	₹2.1 crore	
8. Your coverage score	Line 3 divided by line 7	0.95	

How to read line 8

Your coverage score	Where you stand	What to do
 1.20 and above	Funded	The plan survives most shocks without issues.
 1.00 to 1.19	Just funded	Offers some room for unprecedented shocks but needs monitoring.
 0.80 to 0.99	Slightly short	No room for shocks. Either reduce the withdrawal rate or try to reduce commitments.
 Below 0.80	Not funded	Corpus will not sustain lifestyle needs. Either reduce the withdrawal rate or try to reduce commitments.

Inspired by the 'Desi Retirement Preparedness Score' in Suraj Kaeley's 'The Desi Retirement Plan'.

9.5 per cent a year, no return on the money already promised away, inflation at 5 per cent a year, and withdrawals before tax. The 35 years is deliberately strict, because a strict yardstick is harder to fool. Shorten the horizon, and the corpus you need shrinks with it.

Most retirement questionnaires ask how prepared you feel. This one aims to skip feelings, and only care about what your numbers say. You already know four of them: the money you have, what you have promised away, your monthly expenses, and how fast you mean to draw. The tool calculates the other four and gives you a plain verdict: funded, short, or not funded at all.

The line that matters is line 3, your real number, what is genuinely yours once the promises are set aside. Everything after it simply holds that number against the rule. Fill it in.

The example (for your reference only) runs one household straight through. They retired with ₹2.5 crore and spend ₹60,000 a month and feel comfortable. Subtract the ₹50 lakh promised for a daughter's wedding and a parent's care, and their real number is ₹2 crore,

against the ₹2.1 crore they need. Read line 8: a coverage of 0.95. Now read what that score means.

Our example scored 0.95, so the verdict is slightly short: the corpus stands, but leaves no room for a shock, and the fix is to reduce the draw or trim a commitment.

Retire on what is left

A pension planned for one life doesn't survive a household that leans on it for three. A Western retirement calculator was never designed to ask this question because it was never designed for this kind of family.

Ravi's real number was never the ₹3.5 crore on his spreadsheet. It was ₹2.4 crore, the part that was actually his to spend. He found that out after a hospital bill forced the question on him. You get to find it out on your own terms, before any hospital forces the question on you.

Find your number. Subtract what you already owe. Plan only on what remains. Remember, that is not a smaller retirement. It is the only one that was ever actually yours. ☒

Up 8% when small caps were bleeding. How?

Invesco's Aditya Khemani on building a small-cap fund that holds up in bad times

When markets turn choppy, most small-cap funds feel it first and hardest. Aditya Khemani's doesn't. As Head of Equity at Invesco Mutual Fund, Khemani has built one of the best-performing small-cap funds in the country. And notably, a large part of that alpha came in the last two years, when the small-cap benchmark was down roughly 1.5 per cent while his fund was up close to 8 per cent.

With over 20 years of experience and a framework built around quality, risk management and bottom-up stock picking, he has shown that small cap need not mean reckless. In this conversation, he explains how he thinks about portfolio construction, position sizing, and manages valuation risk in a richly priced market.

We'd like to understand a little more about how your investing style has helped you navigate the last two years of volatile markets, and in turn generate the alpha that makes Invesco India Small Cap one of the top funds in its category. For context, since September 2024, the small-cap benchmark is down about 1.5 per cent, while your fund is up close to 8 per cent in that time. What are the two or three key decisions that led to close to 10 per cent outperformance in such a volatile market?

The first thing is the quality of the portfolio. We keep talking about risk management, and for us as fund managers, it's the most important thing apart from returns. If you make the quality of the portfolio good, it stands out in bad times — because in

good times, most portfolios do well, but it's in bad times that risk management really comes to the fore. So the first thing is maintaining a high quality of the portfolio.

Second, two and a half years ago, I decided that we should not be running a very small-market-cap fund. So we purposefully reduced exposure to stocks below ₹7,000–8,000 crore in our portfolio. Over the last 18 months, a lot of the pain has been in that part of the market, so staying away from the smaller-market-cap names has helped us. Today, less than \$1 billion market-cap names make up just 8–9 per cent of the portfolio.

Third — and this isn't specific to the small-cap fund — two and a half years back, after four to five years of a rally, a lot of spaces had become very expensive, and investors weren't differentiating between good and bad

businesses; everything was getting a high valuation. At that point, we reduced exposure to some of the very overheated sectors, including industrials. Most industrial companies two and a half years back were trading at 40–50 P/E — these are cyclical companies. So when even a slight bit of earnings or growth deterioration happened over the last two years, there was a knock in terms of the multiple investors were willing to pay. So navigating the overheated parts of the market slightly better also helped us.

These are things we want to do consistently, because small cap tends to be riskier than other parts of the market, so it's on us as fund managers to manage that risk. The common notion is that because you're taking the highest risk in small caps, the return expectation should also be high — but that hasn't proven true historically. If you look at the last 10 years, the small-cap index has given roughly 14–15 per cent CAGR, and mid caps have given about 17 per cent CAGR. So it's not the case that small cap will be the best-performing space just because you're taking more risk. That's why risk management becomes very important, especially when the market is overheated — and this has helped us not just in the small-cap fund, but across our funds, in navigating the last two years.

Investors generally expect a small-cap fund to have sector overweights and underweights that are much starker relative to the benchmark. When we looked at your fund, we found that over the last three years or so, you've been roughly 9 per cent underweight in Materials, and about 4 per cent overweight in Consumer Discretionary,

Performance snapshot

3 per cent in Technology, and about 2 per cent in Financials. What's your approach to constructing a small-cap portfolio, and how does that translate into these sector-level outcomes?

First, look at the benchmark. The small-cap index is actually a very poor construct for growth. Unlike most other benchmarks, where Financials is the largest sector, here it isn't — Industrials is the largest, with about a 19–20 per cent weight. Second, some sectors like Healthcare have a much higher weight in this index than in, say, the large-cap index, where Healthcare is only about 5 per cent. So the sector composition of the small- and mid-cap indices is very different, and a lot of these sectors are sectors of the future with much higher growth potential. That's my starting point — look at how the

index is constructed, then think about how you can do better.

For me, four sectors are critical for any portfolio I build: Financials, Consumption, Healthcare, and Industrials. Broadly, each of these would be 20–25 per cent of the portfolio, and the balance — 10–20 per cent — would come from allocations to sectors like Materials and Real Estate.

Within each sector, though, there are very different business models. Take Healthcare — the traditional part is pharma producers, which is what we've largely seen over the last 10–15 years, but there's also a services piece: hospitals and CDMOs (contract development and manufacturing organisations), which is the non-traditional side. We have much more exposure to hospitals and CDMOs. Within Consumption, we don't have too many traditional consumer staples companies — we have more exposure to quick commerce, and convenience is a theme we play. Aviation, even though it's classified as industrials, we look at as a consumption stock. Within Financials, banking might look homogeneous, but there are sub-sectors like capital market players — exchanges, wealth managers, asset management companies — and we've historically put more weight there than on the lending side.

So the construction within each sector is very different from how the index is built. Our strength has been more bottom-up stock picking. Sectors like Industrials and Healthcare are very heterogeneous, and even within Financials, non-banking models differ significantly from banking. We've taken a fairly non-traditional approach to portfolio construction rather than relying on what's worked over the last 10 years.

On Materials specifically — it's a

INTERVIEW

large sector in the small-cap index, around 15 per cent, and again very heterogeneous: cement, chemicals, fertiliser, oil and gas companies. We've chosen lower exposure there because we tend to favour companies that are more stable and less cyclical. A lot of companies within Materials have very volatile earnings — a metal company's earnings, for instance, depend heavily on metal prices, which are influenced by what's happening in China and government duty measures. We've chosen to avoid areas like that, which is why we're largely underweight in metals.

So sector by sector, we decide where we want to be overweight from a top-down view, and then make the call based on the bottom-up work we do on individual stocks.

When we do in-house performance attribution for funds, we usually find that winners and losers largely cancel out, with a few select stocks driving the real alpha. In your fund over the last three years, we found one financial-sector stock that's gone up roughly 10x, and a recently listed technology-sector company that's up three to four times in under a year. Both were big winners, but with seemingly different position-sizing strategies. What was your initial thesis on these picks, how much do you attribute to that thesis playing out versus luck, and how do you generally decide position sizing?

Position sizing is a function of several things. First, we look at the index construct — where a particular theme or sub-sector sits within the index, and what its weight is. That's the starting point, because at the end of the day any fund manager

wants to beat the benchmark, so you need to know clearly what you're targeting to beat.

Second, it's a function of your learnings — meeting people, meeting companies, understanding what's happening in the environment — which leads you to themes you like for the future. For example, hospitals is a theme we've played; financialisation is a theme we play; convenience is a big theme we're playing. You write down the themes you want to play, then look at which stocks within the index belong to that theme. Through a

“For a small-cap portfolio specifically, I mentally cap the largest single holding at around 5 per cent. I like taking a minimum of about 1.5 per cent in a stock.

process of elimination, you narrow that down — say, from eight stocks in a “financialisation” theme to two or three. Then, given the index weight for that theme, you decide how much you want to be overweight, and distribute that weight across the stocks you've chosen, based on valuation, management quality, and so on.

That's both an art and a science.

For example, CDMO was a space we were very positive on, and there was one company we liked far more than the others, so we gave it a disproportionate share of that allocation. Hospitals, on the other hand, had several good options across small, mid, and large caps, so that allocation got spread across multiple names.

For a small-cap portfolio specifically, I mentally cap the largest single holding at around 5 per cent, and while there's no hard floor, I like taking a minimum of about 1.5 per cent in a stock — below that, even if it does well, it won't meaningfully move the portfolio's return, so it's not worth holding. That's why it's a fairly tight portfolio — around 65 names today, but the bottom 15 names make up hardly 5 per cent of the portfolio. So about 50 names make up 90–95 per cent of it, and it's a carefully selected list built through top-down theme identification and bottom-up stock selection.

Some sectors are more heterogeneous than others — Pharma/Healthcare, Consumption, and Financials together make up about 60 per cent of the portfolio, and adding Industrials (16–17 per cent) takes it to about 80 per cent. Over the years we've also developed a framework around cyclicals — cyclical investing requires being a good trader in terms of entries and exits, which honestly isn't our strength, so we've chosen to largely avoid highly cyclical names and instead focus on more stable compounders. That's also helped us over the last two years.

As a style, we don't trade very often — we want to buy into a theme and stay with it unless the investment thesis breaks, whether that's at the sector, theme, or stock level. Beyond

that, valuation and relative attractiveness can prompt some changes, but it's a fairly dynamic process overall. That said, if you compared our fact sheet from six months ago to today, you wouldn't see too many changes.

Looking at the top holdings in your fund — or really any stock with more than 2 per cent allocation — most of them appear, at face value, richly valued, or you could say they have fairly high expectations priced in. What's your strategy for picking these high-growth stocks, and how do you manage the valuation risk, given that a missed guidance or execution delay could trigger a de-rating? And how do you decide when to enter and exit such stocks?

This is a question we could go on and on about, but let's start with what the risk actually is when you buy a stock. A one- or two-quarter miss is really a risk for a very short-term investor. When we look at companies, we don't focus too much on what's going to happen over the next year or two — there will be earnings misses, because companies operate in different circumstances, and it's not realistic to expect a perfectly linear trajectory. There have been so many disruptions over the last five, six, seven years — we're going through one right now too — so we try to be reasonable about what a company can realistically deliver, and we're fairly liberal in how we judge a company based on one quarter's results.

On picking companies — the small-cap space is very heterogeneous, and there are different approaches. One is to buy a niche company that dominates a small total addressable market — a

large fish in a small pond. The other is to buy a small fish in a large pond. I've always preferred the second, because a large fish in a small pond will eventually run out of growth, whereas a small fish in a large pond, if it executes well, can become much larger.

