- Holistic education with moral values and character building
- Dedicated Kindergarten and Primary Section

CAREER PATH

A Special Focus on Higher Education

As TNEA 2026 engineering counselling gets underway, students navigating choice filling and top college seats must look beyond cut-offs and popular branch hype to build a realistic preference list aligned with their genuine academic interests.

Your Rank, Their Advice and One Career Decision

Haarshini Agarwal

The Anna University counselling season has a familiar soundtrack: A parent asking, “What is your cutoff?” A friend sending a screenshot of their rank. A relative confidently announcing that a particular college is the only sensible option. And a student, somewhere between friends getting their desired choice of college and courses and filling out paperwork, is wondering: “But what do I actually want?” For thousands of students across the State, the weeks following the Class 12 results are rarely quiet. The dining table becomes a counselling desk. The family WhatsApp group becomes an unofficial admissions helpline. Google searches multiply. Every college name is followed by the same questions: What is the cutoff? How is the placement? Is the campus good? Is it worth the travel? Can I get CSE? Should I choose a better branch or a better college? With Anna University counselling 2026 underway, the biggest decision for students is not simply getting a seat. It is knowing what to do when the choice is finally in front of them.

The Tamil Nadu Engineering Admissions, or TNEA, process is the gateway for undergraduate engineering admissions across the State. For students, this could mean choosing between a department at Anna University, a government engineering college, an established institution closer to home or a college that offers a particular branch they are keen on.

The 2026 rank list was released on July 1, with 53 students securing a perfect 200 cut-off. The competition for popular branches and institutions

is expected to be intense, particularly among students aiming for Computer Science and allied courses.

But here is where the counselling process becomes more complicated than simply looking at a rank and matching it with a college. Your rank tells you what may be possible.

It does not tell you what you should choose. The power of choice still sits in your hands.

How far are you willing to travel?

For a student living in eastside of city, a college in the southern suburbs may mean a daily commute that takes hours. For someone in the west of the city, a college in the northern part of the city could present a completely different challenge.

Distance, therefore, is not a minor detail. A course that looks attractive on paper can feel very different when the daily routine involves several hours of travel. Students should consider whether they are comfortable with a long commute, whether hostel accommodation is available and whether the college's location will affect their everyday life.

In a city where travel time can become a significant part of the day, the question is, “Can I realistically do this every day for four years?”

What should go into your preference list?

This is where the counselling process can become a family debate. One person wants the most popular branch. Another insists on a particular college. A friend says a specific course has better placements. A senior says the college culture matters more.

All of them may have a point. But the final preference list has to belong to the student. The TNEA process involves choice filling, locking preferences, tentative allotment and confirmation. Students also have options related to upward movement after an initial allotment, depending on the counselling process and the rules applicable to their round. The official schedule provides separate timelines for registration, certificate upload, rank publication, grievance redressal and counselling.

The important thing is to understand the order of your choices before locking them. If you would choose Electronics and Communication Engineering at one college over Computer Science at another, your list should reflect that. If you would rather study Mechanical Engineering at a college you prefer than take a branch you are not interested in elsewhere, that should also be reflected.

Do not fill the list as if you are predicting what will happen. Fill it based on what you would actually choose.

Should everyone choose CSE?

This is perhaps the question that has taken over every engineering admission conversation. The short answer is no.

Computer Science may be the right choice for a student who genuinely enjoys programming, logic and problem-solving. Artificial Intelligence and Data Science may appeal to someone interested in mathematics, computing and data. Electronics and Communication could suit a student fascinated by circuits, devices and communication systems. Mechanical, Civil, Chemical and other branches continue to lead to their own areas of study and work.

The right question is not, “Which branch has the highest package?” It is, “Can I see myself studying this subject for the next four years?”

A student who chooses a course solely because it is popular may discover that the most sought-after branch is not necessarily the best fit for them.

What if the rank is not enough for the first choice?