When we evaluate a business, we look at two things: the business itself, and the promoter and management. The best combination is a good business run by good people, and the weight you give a stock depends on how that combination, along with valuation, stacks up. Promoter and management quality matters enormously to us — a good top management can pivot even an

 **When we evaluate a business, we look at the business itself and the promoter and management. The best combination is a good business run by good people.**

average business into a good one over time. There's also a difference between the “zero-to-one” journey of a company and the “one-to-ten” journey — the skill set needed to scale up is very different from the skill set needed to start something, and in most cases, promoters alone can't manage that scale-up. You need good professional management, a strong second line, the right culture, and importantly, “fire in the belly.” A lot of these promoters are already worth ₹10,000–15,000 crore, and at that point it would be natural for them to want to take things easier — but our journey with the stock is only starting, so that hunger has to still be there.

That's why we never start with

valuation. If you look at a company trading at 50 times forward earnings, your mind immediately judges it as expensive. Instead, we first assess the business, management, and everything else on its own merit, decide what we think a fair price is, and only then look at the one-year forward P/E — and even that alone isn't sufficient. Because these are relatively small companies — ₹10,000–15,000 crore market cap — absolute market cap becomes an important lens: is this a small fish in a large pond that could become very large? Terminal value matters a lot for these companies, even though it's hard to know exactly what will happen five or ten years out. A lot of these companies' financials — working capital cycles, margins — aren't yet optimised, and as they scale, you'd expect those to improve. So looking only at one-year forward P/E doesn't do justice to all of that.

Ownership structure also matters — an owner-operator business needs a different lens than an owner-owned business run by professional management, or one backed by private equity. In a typical one-and-a-half-hour management meeting, an hour might go into assessing the second line of leadership — what they're doing, what's happening. One question we often ask is how many holidays the promoter takes in a year — if the promoter never takes a holiday, that suggests the company can't run without him; the more holidays he takes, the more it suggests the business can operate independently. There are a lot of nuances that go into this — investing can be as simple or as complicated as you make it. It's a fairly comprehensive assessment, rather than simply looking at a one- or two-year forward P/E and deciding whether to buy. 

What does it take to top the category?

The answer lies in a framework, a boiler room and building positions one quarter at a time

In 2025, all four of Nitin Gosar's equity funds at Bank of India Mutual Fund made it to the top quartile of their respective categories. That is not luck. Gosar joined the fund house in September 2022 after close to 12 years at Invesco, and has since built a research-driven process around a proprietary tool called the North Star strategy. Managing roughly ₹2,800 crore across four funds, his flagship Bank of India Multi Cap has compounded at close to 24 per cent since launch against the multi-cap benchmark's 18 per cent, and notably, nearly half that journey has been through a flat market.

In this conversation, he explains how the North Star works, what drove a sharp reversal in small-cap exposure in a single quarter and why sizing a position slowly is as important as picking the right stock.

How do you adapt as the market evolves? Take the Multi Cap Fund. It has lived

through two quite different markets. The first 18 months were a broad rally, and since September 2024 we've been in a flat-to-falling market for close to two years. Has that changed how you invest, or only what you own?

As the name suggests, it's a multi-cap fund. Typically, while creating the portfolio, especially in a multi-cap fund, you need to keep in mind the essence of large-cap, mid-cap and small-cap stocks.

Large-cap, we believe, is here to do a consolidation kind of activity, while mid- and small-cap are here to provide alpha-creation opportunities.

While identifying names in mid- and small-cap, we clearly keep in mind what the scenario is on a bottom-up basis and which ideas are coming through our research team. Thereafter, we put them through the badging process, where we clearly differentiate which companies our analyst team likes based on growth parameters and which companies are

there because of value parameters.

Then we have an overlay of where the macro cycle is. If the macro cycle indicates that interest rates or volatility are too high, then probably you want to stick with the safer names. If the broader environment is suggesting otherwise, then you have a differentiated approach.

Having said that, while preparing the multi-cap portfolio, we also have a North Star strategy, which is more proprietary to us. It's an in-house strategy where we evaluate large-cap valuation versus mid-cap and mid-cap valuation versus small-cap.

On those relative scales, every valuation parameter gives you a story or an indicative judgement about what you can pursue going forward. We have been following it to the principle, and so far you will see that within the portfolio there has been constant change over a period of a quarter or two, where large-cap exposure would have oscillated or decelerated. That's the programme, or the outcome, of

the North Star strategy that we have devised.

Let's get into the North Star framework. For viewers, can you de-jargonise it? Why is it called North Star, what goes in and what comes out? Does it produce a number? For example, one particular engineering and construction major has been part of your portfolio every month since launch, though below its earlier peak now. How did the framework get you into that position, and was the trimming driven by the framework or the price?

We have two pieces to it. When it comes to the cap-buy strategy, we use North Star to guide us. North Star is a guiding post. A guiding post will always indicate a direction rather than giving you a clear signal or a clear number.

When we are comparing the relative valuation framework, it comes down to the fund manager to decide where they are comfortable. For example, large-cap on an absolute basis could be cheap, while mid-cap and small-cap on an absolute basis could be slightly expensive. But when you look at the broader macro environment, if it suggests government activity is not going to slow down, then you still pursue the holdings, especially the mid-cap and small-cap holdings you have.

But if the larger framework is suggesting that the macro is slowing down, and to an extent where the relative valuation between large and mid has started to come down, and large-cap could be slightly more attractive versus mid-cap, that's where the alarm bell comes into play. Have we overdone it in terms of mid-

Performance snapshot

*Data till August 14, 2026 considered.

cap or small-cap? Do we need to book certain profits and come back to the safe havens of large-cap, and come back once the idea is much clearer?

That's the piece that we do for the cap-buy strategy.

When it comes to stock identification, we typically map the whole business into its economic cycle. The idea is just to help us look beyond immediate numbers. Once you gravitate towards the immediate numbers, then the whole thinking aligns with whether the company has outperformed or underperformed expectations.

We try to stretch it and say, look, the company is trying to do A, B and C, and with this A, B and C, it is trying to cover a chart for the next two, three or five years.

Every time the results come in, our whole emphasis and energy goes into whether the company is pursuing the trajectory that we had

previously marked while evaluating the name. If they are still pursuing it, we continue to back it.

Valuation does come into play, but at a later stage. That is how we do the charting and mapping.

Tell us about the research room when a stock actually gets bought. How many people are behind that decision?

The research room is always, internally, what we call a boiler room. There's always a fight going on, because these research people need to be given full freedom to investigate their ideas and use their subject expertise.

There are people who would have witnessed similar kinds of growth opportunities or challenges in their own sector, but with a different candidate. So, if an analyst is saying, "I like this idea," then another analyst would always have an opportunity to question whether the investigation is clearly covering all the aspects.

Apart from this, the whole discussion happens freely between the research analyst team and the fund-management team, so that every point gets covered. There are no unknowns which can pop up at a later point in time.

Once the framework is nicely decided and we like a company, then we clearly articulate what we are going to look for in this company once the results start to flow in.

If you keep it loose, every time the discussion will revolve around whether this company has done better than expectations. We don't want to keep it loose.

We say, look, when we identified this company, we were looking at probably the order book, market share or margin expansion. Are those things visible in the results that have

INTERVIEW

come so far? If not, are there indications that this can improve going forward?

Once those kinds of directional anecdotes are available, we continue with the journey. If not, then we have to revisit the whole investigation or the narratives because of which we had invested.

How many research analysts are sitting in that boiler room?

Today there are roughly 11 people who are part of the analysis team.

We ran your portfolio through our in-house performance attribution, looking at relatively high-conviction positions held for at least 12 months and with an average allocation of 1 per cent, to gauge what drove the outperformance. We saw quite a few names actually beat the index. What's more striking is where the value sits. Mid- and small-caps seem to have done a great deal of the work. Is the real skill here sizing at the mid- and small-cap end?

Actually, sizing plays a very important role, because many times when you start your journey with a mid- or small-cap name, we all agree that enough research and ground-level work has been done.

But even if one element gets missed, and the sizing is disproportionately high, it backfires.

So what we do is typically allow that sizing to develop over a period of time. The idea is not to jump-start with the maximum limits that are allowable, but to build it over a period of two to three quarters, so that you know what is changing and whether it

can give you the adequate returns that you had initially envisaged.

How much of that flexibility is possible because the fund is still around ₹1,200 crore?

Size does play an important role. Being smaller in size does give a lot of flexibility.

But, that said, we also have an internal framework where the team sits together and says, if it's a large-cap, then you can have something like index plus five. If it's a mid-cap, you can have index plus four. But if it's a small-cap, you can have a maximum of index plus three.

Once the size goes up, probably from ₹1,200 crore to maybe ₹10,000 crore, this challenge is still navigable. But I think once we become more sizeable, we will have to be much clearer about which are the no-go areas that we want to avoid.

Because even if we start nimble-footed and allow that position to build up, one casualty, or probably one event not playing out the way you want it to, can make liquidating those positions a challenge.

But that's something for the future to take care of, because right now we are still at ₹1,200 crore. Maybe a couple of years here and there, and we should be there.

At this size, what is currently

the minimum market cap of a small-cap stock that can enter your portfolio?

Internally, we have kept it very clear that anything upwards of ₹1,500 crore, we will investigate, and if it does make sense and sits within our research framework of quality and growth, then we'll take it further. If not, then we'll leave it there.

Something similar in the disclosures caught our eye. Through the second half of last year and into January, you were steadily building large-caps and running small-caps down to about 26 per cent, the lowest in the fund's history. Then, in a single quarter, you reversed it. By June, small-caps were back above 34 per cent and large-caps had come down to roughly the same level. What did you see in those 90 days that led to this change?

My starting point is always my research team.

At that point in time, when the fourth-quarter numbers started to come out, they were clearly giving a sense that whatever was thought could be the worst-case scenario was not shaping up the way the initial fear suggested. If one were to start mapping things in terms of growth

and valuation at that point in time, the valuation had already corrected, and there were more names that were coming through as the result period was shaping up.

It was a clear indication that things are not bad. It was an ideal time to start looking back at where the ideas can come from, and those ideas were largely coming from mid- and small-caps.

So it did make sense. For whatever precautionary reasons we had drifted towards large-cap, that's the only area we could pull back and rotate back into mid-cap and small-cap.

The research team always plays an important role. And if we have an overlay of the valuation framework we've been talking about, North Star or absolute valuation, both were indicating that versus six months back, we were really better off in terms of the entry point.

It may not be the best point, but it was better. So we just had to map up, or marry, the two: what analysts were seeing and where the North Star and absolute valuation table were.

Let's move to information technology. In your sector classification, it went from close to 8 per cent in late 2025 to about 2 per cent in the June portfolio disclosures, one of the sharpest sector moves you've made. What was the trigger, and what would bring you back?

Returns are generally made out of two elements. One is earnings growth, and the second is valuations.

Typically, in IT, there has been a long history of 20 years. If one were to look at the valuation curves and dividend yields from those PEs, they do stabilise at a point. Long-term history says roughly 13 to 15 P/E is a bare minimum P/E at which you can

start evaluating them. Probably a dividend yield of four-ish starts to look better versus the earlier dividend yields.

Those were the starting points when it came to the fundamental data suggesting that this is the space where you can build your positioning. Typically, when you are taking that kind of stance, you take it with large-cap names rather than mid-cap or small-cap names, because you are doing more macro work rather than bottom-up work.

But when the technology is changing, the third element comes into play: survivability.

For a brief period, the whole

 **Typically, in IT, there's a long history of about 20 years. If you look at the valuation curves and dividend yields for those P/Es, they stabilise at a point.**

narrative was questioning whether IT services companies from India can survive or not. If that is the question, and the hiring run rate from across the industry was also going down, it does give you a lot of doubt in terms of whether the past metrics or valuations would hold true for this instance as well.

That is where we thought, rather than being too judgemental about whether it will bounce back or not, we should immediately pare it off. Since there were other ideas available in the portfolio, especially on the macro-beneficiary side, we did go to those names.

But soon the AI narrative also started to dwindle. So we thought it was time to at least have a more measured position rather than being extreme on either side.

Let's talk about what the four funds you manage have in common. The Multi Cap Fund and Large & Mid Cap seem to have fairly high overlap, around 80 per cent of their holdings. The mandates are different, of course, because the Multi Cap Fund has to hold at least 25 per cent in small-caps, while the Large & Mid Cap Fund effectively does not. For an investor who owns both, what are they actually getting that is different?