This is where students need to be realistic without giving up too quickly. Cut-offs change depending on demand, available seats, the number of students competing and the choices made by candidates ahead of you. Last year's cut-off can be a useful reference, but it is not a promise.

So, instead of building a list around one dream option, have a few realistic choices. And have choices that you would genuinely be comfortable accepting. The worst preference list is not just ambitious, but also with the courses and colleges the student would never actually join.

The documents matter too

The less exciting part of counselling can often create the most avoidable anxiety. Students should carefully

check the information submitted during registration and keep the required certificates ready. A mismatch in personal information, an incorrect detail or a document uploaded incorrectly can create complications at a time when the entire family is already stressed.

And while every city may have its own unofficial admissions expert, students should rely on official TNEA announcements for deadlines and instructions rather than forwarding messages on WhatsApp.

Parents, this part is for you

You have probably spent the last few months worrying about your child's future. That is understandable.

But counselling is also a moment to let the student have a voice. You can help compare colleges, fees, travel, hostel facilities, curriculum and opportunities. You can ask questions the student may not have thought of. But the student is the one who will wake up on a Monday morning and attend those classes.

A question may not be, “What did your friend choose?” It may be, “What do you want to learn?” Because the Anna University counselling process is ultimately more than a rank, a seat or a college name. It is the first time many students are making a decision that will shape their daily lives for the next four years. There will be opinions from relatives, predictions from seniors, lists ranking colleges and branches. There will be plenty of advice.

Listen to it. Then make your own choice.

After all, the person who has to live with the decision is not the person who sent the WhatsApp message saying, “Take CSE.” It is you.

In India, the question we ask children is what they'll become;
not what makes them come alive.

The Question We Forget to Ask Our Children

Siddhi Nawar

Speak to Indian students from almost any ordinary household, and you will recognise a ritual that plays out in millions of homes every report card season. A child walks in holding a sheet of paper; a relative glances at the marks before looking at the child. And then, somewhere in that half-second, before a word is spoken, a future has already begun to take shape. We are very good, in this country, at asking children what they want to become. We are far less practised at asking what makes them come alive.

Perhaps that is because the second question is unpredictable. It might return an answer no one in the family has a category for.

The trajectory of “success”

For generations, success here has followed a familiar script. Strong in mathematics: engineering. Strong in biology: medicine. Somewhere between the report card and the dinner table, a child's aptitude quietly hardens into a life sentence, decided by people who love them and are terrified for them in equal measure.

This script has not failed India. It has built hospitals, laboratories and the engine rooms of a growing economy. It has carried entire families out of poverty in a single generation. There is real dignity in that, and no honest piece about ambition in India can pretend otherwise.

But somewhere inside this well-meaning machinery sits a harder question: who gets permission to want something else?

Education, at its best, was never meant to be a sorting exercise. It was meant to be an apprenticeship in curiosity, in learning not just how to solve for x, but how to ask a better question in the first place. Jiddu Krishnamurti believed education should produce human beings who are whole, not merely employable. Intelligence, in that view, is not a mark on a transcript. It is empathy, imagination, and the nerve to think for oneself.

Rabindranath Tagore built an entire school around this conviction. At Santiniketan, classrooms had no walls in the way we imagine them; children learned under trees, through music, through art, through the seasons themselves. Tagore was not trying to manufacture efficient workers. He was trying to grow complete human beings, on the understanding that not every child blooms in the same month, or under the same light.

What is striking is how thoroughly modern neuroscience has caught up with them. Studies on intrinsic motivation keep arriving at the same finding: people learn more deeply, and remember longer, when they feel ownership over what they're learning— a sense of why, not just what. Curiosity itself lights up the brain's reward circuitry. Squeeze education down to performance alone, and students may keep scoring well; but something quieter, harder to measure, starts leaving the room.

Dreams and deserving validation

India's National Education Policy 2020 seems to sense this. It pushes for multidisciplinary learning, softer boundaries between science, arts and vocational training, more room to move between subjects that used to sit in separate, guarded compartments.