If you see the essence of Large & Mid Cap, the whole proposition is to have a lower risk appetite versus the Multi Cap, because in the case of Large & Mid Cap, you may want to hold small-cap, but that is not your prime objective. It is more the evaluation process which is gravitated towards large-cap and mid-cap.

When I have ideas that come from my analyst team or the universe, and I do the badging process, they would look the same because they are the same large-cap names that you are comfortable with.

But when it comes to weight management, that is where things completely change, because your risk profile is certainly limited when it comes to Large & Mid Cap. You want to have more weight closer to large- and mid-cap, and very little in small-cap.

When it comes to Multi Cap, the portfolio could still be the same. But when it comes to oscillation, you are always oscillating in terms of trying to understand where the macro is, where the North Star is, where the ideas are coming from, and whether I can make it better from where I am today. 

When India sold IT, the giants held on

The funds with the most money haven't moved with the crowd

Indian IT has spent a year and a half falling. The Nifty IT index lost 41.5 per cent between December 2024 and July 2026, with close to two-thirds of that drop coming in 2026 alone. Fund managers moved with the tide: across 177 diversified equity funds, the average fund's IT holding shrank by about 40 per cent.

But the biggest funds, the ones holding most of India's equity money, behaved differently. What they did with it, and what it means for your portfolio, is worth understanding.

Why the market punished IT

The market has cut nearly 40 per cent off what it will pay for a rupee of Indian IT profit. Nifty IT traded at almost 28 times earnings in mid-January 2026 and under 17 by early July, even as the sector's earnings rose over those months. The fall was not a verdict on today's profits but on tomorrow's growth.

The worry is AI. Indian IT runs on billable hours, the more people working on a client's project, the more it earns. If AI tools let those clients do the same work with fewer of them, that revenue shrinks. It is a threat to future growth and whether it plays out is still contested.

The latest numbers show why the worry has teeth. The five stocks that make up the largest share of funds' IT holdings—Infosys, HCL Tech, TCS, Tech Mahindra and Coforge—reported June-quarter revenue up about 14 per cent in rupee terms.

Aprajita Anushree/AI-generated Image

The market stopped paying up

Nifty IT's multiple fell 39 per cent as the market de-rated the sector

Source: NSE Indices. Daily Nifty IT P/E from November 7, 2025 to June 26, 2026 are considered. Earnings per unit is calculated as Nifty IT Index value by Index P/E.

But the rupee had lost more than a tenth of its value against the dollar, which lifts rupee revenue on its own. Strip the currency out and the real growth was low single digits: Infosys 2.4 per cent, HCL 2.6, TCS 3.2. That is not what a 28-times valuation was built on.

What fund managers did

The typical (median) diversified fund held about 7 per cent of its portfolio in IT at the end of January 2026. As the sector fell, that dropped to 5.2 per cent by February and settled near 4.1 per cent by June.

The biggest funds behaved

Flattered by currency tailwinds

Strip out the weaker rupee and real growth was in low single digits

Revenue from operations as per June 2026 quarter against June 2025, from latest company filings. Constant-currency growth as disclosed by each company on its Q1 FY27 earnings call. Coforge is excluded since its quarter includes two months of Encora and it disclosed no year-on-year constant-currency figure. USD/INR averaged 94.62 over the quarter against 85.56 a year earlier.

Not everyone sold IT

The typical fund cut IT to 4.1 per cent; larger funds held more at 4.8

Median IT weight across 177 diversified equity funds against the same funds weighted by assets. Sector defined as the 60 BSE IT constituents classified as IT – Software.

differently. In the chart ‘Not everyone sold IT’, the AUM-weighted line or the average IT weight after giving each fund influence in proportion to its size, sits above the median line the whole way down. The gap means that the largest funds, which hold most of the industry’s money, carried more IT than the typical fund. By June, funds holding above-median IT accounted for about 57 per cent of the universe’s assets, up from 42 per cent last November.

But holding more is not the same as buying more and here the ‘What the weight doesn’t reveal’ table matters. Of the 10 largest funds, five

bought, four sold and one held no IT at all between January and June.

The lower June holdings don’t necessarily mean a fund sold. When a sector falls this hard, its weight drops on its own even if the manager does nothing. So the right way is to see if the weight falls as far as the price drop alone would take it. Take ICICI Prudential Value for example. Its 12.3 per cent IT holding should have slid to about 8.6 per cent in June on the roughly 30 per cent sectoral fall. Instead it sits at 9.4 per cent, which is only possible if the fund bought more. Five of the

10 funds show this pattern.

This is the crucial point. The industry’s falling IT weight was mostly a price effect, not a selling story. Most big funds did not dump IT, they simply watched it fall in value.

The buying, though, was lopsided. The 10 funds bought a net of ₹6,000 crore of IT, but almost all of it came from one fund, Parag Parikh Flexi Cap, the largest diversified scheme. It lifted its IT weight from 7 per cent in January to 8.9 per cent in June. So the honest reading is that the biggest funds refused to capitulate and one of them bought the dip hard.

What this means for the fund you own

The big funds’ refusal to sell tells you they are not as pessimistic about IT as the falling prices suggest. But it is not a green light for the sector either. The AI question remains unresolved.

As for investors, remember that a diversified fund is built to take exactly this kind of bet: buy into a beaten-down sector for its potential, while capping the danger through diversification. At an AUM-weighted 4.8 per cent in June, IT is not a large enough slice to sink a diversified

[SPECIAL REPORT]

What the weight doesn't reveal

Five of the 10 largest funds by assets bought IT stocks through the fall

Fund	AUM (as of June '26)	Jan '26 IT holdings	Jun '26 IT Holdings	Bought/sold (₹ crore)
Parag Parikh Flexi Cap	1,43,388	7.0	8.9	5,892
HDFC Flexi Cap	1,06,496	6.3	4.9	569
ICICI Prudential Value	60,198	12.3	9.4	434
Kotak Flexicap	55,850	7.1	3.6	-737
Nippon India Multi Cap	54,585	4.2	3.3	244
SBI Contra	47,362	5.4	3.4	-167
SBI Focused	47,274	0.0	0.0	0
Mirae Asset Large & Midcap	44,048	7.4	3.5	-738
SBI Large & Midcap	40,850	4.2	4.5	650
Kotak Large & Midcap	31,263	6.8	4.2	-146

Each fund's January weight is carried forward through the sector and market returns to show the weight it would have had in June if it had traded nothing, and the difference from its actual June weight is valued at June assets. Nifty IT fell 30.9 per cent between January and June 2026 and the Nifty 500 rose 2.2 per cent.

fund on its own, whichever way the sector turns.

But check your fund. If it carries far more than that, say, close to double, your manager is

taking a bigger IT bet than most peers. That is not wrong but it should be a deliberate choice, not a surprise. If it is more risk than you signed up for, the answer is

not to sell in a panic. It is to hold that fund alongside one whose manager reads IT differently, so no single view decides your outcome.

When a mutual fund investor dies

Here's what families need to know

Sakshi/AI-generated Image

By Aakar Rastogi

Thousands of Indian families find that inheriting mutual fund money is harder than earning it. The folios sit across four or five AMCs with different paperwork, and one spelling gap between death certificate and folio can stall a claim for months.

On July 17, at SEBI's direction, AMFI eased claiming units after a holder's death. The three most common snags now have fixes: AMCs accept the latest recorded address, a name gap clears with a self-certified Aadhaar or passport, and a signature gap gets a graded check, not a flat rejection.

What every living investor should do first

Register nominations: every single-holder folio must carry a nominee or an opt-out. With one it transmits in days; without, months, or a court order. Update after marriage, divorce or death, and keep your name identical across PAN, Aadhaar and folios.

Who actually gets the money

A nominee is not the owner. The nominee holds the units in trust for the legal heirs. If there is a will, it decides. If not, succession law does. Usually this never matters, because the nominee and the heir are the same person, typically the spouse. But if one child is the nominee and another is named in the will, the AMC pays the nominee and the family's legal position is a separate matter.

Joint holdings work differently. When one holder dies, the units pass to the survivor. Nomination in a joint folio matters only after all holders are gone.

The claim, step by step

Find everything. Get the deceased's consolidated statement from CAMS, KFinTech or MFCentral. Check email for fund statements and the AIS for transactions. Families routinely miss folios, and India's pile of unclaimed fund money keeps growing because of it.

Inform the fund house. On intimation of death, all folios where the deceased was first holder get stop-marked

against transactions, PAN-wide. Stop the SIPs too, since the bank account will be frozen anyway.

Identify your scenario. A surviving joint holder needs only the transmission form, death certificate and KYC. A registered nominee needs the same plus bank details, with the signature attested by a bank manager for claims up to ₹5 lakh and by a notary or magistrate above that.

No nominee and no joint holder is the hard path. Up to ₹5 lakh, legal heirs can claim with an indemnity bond signed by all heirs, affidavits, proof of relationship and bank-attested signatures. Between ₹5 lakh and ₹10 lakh, the same route with notarised attestation. Above ₹10 lakh, there is no shortcut: you need a succession certificate, a probated will or a letter of administration from a court. This is exactly the scenario nomination exists to prevent.

Submit and follow up. CAMS and KFinTech handle most fund houses between them, so one visit can cover several AMCs. The fund house sends an intimation to the deceased's registered address as a fraud check, and a cooling-off period of about 10 business days applies before redemption is allowed.

After transmission, register a fresh nomination immediately.

The tax position

Transmission is not a taxable event. The claimant inherits the units with the original cost and holding period. Tax arises only on redemption, computed as it would have been for the original investor. So there is no tax reason to redeem in a hurry. Decide on merit: does the fund fit your own portfolio or not?

Do this today

If you are still investing, check every folio names the right nominees and your family knows where the list is. If you are the claimant, go in order: death certificate, folio list, your scenario, the right documents, then file through the RTA and follow up in writing. The rules are now on your side – use them. ☒

SHYAMALI BASU

Your retirement corpus

There is no universal number. Here is how to work out yours.

Retirement planning often sparks debates about the “ideal” corpus. Some say ₹10 crore, others insist on ₹40 crore, a few suggest ₹100 crore or more.

The truth is, there is no universal number. The right corpus depends on your lifestyle, spending and financial responsibilities. More than inflation alone, it is your standard of living and future aspirations that decide how much you will need.

Start with your expenses

The simplest way to estimate your corpus is to start from what you spend today.

List your regular monthly expenses, such as groceries, utilities, domestic help, transport, fuel and entertainment. Then remove the costs that will stop by retirement, such as children's education or home loan EMIs. What remains is the spending needed to maintain your current lifestyle. For the household in the table, that is ₹1.4 lakh a month, or ₹16.8 lakh a year.

Your lifestyle may also improve as your income rises, so factor in any likely increase before you finalise the estimate.

Account for inflation

Convert that annual figure and project it to your retirement year using an inflation assumption. A 6 per cent rate is a sensible starting point, close to the RBI's long-term target. Go higher if you expect expenses to rise faster; a lower rate risks underestimating your needs.

The right retirement corpus depends on your lifestyle, spending and financial responsibilities

Medical and education inflation often runs much higher, between 10 and 15 per cent. Education is usually a separate goal, but healthcare costs stay relevant after retirement. Health insurance reduces this burden, though it cannot remove it entirely.

Estimating the corpus

Take the household above, with ₹16.8 lakh a year in continuing expenses. Adjusted for 6 per cent inflation over 20 years, that grows to about ₹54 lakh a year.

Now apply the widely accepted 4 per cent withdrawal rule: drawing 4 per cent a year means your corpus must be 25 times your

What carries into retirement

Drop the expenses that end at retirement. Here, that leaves ₹1.4 lakh a month.

Monthly expense	Amount (₹)	Counts towards retirement?
Groceries	30,000	Yes
Domestic help (maids, drivers)	60,000	Yes
Entertainment	20,000	Yes
Gifts and grooming	10,000	Yes
Fuel	20,000	Yes
School bus	6,000	No

Illustration: Anand Kumar

annual spending. So ₹54 lakh a year calls for a corpus of around ₹13.5 crore.

This is an estimate, not a guarantee. If you expect your lifestyle to improve or want a larger cushion, aim a little higher.