But policy travels faster than mindset.

Ask any teenager who wants to be a writer, a wildlife researcher, a game designer, a restoration ecologist, a social entrepreneur; the question that follows is almost scripted: "But what's your backup?"

Nobody asks the aspiring doctor for a backup. That asymmetry says everything. Some dreams are treated as careers. Others are treated as hobbies with delusions of grandeur. And the difference, more often than not, has nothing to do with talent, and everything to do with how familiar the dream sounds to the person hearing it.

The world these children are walking into is not especially loyal to old categories either. The World Economic Forum's Future of Jobs Report 2025 points to “analytical thinking and creative thinking as the most sought after core skills for workers in 2025”, alongside resilience, technological literacy, and the ability to keep learning long after school ends. The jobs of the next decade are unlikely to sit politely inside the boxes we're still asking sixteen-year-olds to choose between.

It is a strange kind of irony: economies are learning to reward adaptability, while many classrooms are still rewarding conformity.

None of this is an argument against ambition, or against the sciences, or against the child who genuinely dreams of becoming a neurosurgeon and deserves every resource in pursuit of that. It is an argument for the other child too: the one sketching buildings in the margins of a notebook, restoring a dying wetland on weekends, or building robots out of a broken television. Education should be in the business of multiplying futures, not quietly closing doors on the ones it doesn't recognise.

Who gets to imagine?

If there is a real inequality hiding inside Indian education, it may not be access to schools or to technology, urgent as those still are. It may be access to imagination itself.

Some children grow up surrounded by books, dinner-table arguments, and adults who say try it and see. Others inherit fear instead, fear of failure, fear of disappointing a family that sacrificed for them, fear of choosing anything that doesn't come with a guarantee. Where survival has shaped generations, certainty becomes its own kind of love language. That instinct deserves compassion, not mockery. But an education system cannot only be a security scheme. It has to also be a place where a person finds out who they are. Paulo Freire spent his life arguing against education as a one-way transfer of facts from teacher to student, insisting instead that it should awaken a person's ability to read both themselves and the world, and to imagine both differently. Swami Vivekananda made a strikingly similar claim in a different vocabulary: that education is less about pouring knowledge into an empty vessel, and more about drawing out a perfection that was already there, waiting.

Perhaps that is the dream worth protecting. Not the dream of becoming a particular job title, but the harder, slower dream of becoming fully oneself.

The role of parents & protectors

Parents, teachers, and counsellors hold more power here than they may realise. Their most important job is not always steering a child towards the "right" career. Sometimes it is simply asking better questions, and then having the patience to sit with the answers.

- ▶ What problem do you find yourself thinking about, even when no one's asked you to?
- ▶ What would you be glad to wake up for, most mornings?
- ▶ What kind of life, not job, life— do you actually want to build?
- ▶ The answers will shift, because they're supposed to. Education was never a destination reached at graduation; it is a long conversation between curiosity and experience that doesn't really end. A society that only celebrates one narrow definition of success quietly loses something every year: the researchers, the artists, the educators, the changemakers who were talked out of themselves before they ever got the chance to find out who they might have been.

The purpose of education was never to manufacture identical futures. It was to make sure every child has both the freedom and the confidence to discover their own.

Embracing Multidisciplinary Learning for Future-Ready Graduates

The Future Will Not Fit Inside One Discipline. Higher education must prepare students not just for their first job but for a lifetime of learning, adaptation, and contribution. Employers increasingly value not only technical knowledge but also the ability to solve unfamiliar problems, work across disciplines, adapt to change, and continue learning throughout their careers. This expectation is reshaping higher education itself.

Universities today face questions very different from those a decade ago. How do we prepare engineers who understand business? Managers who appreciate technology? Lawyers navigating a digital world? Healthcare professionals who improve systems and patient outcomes? The future belongs to those who can connect knowledge, perspectives, and ideas.