How do you build it?

Assuming your investments earn 12 per cent a year, building ₹13.5 crore over 20 years takes roughly ₹1.4 to 1.5 lakh a month. Existing retirement and fixed-income savings reduce that, though they may also lower your blended return. And because inflation erodes cash, the money needs to sit in assets that outpace it, mainly equities, with gold as a diversifier.

The takeaway

A retirement corpus is not a number borrowed from social media or someone else's financial plan. It is a figure built around your own expenses, lifestyle and goals.

The calculations will change as your income, spending and priorities evolve. What matters is not a perfect number today, but reviewing the plan regularly and investing more as your earnings grow. A realistic plan, updated over time, beats chasing a one-size-fits-all target. ☒

Beyond broad indices

How quantitative factor rules can improve portfolio design

Every index carries a judgement about what deserves weight. In the Nifty 500, market capitalisation supplies most of that judgement. A company that becomes larger commands more capital, irrespective of whether the rise reflects stronger fundamentals or simply a richer market price. The index provides broad coverage while leaving a separate question unresolved: which characteristics deserve more capital?

A broad universe is only the starting point

Factor rules begin at that question. From the same Nifty 500 universe, a different rulebook can produce a portfolio whose behaviour diverges sharply from the parent index. A momentum rule may favour persistent relative strength, whereas quality rules can remove financially weaker companies. Value changes the entry criterion by asking whether the price leaves enough room for the fundamentals. Low-volatility rules pursue a different risk profile.

The table 'Factor rules changed the long-term return profile' resists a league-table reading. Momentum rewarded investors more at the median while demanding greater tolerance when conditions turned. Low volatility protected weak periods more effectively.

Factor rules therefore change the distribution of outcomes within the same market, which makes the relevant question whether the resulting trade-off suits the role that the strategy must play in a portfolio.

Factor rules changed long-term return profile

Even the worst-performing passive factor index outperformed the broader-market passive index

Index	Median 5Y rolling return (% pa)	% instances of outperforming Nifty 500 over 5 years	Annualised Sharpe ratio (%)	Min. return over 5 years (% pa)
Quality	16.6	76.1	0.55	-0.6
Value	14.6	58.6	0.43	-8.1
Momentum	21.7	97.3	0.63	-4.4
Low Volatility	16.0	83.4	0.56	2.8
Multifactor	19.1	94.2	0.65	1.7
Nifty 500 TRI	13.5	-	0.40	-1.4

Source: NSE. Factors refer to Nifty 500 (Value 50 TRI, Momentum 50 TRI, Low Volatility 50 TRI, Quality 50 TRI, Multifactor MQVLv 50 TRI). Five-year rolling returns are annualised returns calculated for every overlapping 60-month period using monthly index values from April 2005 to July 2026. The percentage of instances outperforming the Nifty 500 TRI represents the proportion of five-year rolling periods in which the respective index delivered a higher annualised return than the Nifty 500 TRI. Past performance may or may not be sustained in the future.

Rule-based investing also moves judgement earlier in the process. Researchers define the factor before trading begins and decide when the portfolio will rebalance. Discipline follows when the strategy continues to obey those tested rules through uncomfortable markets.

Market capitalisation does much of the work in a broad index. A passive factor index shifts some authority to a published rulebook. Once an investor chooses that index, the index's methodology continues to determine which stocks qualify until the provider revises the rules.

A wider rulebook, more portfolio choices

The three approaches differ mainly in where investment judgement enters

Criterion	Passive broad-market index	Passive factor index	Active factor fund
Starting point	Broad market index	Broad or defined parent universe	Universe defined by the scheme mandate
Stock selection	Index eligibility rules	Published factor methodology	Factor rules plus additional investment filters
Where judgement enters	Index construction	Choice and design of factor	Factor design, eligibility filters and portfolio rules
Portfolio weights	Typically free-float market-cap weighted	Determined by the factor index methodology	Determined by the fund's rule-based methodology
Ability to refine the process	Depends on changes made by the index provider	Depends on changes to the factor index methodology	Rules can evolve through research, subject to the scheme mandate and governance process
Main source of differentiation	Broad market exposure	Deliberate factor tilt	Factor exposure shaped by additional portfolio rules
Key trade-off	Can inherit market concentration	Factor cyclicalities create tracking error	Additional rules introduce model and implementation risk

The real difference lies in how the rules work

A broad-market index largely accepts the portfolio created by the index methodology. A passive factor index makes a more deliberate choice: it tracks an index built to favour a specified factor. The investor therefore accepts both the factor view and the index provider's method of expressing it.

An active factor fund has another layer available. Other rules can determine which companies are eligible before the factor is applied, or govern how the resulting portfolio takes risk. This gives the process more room to distinguish between a stock that scores well on a factor and one that the model considers suitable to own.

That distinction is central to NJ's approach. The process starts from a broad universe and applies a baseline quality filter before the chosen factor enters the picture. For the momentum strategy, companies that fail the prescribed forensic and governance tests are removed. Similarly, stocks displaying high volatility are screened out. Factors like momentum and value then operate within the remaining universe.

That sequence matters. A stock cannot enter merely because its price has risen strongly or it is trading at a reasonable discount. It must first

survive the conditions that the investment process places around the factor.

Such freedom carries its own risk. Each additional rule rests on a research judgement and can fail to improve the portfolio. An active factor fund therefore deserves no automatic presumption of superiority over a passive factor index. The extra rules have to justify themselves through the outcomes they produce over time.

Whatever floats your boat

Broad-market indices remain useful because they give investors extensive market exposure through a simple rulebook. Factor indices make a further choice about which characteristics should receive more weight. Active factor funds can subject those characteristics to additional tests before capital is committed.

Each step places more responsibility on the rules behind the portfolio. That raises the standard by which the strategy should be judged. A useful rule must have a sound rationale and survive market conditions that do not flatter it. Over time, the relevant question is whether those additional rules earn their place. ☑

A useful rule must have a sound rationale and survive market conditions that do not flatter it

[THE PLAN]

The last big tax break

The new tax regime kept one deduction worth finding. Here it is.

By Aakar Rastogi

Rohan Deshpande is 37, and by most measures he is doing everything right. A senior product manager at an IT services company in Pune, he has an annual salary of around ₹28 lakh, runs a steady equity SIP, keeps an emergency fund and has a growing EPF balance building in the background. He files taxes under the new tax regime.

And every year, when he files his return, the same thing nags at him.

The new regime has taken away almost everything he grew up hearing about – Section 80C, house rent allowance, and the health-insurance premium. Line after line that once trimmed his tax bill now reads nil. After filing this year, he came to us with a simple question: is there a deduction left that actually makes a difference for someone salaried like him? Or has he run out of options?

There is one. But it is not where most people on the new regime think to look, and it has to be set up during the year, not found at filing time.

The deductions the new regime kept

The new regime removed almost every deduction

Sakshi/AI-generated Image

Equity funds ₹40,000 / m | Tax regime **New**

His immediate priority

A deduction that survives the new regime and actually moves his tax bill

The higher your basic salary, the more you can save

At a ₹12 lakh basic, the jump from 10 to 14 per cent saves an extra ₹14,400

In ₹

Basic pay plus DA	Deduction at 10 per cent	Deduction at 14 per cent	Extra deduction	Extra tax saved at 30 per cent
6,00,000	60,000	84,000	24,000	7,200
9,00,000	90,000	1,26,000	36,000	10,800
12,00,000	1,20,000	1,68,000	48,000	14,400
18,00,000	1,80,000	2,52,000	72,000	21,600
24,00,000	2,40,000	3,36,000	96,000	28,800

Figures exclude the 4 per cent cess. The 10 per cent and 14 per cent figures are the employer's NPS contribution as a share of basic pay plus DA.

salaried taxpayers relied on. Two survived. One is the ₹75,000 standard deduction, which applies automatically and needs no thought. The other is the employer's contribution to the National Pension System (NPS), and that is the one worth Rohan's attention.

Here is how it works. If his salary is structured for it, Rohan's employer can route up to 14 per cent of his basic pay plus dearness allowance (DA) straight into his NPS Tier I account. Instead of paying him that slice as salary and taxing it, the employer deposits it directly into his retirement account.

The first thing Rohan should do is check one line in his last Form 16. If his employer already contributes, the deduction will show up there, and he can claim it in full. If it does not appear, no entry on the return can create it – the deduction covers only what the employer actually paid in during the year.

Why 14 per cent, and what it saves

Private-sector employees like Rohan used to get this benefit only up to 10 per cent of basic pay plus DA. The Finance (No. 2) Act, 2024 raised the cap to 14 per cent, bringing them in line with government employees. The higher limit applies only under the new regime; in the old regime, the private-sector cap stays at 10 per cent.

On his ₹12 lakh of basic pay plus DA, 10 per cent would let his employer route ₹1.2 lakh into NPS tax-free; 14 per cent lifts that to ₹1.68 lakh. The extra ₹48,000 of deduction saves ₹14,400 a year at the 30 per cent slab, about ₹15,000 once cess is added.

The deduction also stretches the zero-tax line. The Section 87A rebate makes income up to ₹12 lakh tax-free under the new regime, and the standard deduction lifts that to a salary of ₹12.75 lakh.

Every rupee routed into NPS raises that threshold by the same rupee, because it leaves taxable salary before the rebate is worked out. That matters less to Rohan at his income, but for colleagues nearer the threshold it can be the difference between paying tax and paying none.

The honest trade-off

This is not free money, and Rohan should go in clear-eyed. In most companies the employer's NPS contribution is carved out of the existing cost-to-company, not added on top. His monthly take-home will fall by the amount that goes into NPS. What he buys with that dip is a tax-free transfer into his own

The old regime still short-changes you

Private-sector employees get the full 14 per cent only on the new regime; the old one caps them at 10

Tax regime	Govt. employees (%)	Private-sector employees (%)
New regime	14	14
Old regime	14	10

Cap as a share of basic pay plus dearness allowance. Source: Finance (No. 2) Act 2024.

retirement account, growing at market returns, at the cost of liquidity.

The lock-in is real. NPS Tier I money generally stays invested until he turns 60, save for limited partial withdrawals. At retirement, up to 60 per cent of the corpus can be taken tax-free, while at least 20 per cent must buy an annuity, whose payouts are taxed as income. For a disciplined saver who would have invested the money anyway, and who does not expect to need it before 60, this is close to a free lunch – exactly Rohan's situation. Someone who needs every rupee of take-home, or who may need the money sooner, should think harder before signing up for the full 14 per cent.

The ceiling that bites only at the top

Total employer contributions to NPS, EPF, and superannuation are capped at ₹7.5 lakh per year. Anything above that is taxed as a perquisite in your hands, along with the returns earned on the excess. With EPF at 12 per cent of basic and NPS at 14 per cent, the ceiling starts to bite at a basic pay of roughly ₹29 lakh a year. Below that, the full 14 per cent flows through untaxed.

What Rohan should do next

If his employer already contributes to his NPS account, he should check his payslip to see how much, and whether it is the full 14 per cent. If nothing is going in, one conversation with HR settles it: does the company offer a corporate NPS arrangement, and can his salary be restructured to route up to 14 per cent of basic pay plus DA into it? Registration is a one-time exercise on the employer's side, and the change shows up in his very next pay cycle.

For anyone on the new regime, this is one of the last real ways to cut taxable income and build a retirement corpus at the same time. Easy to overlook, and well worth checking before you file your next ITR.

ADVISOR

For expert guidance

Portfolio construction

My long-term portfolio has two flexi-cap funds, two mid-cap funds, one small-cap fund and one multi-cap fund, all from different fund houses. After investing for the last 10 years, I want to restructure my portfolio. Is this okay?

- Vedantham Krishnan

Your portfolio is already well diversified. With funds across flexi-cap, mid-cap, small-cap and multi-cap categories, and across fund houses, you have exposure to the full market-cap spectrum. Even if your flexi-cap funds carry a large-cap bias, the other categories cover mid- and small-cap stocks well.

So there is no need to restructure simply because you have completed 10 years. Instead, review each fund on its own merit: does it add meaningful diversification, and can it still deliver alpha?