This philosophy lies at the heart of Vinayaka Missions Chennai Campus (VMCC), an integrated campus of Vinayaka Mission's Research Foundation (Deemed to be University). Rather than functioning as independent institutions, VMCC has evolved into a multidisciplinary academic ecosystem where engineering, management, law, arts and science, allied health sciences, health systems, and entrepreneurship strengthen one another. Learning is supported through industry-integrated programs, Centres of Excellence, advanced laboratories, simulation and clinical facilities, and an academic culture that encourages curiosity, collaboration, and innovation.

The impact of such an environment is evident daily. A student designing an Artificial

Intelligence solution may confront questions of healthcare delivery, ethics, business strategy, and public policy. Future managers learn to navigate technology-driven organizations, while legal scholars explore the implications of innovation and digital governance. Healthcare professionals increasingly understand that improving patient outcomes often requires stronger systems alongside better clinical practice.

This philosophy comes to life at the Aarupadai Veedu Institute of Technology (AVIT), where students engage with emerging technologies through industry-integrated programs with companies like Intel and HCL Tech. At the Ganesan School of Business Management (GSBM), experiential learning and industry engagement develop leadership and strategic thinking. Vinayaka Mission's Law School (VMLS) prepares graduates for a profession where law intersects with business and public policy.

Equally, the School of Allied Health Sciences combines rigorous training with clinical exposure, while the School of Health Systems focuses on healthcare quality and administration.

Learning at VMCC extends beyond the classroom, encouraging students to question, experiment, and apply their knowledge. The Ganesan Incubation and Entrepreneurship Centre (GIEC) provides mentorship and resources, viewing entrepreneurship as an extension of learning and innovation. Universities may not predict every future profession, but they can cultivate curiosity, sound judgment, and lifelong learning in their graduates.

The Power of an Educated Future

Dr. M. Mala, Managing Trustee and Chairperson of Tagore Educational Trust, has spent three decades shaping the landscape of education, healthcare and social development in Tamil Nadu.

An educationist, entrepreneur and philanthropist, Dr. M. Mala began her journey in 1995 with the establishment of Jerusalem College of Engineering, Hilton Matriculation School and Tagore Arts and Science College. In 1997, she established Tagore Engineering College, setting the foundation for what would grow into the Tagore Group of Institutions.

Today, the Tagore Educational Trust encompasses institutions across medicine, dentistry, allied health sciences, nursing, pharmacy, physiotherapy, engineering, arts and sciences, as well as school education. Its institutions include Tagore Medical College and Hospital, Tagore Dental College, Tagore College of Allied Health Sciences, Tagore College of Nursing, Tagore College of Pharmacy, Tagore College of Physiotherapy, Tagore Arts and Science College and Hilton Matriculation School.

Over the past 30 years, the group's institutions have contributed to the education of more than 80,000 graduates. Its institutions have also earned accreditations from reputed bodies including the NBA, NAAC, NABL and NABH, reflecting a sustained commitment to academic and institutional excellence.

Dr. Mala's contributions to education, leadership, women's empowerment and social upliftment have earned her several nota-

Dr. M. Mala, Founder Chairperson & Managing Trustee Tagore Educational Trust

ble honours. These include the Asia's Greatest Leader Award at the Asia's Greatest Brands & Leaders Summit in Singapore, recognition among India's 20 Pragmatic Women Leaders in the Education Industry, the Realistic Awards 2022, the Excellence in Quality Award from the Europe Business Assembly, Outstanding Excellence in Education & Quality from Academic Union Oxford and Achievements Forum-UK, the Best Entrepreneur Award from ICT Academy, Tamil Nadu, and a Doctor of Letters from International Economics University for SAARC countries in recognition of her contributions to the humanities. She has also been honoured with the Wonder Woman Award by the GEO Foundation.

For Dr. Mala, education and social responsibility are deeply interconnected. Through Tagore Medical College and Hospital, she has supported numerous initiatives aimed at extend-

ing healthcare to rural and underserved communities. Free health camps, senior citizen services, maternity care initiatives, cataract surgeries and health check-ups have helped make essential healthcare more accessible to those in need.

Her philanthropic efforts also extend beyond institutional healthcare. She has supported local panchayats and municipalities through initiatives such as the construction of cement roads, wells and public toilets, contributing to the development of essential community infrastructure.

Through her work across education, healthcare and philanthropy, Dr. M. Mala continues to demonstrate how institutions can become catalysts for wider social change. Her journey reflects a vision of education that extends beyond classrooms; one that creates opportunities, strengthens communities and contributes meaningfully to society.

The Future Is Built Beyond the Classroom

In a rapidly changing world, education can no longer be confined to textbooks and examinations. As industries evolve and technology transforms the workplace, students need opportunities to connect academic learning with real-world experience. Across the MEASI institutions, this approach is reflected through a focus on industry exposure, experiential learning, mentorship and future-ready skills.

From the Classroom to the Corporate World
At the MEASI Institute of Management, the AICTE-approved MBA programme, affiliated with the University of Madras, combines academic learning with an industry-immersive curriculum. Students gain over 625 hours of industry exposure through internships, live consulting projects, corporate mentoring, leadership workshops, case studies and simulations.

Certifications in areas including AI tools, Advanced Excel, Power BI, Tableau,

SQL, Python, Digital Marketing and Analytics further strengthen their professional readiness. Career preparation begins from the first semester through personalised mentoring, aptitude training, resume guidance, AI-enabled mock interviews and assessment-centre simulations. This industry-focused approach has contributed to strong placement outcomes, with the highest CTC reaching Rs. 27.3 lakh per annum.

Designing for a Changing World
At Measi Academy of Architecture, learning extends beyond the studio through site visits, design reviews, expert lectures and a four-month internship. Students are introduced to emerging technologies including BIM workflows, Rhino Grasshopper, 3D printing, drones and LiDAR. Workshops and collaborations also expose students to environmental design, GIS mapping, climate modelling and net-zero building approaches. International alumni

interactions and industry engagement broaden their perspectives, while final-year thesis reviews by eminent architects help prepare students for professional practice.

Building Technology Professionals
At MEASI Institute of Information Technology, the MCA programme combines academic rigour with experiential learning across Artificial Intelligence, Machine Learning, Cloud Computing, Cybersecurity, Data Science, IoT and Full Stack Development.

Live projects, hackathons, internships, research, certifications and advanced laboratories provide students with practical exposure. A structured Bootcamp, faculty mentorship, technical clubs and innovation forums support students from diverse backgrounds, while coding practice, aptitude development, communication training, resume building and mock interviews prepare them for the technology industry.

Across management, architecture and technology, one message connects the three institutions: academic knowledge is only the beginning. In an evolving job market, adaptability, digital proficiency, communication, problem-solving and a commitment to lifelong learning are increasingly essential. The future belongs not simply to those who know the most, but to those prepared to keep growing. By bringing classrooms closer to industry, the MEASI institutions are preparing students not merely for their first job, but for a lifetime of learning and professional evolution.

Aligning Academic Excellence with Industry Demands for Tomorrow's Leaders

Engineering Education for the Age of Intelligence

Dr. N. M. Veeraiyan,
Chancellor, SIMATS

As Tamil Nadu's engineering counselling season gathers momentum, aspirants and parents face a pivotal question: which institution truly prepares students for a profession being reshaped by artificial intelligence and automation?

When Machines Learn, Humans Must Evolve

Technology that once took a decade to evolve now transforms within months, rendering traditional engineering education—heavily theoretical, exam-centric, and disconnected from industry—increasingly inadequate. This rapid pace of change has given rise to Industry 5.0, which demands engineers equipped with emotional intelligence, ethical judgement, and interdisciplinary vision. At Saveetha Engineering College (SEC), this paradigm shift is embraced as an opportunity to re-define engineering education for a new generation.