Also keep an eye on your asset allocation. A strong run in one category can pull it away from your target, and periodic rebalancing brings it back to a risk level you are comfortable with.

Long-short strategies

I am retired but comfortable with a moderate risk appetite. Can I invest in long-short funds instead of aggressive hybrid funds?

- Muthukrishnan Rengarajulu

Long-short funds can potentially reduce the impact of market falls by combining long positions with short positions. However, they are not a direct substitute for aggressive hybrid funds, especially for retirees.

Aggressive hybrid funds typically invest 65-80 per cent in equities and the rest in debt, offering a relatively straightforward balance between growth and stability. Long-short funds, on the other hand, use more complex strategies that depend on both rising and falling stock prices. Their returns can vary based on how effectively these strategies are executed.

Long-short funds can potentially reduce the impact of market falls by combining long positions with short positions

Across a full rate cycle, short duration funds capture most of the return of longer-dated funds with far less volatility

As a retiree with a moderate risk appetite, your priority should be preserving capital while generating reasonable long-term growth. Aggressive hybrid funds are generally better suited to this objective because they are simpler, more predictable and easier to understand.

If you are interested in long-short funds, consider allocating only a small portion of your portfolio to them, while keeping the bulk of your investments in well-diversified core funds.

Duration trade-off

If liquid funds are meant for periods of up to 90 days and short-duration funds for one to three years, why are liquid funds giving higher returns? Wouldn't it be better to use liquid funds even for longer periods?

- George Varkey

It is easy to read a recent snapshot as though it were a permanent rule, but the picture turns with the rate cycle. A debt fund earns in two ways: the interest it accrues, and the movement in its bond prices when rates change. The prices of existing bonds fall when rates rise and rise when rates fall, and the longer a fund's duration, the sharper that swing.

Liquid funds hold bonds maturing within about 90 days, so they carry almost no duration. That is why they look better right now: yields have risen, pulling down the prices of longer-dated bonds, and liquid funds stay largely shielded from that fall. But if the RBI cuts rates, liquid funds must reinvest their maturing bonds at the lower rate, and their yield drops quickly. Short-duration funds, which keep a portfolio duration of one to three years, lock in today's yields for longer and gain as bond prices rise.

This is why we at Value Research prefer short-duration funds for a steady debt allocation. Across a full rate cycle, they capture most of the return of longer-dated funds with far less volatility, and hold up better than liquid funds once rates begin to fall.

Retirees still need equity

Should retirees avoid equity altogether?

Not really. The biggest reason is inflation. Let's take a simple example. Suppose your monthly expenses are ₹25,000, which means you need ₹3 lakh a year to maintain your lifestyle. Next year, ₹3 lakh will almost certainly not be enough because the cost of living rises over time. Some expenses may increase sharply, some may fall and some entirely new expenses may emerge. That's simply how inflation works. When you

retire, your mindset also changes. Without a regular salary, people naturally become more cautious and gravitate towards fixed-income

investments because they appear safe. But that's precisely why some equity exposure remains essential. A retirement portfolio invested entirely in fixed income is vulnerable to inflation. While fixed-income investments may earn around 6-7 per cent annually, inflation steadily erodes purchasing power.

Trying to earn higher returns by taking additional credit risk in fixed-income products isn't the answer either. Chasing 10 or 11 per cent returns through risky bonds puts your principal at risk, defeating the purpose of fixed income. The role of fixed income in retirement is capital protection and income stability. The role of equity is different. It helps preserve the long-term purchasing power of your savings. Without some equity exposure, there is a real danger of outliving your retirement corpus.

SIP beats market timing

Is buying the dip really smarter than an SIP?

This is a difficult debate to settle because

Without a regular salary, people naturally become more cautious and gravitate towards fixed-income investments

Watch video

Instead of trying to predict markets, investors are far better off focusing on things they can actually control

Watch video

the urge to time the market is deeply ingrained in all of us. For over 35 years, one of the most common questions investors have asked is: "Is this the right time to buy?" closely followed by "Is this the right time to sell?"

People naturally believe there is a perfect moment to invest and a perfect moment to exit. But successful market timing assumes two things. First, you always have cash waiting to be deployed. Second, you'll recognise the perfect buying opportunity when it arrives.

The problem is that the best buying opportunities are usually the most frightening.

When markets fall sharply, investors rarely think they've reached the bottom. They expect markets to fall even further. Trying to catch the exact bottom is extraordinarily difficult. Even professional fund managers managing dynamic asset allocation strategies have struggled to do it consistently.

There's another practical problem. Suppose you've already built a portfolio worth ₹10 lakh and are trying to perfectly time your next ₹10,000 investment. Even if you succeed, the impact on your overall wealth is minimal.

If market timing really worked consistently, the logical step would be to time the exit of the entire ₹10 lakh portfolio as well, something virtually no investor is able to do successfully.

Instead of trying to predict markets, investors are far better off focusing on things they can actually control: their financial goals, how long they can stay invested and how regularly they invest. ✓

Higher returns, bumpier ride

Nifty Healthcare and Nifty 500 took turns leading, with Healthcare offering higher returns but more volatility

Five-year rolling returns calculated monthly from January 2011 to July 2026; Total Return Index (TRI) used.

How healthcare fared in downturns

Nifty Healthcare generally saw lower declines than Nifty 500 during major market corrections

Periods when Nifty 500 TRI fell 15 per cent or more from its peak since 2006; Total Return Index (TRI) used.

Investor takeaway

Nifty Healthcare offers focused exposure to India's healthcare sector, covering pharmaceuticals, hospitals and other healthcare businesses. It has delivered higher average five-year rolling returns than Nifty 500, but with greater volatility and long stretches of underperformance. Healthcare has also

generally seen smaller declines during major market corrections. However, the index is concentrated in a few large constituents, making it more dependent on the performance of select stocks. Investors should therefore view it as a satellite allocation to complement a diversified core portfolio, rather than a replacement for broad-based indices or funds.

Two routes to the Nifty 50

M-cap vs equal weight: Two ways to own India's top 50

Two indices can own exactly the same 50 stocks and still hand investors very different returns. Over the past year, one of them lost money while the other gained more than 8 per cent, without a single stock to tell them apart. The difference is not in what they own. It is in how much of each they own.

The Nifty 50 and the Nifty 50 Equal Weight are the cleanest examples of this in the Indian market. Same 50 companies, same reconstitution schedule, same universe, yet different in a crucial way. The table titled "Same cast, different roles" below highlights what sets them apart.

The different weighting rules result in very different portfolio concentration. While the Nifty 50 is dominated by a handful of heavyweight stocks, the Equal Weight Index spreads exposure almost evenly across all 50 constituents. This is evident in the visual titled "The top 10 steal the show".

The top 10 stocks account for

The top 10 steal the show

Nifty 50 loads up on the top 10; Equal Weight spreads it flat

Based on average weights over the past three years ending June 30, 2026.

more than half of the Nifty 50, while the bottom 10 together contribute less than 7 per cent. In contrast, every group of 10 stocks contributes roughly one-fifth of the Equal Weight index.

Weights shape returns

As of July 24, 2026, the Nifty 50 delivered a one-year return of -2.3 per cent, while the Equal Weight

index returned 8.2 per cent. Over the last three years, the gap was equally notable: 6.7 per cent per annum for the Nifty 50 versus 14.0 per cent for the Equal Weight index.

This difference is purely the result of how much importance each stock receives in the portfolio.

To understand this better, we analysed the 43 stocks that remained part of the Nifty 50 throughout the last three years. These stocks were grouped into four quartiles based on their three-year returns, and we compared their average weights in both indices.

The Equal Weight index allocated more to the best-performing group of stocks and relatively less to the weakest performers. The Nifty 50, meanwhile, had a much larger allocation to the weakest-returning quartile because several heavyweight constituents underperformed during this period. The lesson is straightforward: when the largest companies struggle while

Same cast, different roles

How weighting makes the same 50 stocks look very different

Parameter	Nifty 50	Nifty 50 Equal Weight
Weighting methodology	Free-float market capitalisation	Equal weight (around 2% per stock at each rebalance)
Highest/Lowest weight (%)	10.4/0.4	2.1/1.9
Concentration (Top 5/Top 10)	37.6/53.4	10.4/20.6
Top 3 industries (Weight in %)	Banks (27.1%), Software & IT Services (12.6%) and Oil & Gas (10.5%)	Automobile (11.5%), Software & IT Services (11.1%) and Banks (10.7%)

Data as of June 30, 2026.

the rest of the market performs well, the Equal Weight index has an advantage because it relies less on a handful of heavyweights.

Recent performance, however, tells only part of the story. When the heavyweights are the ones doing the work, the same arithmetic runs in reverse.

That is exactly what happened between January 2017 and January 2020. During this three-year period, the Nifty 50 TRI delivered an annualised return of 15.7 per cent, compared with 8.2 per cent for the Nifty 50 Equal Weight TRI.

The reason was simple. Among the 40 stocks that remained in the index throughout the period, the top 10 stocks (by weight) generated an average annualised return of 24.2 per cent, while the remaining 30 stocks returned just 3.9 per cent. With the Nifty 50 assigning much higher weights to these outperforming heavyweights, it comfortably outpaced its Equal Weight counterpart.

So neither index remains the winner all the time. Their relative performance depends on where market leadership lies.

What the long record says

Neither run tells you much on its own. The five-year rolling return series does more work, because it asks the

question an actual investor faces: what happened to money left in each index across every possible five-year stretch? The visual titled “The lead keeps changing hands” compares the five-year rolling returns of the two indices since 2011.

Although the Equal Weight index has outperformed over the last few years, it has not consistently stayed ahead.

Over the last 15 years, the Nifty 50 outperformed in 58 per cent of five-year rolling periods, while the Equal Weight index led in 42 per cent. More importantly, their average five-year rolling returns have been almost identical 12.1 per cent for the Nifty 50 and 12.3 per cent for the Equal Weight index. Despite taking different paths, both indices have delivered quite similar long-term outcomes.

So, which one should you choose?

If recent returns are the only consideration, the Equal Weight index may seem like the obvious choice. But recent winners do not remain winners forever. History shows that leadership alternates: when heavyweight companies dominate, the Nifty 50 tends to lead; when performance broadens beyond a few large stocks, the Equal Weight index benefits.

Since their long-term return

The lead keeps changing hands

Nifty 50 led in 58 per cent of five-year periods, while Equal Weight led in 42 per cent

Five-year rolling returns from June 2011 to June 2026; Total Return Index (TRI) used.

difference has been negligible, the choice is less about maximising returns and more about the type of exposure you want.

Practically, the two are closer than their structures suggest. During the sharp market fall of 2020, the Equal Weight index fell no more than half a percentage point more than the Nifty 50, so its broader spread did not result in a materially deeper decline. Its fixed equal-weight mandate does lead to marginally higher tracking error and tracking difference, as winners are trimmed and laggards topped up at each rebalance. But with all 50 constituents being large and liquid, this is not a meaningful concern.

Choose the Nifty 50 if you want market-like exposure with larger companies carrying larger weights, or the Nifty 50 Equal Weight if you want slightly more aggressive exposure while still owning India's largest companies.

However, if you already own either index, there is little reason to switch based on recent outperformance, as both hold the same companies and have delivered similar long-term results. ☒

Weights explain the return gap

Equal Weight benefited from stronger-performing stocks getting a larger share of the portfolio

Quartile	Average 3Y return (% p.a.)	Weight (%)	
		Nifty 50	Nifty 50 EW
Q1	26.6	14.7	20.3
Q2	14.8	23.5	22.1
Q3	8.3	13.8	22.0
Q4	-5.5	42.1	21.6

43 stocks present throughout the three-year period, grouped by three-year annualised returns as of July 24, 2026; weights are three-year averages.

[SCOREBOARD] Guide

Optimise your investments with clear and comprehensive mutual fund data

► Serial Number

A serial number is generated for every fund and is the first column on the Scoreboard. To locate a specific fund, look for this number in the Index against the name of the fund.

► Portfolio Composition

For equity funds, it shows the portfolio's allocation in large-, mid-, small-cap stocks and cash/others. **Value Research** follows its own market-cap classification to arrive at this. The top listed companies that constitute 70 per cent of the market cap are classified as 'large caps'. The ones that fall between 70-90 per cent of the total market cap are classified as 'mid caps'. The smallest listed companies that comprise the remaining 10 per cent of the market cap are called 'small caps'.