Beyond the Blackboard: Redesigning the Classroom

Recognising that adaptability cannot be taught through rigid curricula alone, SEC has moved beyond one-size-fits-all models to embrace flexible learning frameworks that allow students to choose their subjects, faculty, and pace from the very first semester. The renewed emphasis on humanities and liberal arts within SEC's engineering programmes acknowledges that tomorrow's engineers must combine broad knowledge across domains with

deep technical expertise, fostering innovation and human-centric problem-solving.

Learning by Doing: The Rise of Project-Based Education

Such holistic development finds its most powerful expression outside the traditional classroom. At SEC, project-based learning and interdisciplinary hackathons immerse students in authentic industrial challenges, requiring collaboration across electrical, mechanical, and computer science disciplines. This hands-on approach is further strengthened by encouraging undergraduate research, allowing SEC students to identify real-world problems and develop practical solutions, nurturing creativity and innovation from the earliest stages of their academic journey.

Where Students Meet the Future

To translate this innovative spirit into tangible outcomes, SEC has invested significantly in cutting-edge technological infrastructure, including humanoid robotics platforms and NVIDIA DGX H100 AI supercomputing systems. These tools democratise access to advanced research technologies. Complementing this hardware is SEC's growing integration of AI-assisted learning, which enables personalised instruction and supports self-paced certification.

The Only Skill That Never Goes Obsolete

Yet even the most advanced infrastructure cannot substitute for the one competency that transcends all technological change: the capacity for lifelong learning. SEC has embedded this philosophy deeply into its approach, recognising that the ability to continuously learn, unlearn, and relearn is the enduring skill that separates successful engineers.

A Choice That Shapes Careers

For engineering aspirants, this understanding transforms the choice of institution into a strategic decision about their professional future. SEC offers more than placements—it provides exposure to emerging technologies, flexibility in learning pathways, and deep integration with industrial practice through internships and collaborative projects. Such education remains relevant and valuable, equipping SEC graduates to contribute meaningfully from day one.

Ultimately, the architecture of tomorrow's engineering education is being built at Saveetha Engineering College today.

S.A. Institutions: A Legacy of Excellence in Education

S.A. Institutions has established itself as one of Chennai's premier educational groups by offering quality education from school to higher education and professional studies. Guided by the vision of the Dharma Naidu Educational & Charitable Trust, the group is committed to academic excellence, innovation, character building, and holistic development. With modern infrastructure, experienced faculty, and industry-oriented learning, the institutions nurture competent professionals and responsible citizens.

The group comprises S.A. Engineering College, an autonomous institution affiliated with Anna University, recognized for its excellence in engineering education, research, innovation, and placements. S.A. College of Arts & Science offers diverse undergraduate, postgraduate,

ate, and research programmes with a strong focus on experiential learning, skill development, and career readiness. The S.A. School of Management (SASOM) provides an industry focused MBA programme that develops future business leaders through practical learning, internships, entrepreneurship, and corporate engagement.

The educational ecosystem also includes S.A. Polytechnic College, which equips students with technical knowledge and hands on skills

Mr D. Duraiswamy,
Chairman, S. A. Institutions.

for successful careers. Sudharssanam Vidyashram provides quality school education by nurturing academic excellence and values from an early age. Sudharssanam Paatashala, an ICSE International School, offers globally benchmarked education that fosters creativity, critical thinking, and holistic development in young learners.

Expanding its presence into the creative industry, the S.A. Film Academy provides professional training in filmmaking, cinematography, acting, editing, and digital media, preparing aspiring artists for careers in the entertainment and media sectors.

Driven by its commitment to excellence, innovation, and values, the S.A. Institutions continues to shape future leaders, innovators, entrepreneurs, and lifelong learners who contribute meaningfully to society and the nation.