In the case of hybrid funds, the minimum and maximum allocations to equity and debt over the past 12 months are displayed. For funds launched within the last year, the available historical range is provided. The equity exposure is shown net of derivatives (unhedged portion).

Portfolio Composition (%)

Equity		Debt	
Min	Max	Min	Max

► Alpha

Indicates value added (or subtracted) by the fund vis-a-vis the benchmark, for the risk taken. A positive alpha indicates that the fund has performed better than expected, while a negative alpha indicates the fund has underperformed based on the risk taken by the fund manager. It is calculated using calendar month returns for the last three years.

S.No. Fund Name		Performance								Portfolio Composition (%)					Info. Ratio	Risk Grade	Expense Ratio (%)	Assets (₹ cr)	Fund Rating	Average Rating							
		Returns (%)				Rank				Large Cap	Mid Cap	Small Cap	Cash & Others	Alpha													
		1Y	3Y	5Y	10Y	1Y	3Y	5Y	10Y																		
																			Portfolio Composition								
																			Credit Quality (%) Avg. Maturity								
																			High	Medium	Low	(years)					

Portfolio Composition

Credit Quality (%)			Avg. Maturity (years)
High	Medium	Low	

► Credit Quality

Debt fund's portfolio exposure across three levels:

- **High**
Includes exposure to government securities and corporate bonds with the highest grade ratings such as AAA, AAA+, AAA-, A1, A1+, P1+, AA+ and cash.
- **Medium**
Includes exposure to bonds with medium grade ratings such as AA, AA-, A2+ and A2.
- **Low**
Includes portfolio exposure to bonds with lowest grade ratings such as A+, A, A-, A3, BBB+, BBB, BBB-, BB+ and below.

► Average Maturity

Weighted average maturity of all debt securities held by the fund.

► Information ratio

Indicates excess returns generated by a fund relative to the category benchmark and the consistency of that out-performance. A higher information ratio compared to other schemes with the same benchmark reflects better risk-adjusted performance. It is calculated using calendar month returns for the past three years.

► Risk Grade

Value Research Fund Risk Grade measures a fund's risk of loss, focusing only on downside volatility, unlike standard deviation and beta. It accounts for absolute losses and periods of underperformance compared to a risk-free investment. This reflects the risk of earning less than a guaranteed return, such as from a term deposit. Fund risk is calculated by comparing monthly/weekly returns to the risk-free return (State Bank's 45-180 days Term Deposit Rate) and measuring underperformance. Average underperformance is used to derive a risk score, which is rated against the category average. The risk score of a fund is then rated according to the following distribution:

High : Top 10%
Above Avg (+Avg) : Next 22.5%
Average : Middle 35%
Below Avg (-Avg) : Next 22.5%
Low : Bottom 10%

► Fund Rating

The **Value Research Fund Rating** is a convenient composite measure of returns and risk, based on a quantitative system without any subjective components. It provides a quick summary of a fund's historical performance relative to its peers, adjusted for risk. For equity and hybrid funds, the system combines three- and five-year performance periods, while debt funds' ratings are based on 18 months and 36 months of weekly risk-adjusted performance. Only equity funds with a minimum three-year performance history are rated, and for debt funds, the minimum is 18 months. A category must have at least 10 funds with an average AUM of at least ₹5 crore over the past six months to be rated. The rating distribution is as follows:

★★★★★ : Top 10% funds
 ★★★★★ : Next 22.5%
 ★★★ : Middle 35%
 ★★ : Next 22.5%
 ★ : Bottom 10%
 NR : Not Rated

► Average Rating

The average of the monthly fund ratings over the past three years. For newer funds, the available rating history is used.

Numbers are in ₹ lakh; - indicates that the fund lacks sufficient performance history; data as of July 31, 2026

[END NOTE]

Winning in corrections

While the Nifty dipped, patient investors in the largest funds pulled ahead

These 20 funds account for a third of the money invested in India's active equity funds, so most equity investors likely hold at least one of them. Yet their actual, money-weighted returns tell a story markedly different from the index's.

Nifty 50 fell almost 3.4 per cent from its September 2024 peak. Over that period, an SIP investor in the index would have earned close to 2.4 per cent, while investors in the top 20 active equity funds earned annualised returns ranging from 1.8 to 14.8 per cent.

Outcomes improve the longer investors stay invested. Over the past year, the median return across the top 20 funds was 1.4 per cent; over three years, that climbs sharply to 13.4 per cent.

Index returns (% pa)

XIRR returns based on monthly flows in the respective direct plans of the schemes till June 30, 2026. Funds have been sorted on three-year returns.

Wealth sets you free

GET

ready for every market condition

SET

with a diversified allocation approach

GO HYBRID

EQUITY+DEBT+COMMODITIES+InvITS

BALANCES MARKET VOLATILITY

Hybrid Funds invest in Equity that aims for capital appreciation, Debt that may offer income potential and relative stability, and Commodities that may potentially act as a hedge against inflation, thus helping you optimise asset allocation and manage downside risk during varying market cycles.

Equity Savings Funds

A mix of equity, debt and arbitrage strategies for relatively balanced investing and potential tax-efficient equity-oriented exposure, subject to prevailing tax laws.

Balanced Advantage Funds

Dynamically allocates across equity and debt to navigate changing market conditions through a balanced, long-term investment.

Multi Asset Allocation Funds

Diversifies across equity, debt and commodities to participate in opportunities across multiple asset classes.

Balanced Hybrid Funds

Invests in a balanced mix of equity and debt instruments to aim long-term growth while managing portfolio volatility.

Back to Basics

12 lessons that build a better investor

An investor education initiative by

LIC MUTUAL FUND

Markets recover. Emotional decisions *don't*.

Most investors prepare for volatility in the market. Few prepare for volatility in themselves.

Investing is a discipline. Reacting is a Choice.

A well-structured investment approach helps keep short-term emotions from overshadowing long-term goals.

To know more, please consult your Financial Adviser

Mutual Fund investors need to complete the Know Your Customer (KYC) process, which can be done by submitting completed KYC Form along with the required documents at any AMC's branch Office or Official Points of Acceptance. Please refer <https://www.licmf.com/kyc-redressal> to know about KYC documentary requirement, procedure for change of address, phone number, bank details etc. The investors are cautioned to invest only with SEBI registered Mutual Funds, the details of which can be verified on SEBI's website under 'Intermediaries/Market Infrastructure Institutions' (<https://www.sebi.gov.in/intermediaries.html>.) For any complaints and grievance redressal, investors can contact the Investor Relations Officer of the respective AMC and if not satisfied with the resolution given by the AMC, he/she can approach SEBI by registering the complaint on SEBI SCORES Portal (<https://scores.sebi.gov.in/>) and/or escalate the complaint through Online Dispute Resolution Portal (<https://smartodr.in/login>).

I almost hit pause on my systematic investment plan

A market crash, a moment of doubt and the lesson I'll never forget

When the markets fell sharply last year, so did my confidence. One minute, I was proudly telling friends I had a systematic investment plan (SIP) running like clockwork. The next, I was hovering over the "cancel" button, wondering if I should stop and cut my losses.

I had started the SIP a couple of years ago after hearing colleagues talk about "long-term wealth creation." It sounded responsible and adult-like. I didn't obsess over the markets. I just picked a date, set an amount, and forgot about it. For a while, it was smooth sailing. The value of my investments inched up every few months. I even allowed myself a small, smug smile whenever I checked my statements.

Then the headlines changed.

Key takeaways

- **Volatility is not a cue to stop your SIP. It's when your SIP quietly does its best work.**
- **Rupee cost averaging helps you buy more units at lower prices during market dips.**
- **Staying invested through market cycles is often more rewarding than trying to time the perfect exit or entry.**

Inflation was up. Global events triggered panic. The market started dipping, and every news alert made it feel like the floor was slipping beneath my feet. My SIP statement looked redder each month, and for the first time, I

noticed the "current value" column. It was lower than what I had put in. That sinking feeling is hard to describe. I thought, "Why keep throwing money into something that's falling?"

One evening, I called a friend who had been investing longer than I had. I expected him to confirm my fears. Instead, he laughed. "This is exactly when your SIP is doing the heavy lifting," he

said. I didn't understand at first.

He explained rupee cost averaging, i.e., how continuing to invest during downturns helps you buy more units at cheaper prices, which smooths out the impact of volatility over time. "It feels like you're losing money," he said, "but these phases are when you're planting the seeds for future gains."

I didn't stop my SIP. I decided to ignore the news and let it run in the background, as it had before. A few months later, the markets recovered. The red turned orange, then green. I realised that my SIP had bought units at bargain prices during the dip. My overall returns were better than before, all because I didn't panic.

Conclusion

Market volatility should be seen as a natural part of investing, not a trigger to exit. Pausing SIPs during downturns can interrupt the benefits of rupee cost averaging and long-term compounding. Staying consistent through different market cycles allows investors to accumulate more units at varied price points, potentially enhancing returns when markets recover.

Wealth creation is less about predicting short-term movements and more about disciplined investing over time. By maintaining SIPs through both highs and lows, investors give themselves the best chance to benefit from the power of time in the market.

She took a career break. Her mutual fund plan didn't

A pause in work doesn't have to mean a pause in financial progress

When I decided to take a career break, I knew I was stepping away from more than just a job. It meant leaving behind a routine, a pay cheque, and a sense of financial independence I had built over the years. What I didn't expect was how uncertain I'd feel about my investments.

I had always been fairly organised with money. My SIPs (Systematic Investment Plans) into mutual funds were set up for long-term goals, retirement, and my son's education.

They ran quietly in the background while I focused on work. But once the income stopped, I began to second-guess everything.

"Should I pause my SIPs until I start earning again?" "Is it irresponsible to keep investing when income is uncertain?"

The instinct to retreat was strong. But before making any decisions, I reviewed my finances. I had an emergency fund that could cover my expenses for nearly a year. My SIP amounts were modest. After speaking

real life.

By the time I rejoined the workforce a year later, the markets had stabilised. My SIPs had not only stayed on track, but they had also strengthened my portfolio. More importantly, they gave me a sense of financial continuity during a phase when everything else felt uncertain. That consistency helped me feel in control, even when life was in flux.

Conclusion

Taking a career break may feel like pressing pause on life, but it doesn't have to mean pausing your financial journey. If your essentials are covered, continuing your SIPs may help you stay aligned with your long-term goals. Even modest investments may reinforce a sense of progress and control.

Mutual fund SIPs offer more than just returns. They bring discipline, consistency, and the ability to benefit from market cycles, even when you're not actively watching. For women navigating transitions like career breaks, childcare, or personal reinvention, financial continuity may be a quiet source of strength.

You don't need to make bold moves to stay financially resilient. Sometimes, the smartest thing you may do is simply not stop. Let your investments keep working in the background. When you're ready to return, you may find that you've stayed on track quietly, steadily, and confidently.

Life may have pauses. Your investments don't have to.

Key takeaways

- Market dips may help you accumulate more units through rupee cost averaging.
- Small, steady investments may keep your financial goals on track.
- Financial continuity during life transitions may boost confidence and control.

with a financial advisor, I chose to continue investing.

It turned out to be a wise decision.

During my break, the markets went through a rough patch. Every dip made me nervous, but I reminded myself of the basics: lower markets meant I was buying more units for the same SIP amount. I had read about rupee cost averaging, but this was the first time I saw it play out in

My father always saved. I started investing

A millennial shift from money kept aside to money put to work

I grew up watching my father save with military precision. Salary in, expenses out, and the rest neatly parked in a savings account or a fixed deposit. It was safe, visible and reassuring. When I started earning, I followed the same routine—moving money into a separate account every month. It felt responsible. However, within a year, I realised something was missing. The pile was growing, but far too slowly.

That's when the difference between saving and investing clicked. Saving keeps money handy for emergencies. Investing puts money to work so it grows faster and helps achieve long-term goals. Both matter. I just needed the right balance.

I split my money into two buckets. The first was for emergencies, where stability and liquidity mattered more than returns. Here, I turned to liquid debt funds to act as a cushion against unexpected shocks.

The second bucket was for long-term goals. This needed growth. I set up small, regular investments in diversified equity mutual funds through SIPs (systematic investment plans). I wasn't chasing the next big winner. I chose consistency and tuned out the market noise. When markets dipped, my instinct was to pause. However, I learned that downturns meant buying more mutual fund units at cheaper prices, which could improve outcomes over time.

Key takeaways

- **Save for emergencies and near-term needs.**
- **Invest for long-term goals to beat inflation.**
- **Stay disciplined: automate investments, review yearly, step up with income.**

I also built one more habit. Every time my salary rose, I stepped up my SIP. It curbed lifestyle creep and pushed my future self ahead. Once a year, I review my goals and shift money for near-term needs to options like debt funds. That simple rebalancing helps protect what I've built while keeping growth intact for the long haul. These habits gave me both security and momentum.

Conclusion

The lesson is simple: the

difference between saving and investing is central to financial security. Savings provide liquidity and stability for emergencies and short-term needs. But when left only in low-return vehicles, money steadily loses value as inflation erodes its purchasing power.

Investing, especially in equities, plays a complementary role. It harnesses compounding to build long-term wealth and fund goals like retirement or education. Of course, equities bring short-term volatility and can lead to notional losses during market downturns. What matters most in such times is the discipline to stay invested and avoid the mistake of turning temporary declines into permanent ones.

A sound financial plan assigns each its role—savings safeguard the present, investments secure the future. Together, they strike a balance that offers both stability and progress.

A 15-minute habit that changed my financial future

How a simple routine became the foundation of my financial journey

When I started earning, I believed wealth building required complex strategies, spreadsheets, market predictions and constant tracking. But the real turning point came from something surprisingly simple: a 15-minute monthly habit.

Every month, on the day my salary arrived, I took a short pause to check in on my finances. I reviewed my **investments**, ensured **my budget was on track**, and occasionally revisited my **financial goals**. It wasn't about reacting to market movements; it was about staying connected to my money.

This small routine gave me clarity. I wasn't trying to time the market or chase trends. I was building consistency. Over time, I saw how systematic investment plans (SIPs) helped me invest across market cycles, using **rupee cost averaging**. But more importantly, I saw how discipline, not timing, was the real driver of progress.

Some months, markets dipped. It was tempting to pause. But I reminded myself that lower prices meant more units. Staying invested through those phases made a difference when markets recovered.

As my confidence grew, the habit evolved. I started:

- Adjusting my SIPs after salary hikes
- Reviewing my asset allocation annually
- Setting reminders for financial goal check-ins
- Tracking monthly expenses to stay within budget
- Using simple tools to monitor progress toward long-term goals

Key takeaways

- A short, consistent financial habit can lead to long-term clarity and growth.
- SIPs help navigate market ups and downs through rupee cost averaging.
- Regular reviews and goal alignment reduce emotional decision-making.
- Budgeting and goal tracking complement investing for holistic financial health.
- Discipline and time in the market matter more than timing the market.

That 15-minute pause became more than a task; it became a moment of reflection. It helped me stay focused, reduce impulsive decisions and build a sense of control over my financial future.

Conclusion

The strength of this habit lies in its simplicity. Whether it's reviewing SIPs, tracking expenses, or aligning goals, consistency is key. SIPs, in particular, work best when approached as a long-term commitment rather than a short-term tactic. Over time, they may benefit from rupee cost averaging and the potential effects of compounding, helping investors stay consistent through different market conditions.

Wealth isn't built by reacting to every market move. It's built by showing up month after month and giving time to the process. And when paired with basic budgeting and goal tracking, this habit becomes a powerful tool for financial wellness.

We wanted a new car, but chose mutual funds instead

How one decision reshaped our financial priorities

Have you ever been tempted by something big—a shiny new car, the thrill of an upgrade—only to realise it might derail your financial goals? A few years ago, my husband and I faced that exact dilemma.

It started innocently enough: a weekend test drive, a glossy brochure, and the feeling of sinking into a brand-new car seat. The salesperson made it sound easy. “Just an EMI away from a lifestyle upgrade.” For a week, we convinced ourselves that buying the car was a reward for working hard.

But then reality stepped in.

One evening, we sat down with our expenses. Between rent, school fees for our daughter, insurance premiums, and existing SIPs, that EMI didn’t look so harmless anymore. Buying the car would mean cutting back on investments, including the SIP we had started for our daughter’s future. That’s when the real conversation happened.

“Do we want a new car today,” my husband asked, “or a stronger financial foundation tomorrow?”

It wasn’t dramatic. Just practical. A realisation that instant gratification is powerful, but so is the peace of knowing your long-term goals are within reach.

We postponed the car purchase and redirected the EMI amount into a dedicated mutual fund SIP. It wasn’t easy watching friends flaunt their new cars while we stuck with our old, reliable one. But each month, when we saw our SIP deduction, it felt less

Key takeaways

- **Prioritise long-term goals before lifestyle upgrades.**
- **Redirecting potential EMIs into SIPs can strengthen financial planning.**
- **Delayed gratification helps avoid impulsive, debt-driven purchases.**
- **Start small but start today, your future deserves priority.**

like a sacrifice and more like a commitment to our future.

Over time, that decision gave us clarity. We realised how easily short-term desires can dilute long-term priorities. By choosing to invest instead of indulge, we created space for multiple goals, our daughter’s education, a future home upgrade, and yes, even the eventual car purchase, but in a financially comfortable way.

Conclusion

Delaying gratification isn’t about

denying yourself joy; it’s about sequencing your financial decisions wisely. A mutual fund SIP helps build a corpus gradually, allowing investors to stay aligned with their goals without relying on debt-heavy purchases. The discipline of investing before spending can be especially meaningful for families managing multiple responsibilities.

When you choose to invest first, you’re prioritising your goals. Every SIP is a step toward achieving what matters most, whether it’s education or even that car in the future. Over time, these small, consistent contributions can add up, giving you flexibility to make lifestyle upgrades without strain. Think of it this way: a car depreciates once you drive it out of the showroom, but an investment has the potential to grow over time. By focusing on long-term goals over short-term excitement, you create room for better choices and avoid impulsive, debt-driven decisions. And when the time eventually comes to buy that car, it may be done with far more confidence and far less compromise.

Retirement was 20 years away...until it wasn't

Why an unexpected jolt taught me the importance of planning early

For most of my working life, retirement felt like a distant milestone, something to think about later, once career pressures eased and income peaked. I believed I had decades to prepare. Then one event changed everything and compressed that comfortable timeline overnight.

It wasn't a dramatic resignation or a conscious decision to retire early. It was a sudden disruption: a job loss, followed by a health scare in the family. Within weeks, priorities shifted. Income uncertainty replaced career momentum. Questions I had postponed for years demanded immediate answers:

How long could my savings last? What if returning to work took longer than expected? What if this was not a pause, but an early exit?

That was when I realised how fragile my assumptions had been.

Until then, retirement planning had lived quietly on the sidelines. I contributed occasionally but never treated it as urgent. The logic seemed sound; more time meant more flexibility. What I hadn't accounted for was life's ability to redraw timelines without warning.

The realisation was sobering; retirement planning isn't just about age. It's about independence. It's about ensuring your future doesn't depend entirely on your ability to earn. When that ability is disrupted, even temporarily, the value of early preparation becomes clear.

Key takeaways

- Retirement timelines can change unexpectedly.
- Early planning reduces reliance on regular income.
- A retirement corpus provides flexibility during disruptions.

Revisiting my investments with a new lens was uncomfortable but necessary. How much of my portfolio was truly meant for retirement? Was it growing fast enough if the earning years were fewer than expected? These questions changed my approach.

What helped was having something already in place. Even though my corpus was smaller

than ideal, it gave me options. It bought time, reduced pressure and allowed me to think clearly instead of reacting in panic. That alone justified starting early.

I also understood why retirement portfolios need balance. Growth assets help build the corpus, but stability becomes crucial as the horizon shortens. Planning early allows this shift to happen gradually, rather than forcing rushed decisions later.

The experience changed how I look at retirement planning. It's no longer a distant goal tied to an age bracket. It's a financial safety net that must be built while income is steady and time is available. Waiting for certainty before planning is risky because certainty rarely arrives.

Conclusion

Early retirement planning isn't about predicting when you'll stop working. It's about preparing for the possibility that you may have to. Life can accelerate timelines without notice, and when it does, preparation determines choice.

Starting early gives compounding time to work, reduces reliance on last-minute contributions and provides flexibility as circumstances change. Most importantly, it offers peace of mind. Retirement planning, done early and consistently, ensures that when plans change, your financial foundation doesn't have to.

I invested for my daughter's dreams, not just marriage

Why planning for freedom matters as much as planning for celebrations

When my daughter Ananya turned seven, my mother-in-law handed me a fixed deposit receipt. "This is for her wedding," she said warmly. I thanked her, but something about that moment stayed with me.

Later that evening, I found Ananya drawing a "flying library" that could deliver books to remote areas. When I asked what she wanted to do when she grew up, she replied, "I want to build things that help people, Maa."

There I was planning for one day in her life, while she was imagining an entire lifetime of possibilities. Why was I saving only for her wedding when I hadn't started investing for her education, ambitions, or independence? That realisation changed everything.

What if Ananya wanted to study abroad? Start her own company? Explore the world? The fixed deposit was a thoughtful gesture, but planning only for tradition wasn't enough.

So, I started an SIP with a broader purpose. I wanted to create a financial foundation for whatever path Ananya chose: higher education, entrepreneurship, travel, or even marriage. I began small, with an amount I could commit to comfortably each month. As my income grew, I gradually increased my contributions.

As Ananya grew older, I included

Key takeaways

- Plan for your daughter's education, independence and aspirations, not just her wedding.
- Investing is about having a long-term vision for goals that may unfold over time.
- Start early to allow compounding to build meaningful wealth.

her in these conversations. On her 16th birthday, I showed her the portfolio. "Maa, this could pay for my architecture degree," she said, her eyes wide with excitement.

Exactly. The choice would be hers and that freedom was what I was truly investing in.

This journey taught me that

saving only for marriage limits how we imagine our daughters' futures. Even modest monthly contributions can grow into meaningful wealth over time. Compounding works powerfully if you give it the years.

Including Ananya in financial discussions also gave her knowledge that she will use for the rest of her life. She learned how investments grow and why financial independence matters.

Planning for my daughter's complete future didn't mean abandoning tradition. With the right mix of investments, a well-structured portfolio can support both education and celebrations. The goal was never to choose one over the other; it was to create options.

Conclusion

Financial planning begins by widening our vision. Starting early and investing consistently through mutual funds may allow compounding to create a substantial corpus over time. This gives young women the financial foundation they need to pursue their aspirations. Our daughters deserve investments that reflect the full range of their potential, not just one anticipated event. When families plan for complete futures rather than only weddings, they affirm their belief in limitless possibilities and empower women with true freedom of choice.

We had investments, but no liquidity for an emergency

How one crisis taught us the importance of keeping money accessible

For years, I believed we were financially prepared. We had investments for long-term goals and contributions running regularly. On paper, everything looked responsible. We often reassured ourselves that if something unexpected happened, we would manage. Then came the emergency.

It was a medical situation that required immediate attention, the kind where decisions must be made in minutes. As we moved between hospitals and urgent phone calls, we realised that most of our money was tied up in long-term investments. The money existed, but we couldn't access it immediately.

In that stressful moment, the gap between investments and liquidity became painfully obvious. What we needed was quick access to money, not investments designed to stay untouched for years.

That experience forced us to rethink how we defined financial preparedness. Until then, we treated all our money as one pool; investments meant for long-term goals and funds that might be needed urgently were grouped together, assuming we could rearrange things if needed. Reality proved otherwise.

Emergency funds are for a specific purpose. They are not meant to chase returns. They exist so that when life takes an unexpected turn, money is available without delay.

Once the situation passed, we reorganised our finances with that lesson in mind.

We created a separate emergency

fund designed purely for accessibility. This pool of money was kept in avenues that allow quick withdrawal when required. It sat alongside our long-term investments rather than replacing them.

That separation brought clarity. Money meant for future goals could remain invested without being disturbed by short-term crises.

At the same time, the emergency fund ensured that unexpected events would not force hurried financial decisions.

More importantly, it restored a sense of control. When emergencies occur, the situation itself is already overwhelming. Financial uncertainty

should not add to that burden.

The experience reminded us that sound financial planning is not only about building wealth over time. It is also about ensuring that the right resources are available when life demands them.

Conclusion

Emergencies rarely arrive with warning. When they do, immediate access to funds matters far more than long-term returns.

An emergency fund acts as a financial buffer, allowing families to respond quickly without disturbing investments meant for future goals. By keeping a portion of money readily accessible, investors build resilience into their financial plans.

Planning for emergencies is therefore not separate from investing. It is an essential part of responsible financial management. When liquidity is built into the plan from the start, unexpected situations become easier to navigate and long-term goals can remain on track.

Key takeaways

- Financial preparedness is about access, not just accumulation.
- Emergencies require liquidity, not long-term investments.
- A separate emergency fund prevents forced withdrawals.

Each time my income grew, I made sure my SIP grew along with it

A small habit that could aid an investor's compounding journey

I remember the day my first salary came in. I was twenty-three, freshly employed, and for the first time, money was flowing in rather than out. Rent, commute, groceries, the occasional dinner with friends, all had their claims on it. But after everything, some amount still remained. Not much, just enough to make a small choice.

A colleague, a few years senior, gave me advice I almost ignored. "Start a SIP with whatever you can. And when your salary goes up, increase it before you get used to the extra." Simple enough to brush off, but sensible enough to stick. I started with ₹3,000 a month.

My first appraisal came about a year later, a raise of roughly ₹8,000 a month. The thought of a better phone or a weekend trip crossed my mind briefly. Instead, I raised the SIP by ₹2,500 that same week. My lifestyle barely noticed. Within a month, I had settled into the new take-home pay just fine.

That became my system. Every appraisal, the SIP went up first, but not by the full raise, because I didn't want to feel like I was punishing myself. A portion stayed in my account for lifestyle spending. But a meaningful share moved into investments before my habits could absorb it.

Increments grew over the years,

and the SIP followed. What started at ₹3,000 had reached ₹25,000 a month by my mid-thirties. No grand plan behind it, just one habit repeated across every appraisal cycle.

The strangest part was how normal it all felt. No sacrifice, no sense of missing out. Life had improved, just not in step with every rupee earned. The rest had been compounding steadily in the background.

When I reviewed my portfolio a decade in, the number took a moment to sink in. No windfall, no big bet. Just the result of habit and time.

Conclusion

Lifestyle inflation is one of the easiest traps in personal finance. Expenses tend to rise with income, and before long, every

increment feels spoken for before it even arrives.

Stepping up a SIP with every raise tackles this directly. The amount is committed before spending adjusts, so the habit sustains itself with very little effort. Over time, each increment adds to a growing base, and compounding works on more than just the original sum.

The earlier this pattern starts, the longer compounding has to do its work. Across a career, that difference is rarely small.

Key takeaways

- Step up your SIP with every salary raise.
- Lifestyle inflation is quiet, but compounding is louder.
- The earlier you start, the harder compounding works.

I didn't understand risk. Until I understood myself

What a market fall revealed about my real risk tolerance

When I started investing, I did what most first-timers do. I read a little, asked around a little more, and concluded that I was a risk-taker. I was 24, earning steadily, with no major financial obligations. On paper, I had every reason to be aggressive. So, I went straight into high-risk funds with exciting recent returns.

For several months, things looked pleasant. The portfolio was growing, and I felt rather clever about the whole thing.

Then the market started correcting.

Within a few weeks, my portfolio had fallen meaningfully. Nothing catastrophic by market standards, but enough to make me uncomfortable. What surprised me was not the fall itself. It was how I felt about it. I refreshed my portfolio screen far too many times each day. I lost sleep over a few percentage points. I began questioning every fund choice and nearly redeemed everything at the worst possible moment.

That reaction told me something important. I had assessed my risk appetite, the risk I was willing to take, and completely overlooked my risk capacity, the risk my financial situation and emotional temperament could actually absorb. The two turned out to be quite different.

After some reflection, I spoke with a financial adviser who helped me reframe the question. Rather than asking what kind of investor I wanted to be, she asked what a loss would actually mean for me at this stage of life. The

answer reordered everything.

I restructured my portfolio, keeping growth-oriented exposure but balancing it with more stable instruments to reduce volatility. The portfolio became less dramatic and far easier to stay invested in.

That last part mattered most. Staying invested without panic is worth considerably more than chasing the highest possible return with money you cannot emotionally afford to lose.

Conclusion

Risk appetite and risk capacity are often mistaken for the same thing. Risk appetite is how much risk an investor feels comfortable taking. Risk capacity is how much risk their financial situation and mental temperament can genuinely absorb. The gap between the two is where most early investing mistakes are made.

Choosing funds that match both is essential. An overly aggressive fund chosen purely on return potential, without accounting for how one might respond during a downturn, can lead to panic redemptions at precisely the wrong time.

Understanding oneself as an investor, honestly and without flattery, leads to better fund choices, steadier behaviour during volatility, and a far greater chance of staying on course when markets become unsettling.

Key takeaways

- Risk appetite and risk capacity are not the same.
- Choose funds your temperament can keep you invested in.
- Self-awareness leads to steadier, smarter investing.

My approach changed from just investing to planning comprehensively

How a health scare reordered my financial priorities

By my mid-thirties, I felt I had most elements of personal finance in place. My portfolio was growing steadily, SIPs were running regularly and I had a fair sense of where I wanted to be a decade later. My wife and two children seemed well provided for or so I believed.

Then my father-in-law suffered a sudden cardiac episode. He survived, thankfully. But the weeks that followed hospital bills, borrowed funds and financial strain, left a lasting impression.

One thought kept returning: what if this had been me?

That question led me to review my finances through a different lens. On the surface, everything seemed fine. Investments were on track. But beyond returns, some gaps were hard to ignore. My health cover depended entirely on my employer, my life insurance was minimal and there was no clear contingency plan.

More importantly, what I had wasn't really a plan, it was a collection of investments.

That distinction became crucial. I had focused on wealth creation, but not on securing my family across different life situations. My portfolio assumed everything would go as expected. It wasn't built to handle uncertainty.

A conversation with a financial advisor brought clarity. The key

insight wasn't about products, but perspective. Financial planning isn't about choosing between investments and insurance, it's about aligning both with life's risks and responsibilities.

We broke it down into four pillars:

Pillar	Purpose
Protection	Life and health insurance against income loss or medical shocks
Growth	Investments for long-term wealth creation
Liquidity	Emergency funds for short-term needs
Goals	Clear mapping of education, retirement and lifestyle needs

Seen this way, the imbalance was clear. Growth had been prioritised, while protection and liquidity were underdeveloped. Goals lacked clarity.

The changes that followed weren't dramatic, but they were deliberate.

Key takeaways

- Investments create wealth, but wealth alone does not ensure financial security.
- Insurance is one component of a broader financial planning framework.
- Emergency liquidity is as critical as long-term growth.
- Financial planning requires alignment of growth, goals, and risk coverage.
- A complete plan prepares you for both success and uncertainty.

I put adequate life insurance in place, added health cover independent of my employer and built an emergency fund to handle a few months of expenses without touching long-term investments.

At the same time, I revisited my portfolio with more intent. Instead of building a generic corpus, investments were aligned with specific goals, children's education, retirement and key milestones.

Individually, these steps were simple. Together, they reshaped how my finances were structured. What once felt scattered began to resemble a clear plan.

The first outcome was clarity. The more meaningful one was peace of mind.

Conclusion

Financial planning is often seen as either investing or buying insurance. In reality, it is the combination of growth, protection, liquidity and goal alignment that creates resilience.

Investments help us move forward. Protection ensures setbacks don't push the family backward. Liquidity may help manage uncertainty.

A well-built portfolio matters. But a well-structured plan ensures that what is being built today remains secure, even when life does not go as expected.

What I learnt after investing in every new fund

Why chasing trends taught me the value of a clear investing strategy

When I began investing, new fund launches fascinated me. Every month seemed to bring a fresh offering with a compelling story.

A new theme, a clever strategy or a sector expected to see growth potential. I told myself I was diversifying. In reality, I was collecting funds the way people collect souvenirs.

If a fund was linked to a fast-growing sector, I wanted it. If a strategy promised to capture the next big trend, I did not want to miss out. Each investment felt logical in isolation. Together, they created a portfolio that lacked direction.

At first, this approach felt exciting. My portfolio looked busy and sophisticated. But when I finally sat down to review it, the cracks began to show. Many funds overlapped. Some moved wildly with market moods. Others quietly did nothing. I struggled to explain why I owned half of them.

The biggest lesson came during a market correction. Some of these funds fell sharply, while others barely moved. I found myself unsure what to hold, what to exit and what role each fund was meant to play. Decisions became reactive rather

than thoughtful. That was when I realised I had been investing without a strategy.

I decided to simplify. I started by defining my goals and time horizon. Then, I rebuilt the portfolio around a smaller set of diversified funds that aligned with those goals. Each fund had a clear role, whether for long-term growth or stability. I stopped adding funds simply because they were new or popular.

This shift changed how

I experienced market movements. Instead of reacting to headlines, I focused on consistency. Systematic investments became easier to maintain because the portfolio made sense. Reviews became calmer because I knew what each fund was meant to do.

That does not mean new funds are always a bad idea. Some offer genuine innovation or access to evolving opportunities. But they should earn a place in the portfolio, not arrive by default. Without a core strategy, even good funds can add confusion rather than value.

Conclusion

The lesson from my trial-and-error is simple. Investing works best when it follows a plan rather than a trend. A clear strategy provides structure during both rallies and corrections, helping investors stay disciplined when markets tempt them to act impulsively.

Trends come and go. Strategies endure. By building a portfolio around clear goals, diversification and consistency, investors reduce the need for constant decisions. Over time, that clarity matters more than catching every new idea. The most reliable progress often comes not from doing more, but from doing less and doing it well. ☒

Key takeaways

- Chasing trends can lead to cluttered portfolios without clear direction.
- Every fund should have a defined role linked to your goals.
- A simple, diversified strategy is easier to stick with across market cycles.
- Consistency and clarity matter more than owning the latest fund.

SEBI Reg: LIC Mutual Fund | Reg No: MF/012/94/05. Mutual Fund investors need to complete the Know Your Customer (KYC) process, which can be done by submitting completed KYC Form along with the required documents at any AMC's branch Office or Official Points of Acceptance. Please refer <https://www.licmf.com/kyc-redressal> to know about KYC documentary requirement, procedure for change of address, phone number, bank details etc. The investors are cautioned to invest only with SEBI registered Mutual Funds, the details of which can be verified on SEBI's website under 'Intermediaries / Market Infrastructure Institutions' (<https://www.sebi.gov.in/intermediaries.html>.) For any complaints and grievance redressal, investors can contact the Investor Relations Officer of the respective AMC and if not satisfied with the resolution given by the AMC, he/she can approach SEBI by registering the complaint on SEBI SCORES Portal (<https://scores.sebi.gov.in/>) and/or escalate the complaint through Online Dispute Resolution Portal (<https://smartodr.in/login>).

LIC MUTUAL FUND

INVESTING KA EASY BUTTON

No stock-picking. No guesswork.
Just your money, spread across the
market automatically.

What is a Passive Fund?

A passive fund (Index Fund or ETF (Exchange Traded Fund)) mirrors a market index like Nifty 50 Index or Sensex Index. It doesn't try to beat the market, it simply follows it. Your money is spread across all companies in the index, in the same proportion. Simple, transparent, low-cost.

Lower Cost

Since the fund tracks an index, it typically carries a lower expense ratio, keeping your investment costs transparent.

Full Transparency

You always know exactly what you own.
No surprises, no black boxes.

Diversification within Index/ Sector

One fund. Many companies. Many sectors in a single step.

You don't need to find the best stock. Sometimes, owning the whole market is the smartest move.

Curious about passive investing?
