different in shade, united in purpose

Mutual Funds (MFs) and Specialized Investment Funds (SIFs) perfectly complement each other in achieving a well-rounded and resilient investment portfolio. The balance of long and short positions in your portfolio work harmoniously in balancing risk and reward for a more dynamic and resilient investment strategy. MFs provide potentially steady and long-term growth, while SIFs help capture both long-short opportunities, using derivatives, offering potential gains in both rising and falling markets

FIRST PAGE

The uncomfortable trade

Dhirendra Kumar
Editor-in-chief

After several years of strong equity markets, I suspect many of you are likely sitting on portfolios that look very different from what you intended. A sensible 60:40 split between equity and debt five or six years ago may have pushed you closer to 75:25 or even 80:20. Your portfolio changed without you changing anything. This silent drift is exactly why our cover story focuses on rebalancing, a topic that rarely receives the attention it deserves.

The strange thing about rebalancing is that almost every investor understands the logic. Restore your original allocation. Sell what has risen. Buy what hasn't. Lock in gains. Maintain your risk level. Simple in theory. And yet, when the moment arrives to actually do it, something feels deeply wrong.

Consider what rebalancing asks of you right now. It asks you to sell some of your equity holdings, the very investments that have made you feel like a smart investor, and move that money into debt funds, which feel dull by comparison. Every instinct rebels. Why sell winners? Why shift money from what is working to what isn't? The answer, of course, is that you are not predicting the future; you are managing risk. Knowing this is one thing, feeling it is another.

This is the central challenge of rebalancing. It requires you to act against the grain of your own psychology. When equity markets

are soaring, rebalancing feels like leaving money on the table. When they're crashing, it feels like catching a falling knife. There is no comfortable time to rebalance. **The right moment always feels like the wrong moment.**

I've been writing about investing for three decades now, and I've observed that this psychological barrier is far more significant than any technical complexity. Investors will spend hours researching fund managers, comparing expense ratios, and debating large-cap versus flexi-cap—activities that have a marginal

- Your portfolio can drift over time without you noticing
- Rebalancing helps keep your risk level in check
- The right investment moves often feel uncomfortable

impact on long-term outcomes. But they will avoid the 10-minute task of checking whether their portfolio has drifted from its target allocation, because confronting that drift means confronting an uncomfortable decision.

The financial services industry only makes it harder. There's no commission in telling someone to sell a well-performing fund and buy a boring debt fund. No headlines are written about investors who maintain their asset allocation

through market cycles. The incentives all point toward action, toward new funds, toward the next opportunity. Rebalancing is the opposite of exciting, which is precisely why it works.

What makes this moment particularly important is the extent of the accumulated drift. The equity rally of recent years has been substantial enough that even disciplined investors may find their portfolios carrying significantly more risk than they intended. This isn't a problem when markets continue rising. It becomes a serious problem when they don't. The investor who thinks they have a moderate-risk portfolio but is actually running an aggressive one will discover this mismatch at the worst possible time, during the next significant correction.

Our cover story lays out the mechanics and the evidence. Twenty years of data across eight market cycles make a compelling case. But the mechanics were never the hard part. The hard part is bringing yourself to act on what you know. It means selling something that has made you money to buy something that hasn't. It means trusting a process over a feeling.

The best investment decisions often feel wrong at the moment. That discomfort isn't a sign that you're making a mistake. It's usually a sign that you're doing exactly what you should.

DHIRENDRA KUMAR

The price of free

When a platform offers something for nothing,
ask what it's really selling

A friend called me last week, rather pleased with himself. He had discovered an app that let him invest in mutual funds for free. No subscription, no transaction charges, nothing. “Why would anyone pay for

investing?” he asked, with the confidence of someone who believes he has stumbled upon a life hack that others have inexplicably missed. I didn’t have the heart to tell him immediately, but over the course of our conversation, I

helped him understand something that took me years to fully appreciate: in the world of investment platforms, free is almost never free.

The internet has trained us well. We intuitively understand that when we use a social media platform for free, we become the product. Our attention, our preferences, our behaviours—all of this gets packaged and sold to advertisers. It's an uncomfortable bargain, but at least we know the terms. When Gmail shows us advertisements, we understand the transaction we've agreed to.

Free is the bait

Fintech platforms, however, play a different game altogether. Consider these apps that offer commission-free mutual fund investing. The funds they offer are direct plans, which means no commission flows to the platform from the fund house. There are no subscription fees, no hidden charges on transactions. So how does a business that appears to charge nothing for its primary service manage to keep the lights on?

Your presence
on a free
investing
platform
makes you
something
valuable: a
qualified
prospect

The answer requires you to think not about what they're offering today, but about what they plan to sell you tomorrow.

Your presence on a free investing platform makes you something valuable: a qualified prospect. You've demonstrated that you have money to invest, which means you might have money to spend on other financial products. Today, it's mutual funds; tomorrow, it could be stock trading, with its inevitable push towards futures and options, where retail investors routinely lose money while platforms collect transaction fees. The day after, perhaps a personal loan against your portfolio, or an insurance policy, or access to portfolio management services dressed up as exclusive 'wealth management' for the aspiring affluent.

The free mutual fund offering isn't the business. It's the bait.

There's an even more troubling pattern that has become common. Some platforms present visitors with a choice when they navigate to the mutual fund section: a free option or a paid subscription. To most people, this seems obvious—why pay when you can get something for free? What they don't realise is that the free option routes them into regular plans, where the fund house pays the platform a commission that comes directly out of the investor's returns. The paid option, usually a modest flat fee, provides access to direct plans with lower expense ratios. Over time, that seemingly small difference in expense ratios compounds into a substantial erosion of wealth. The platform knows this. It's counting on you not knowing it.

This is what thoughtful observers call a dark pattern—a design choice that appears to benefit the user but actually exploits their natural tendencies. We're wired to avoid paying for something that looks free. These platforms weaponise that instinct against us. The investor who clicks 'free' walks away feeling clever about saving money, never realising they've signed up for higher costs that will quietly diminish their returns for years to come.

I bring this up not to suggest that all fintech platforms are predatory. Many have genuinely democratised access to investing and offer real convenience. But there's a

Illustration: ANAND

fundamental question every investor should ask: whose interests does this platform's business model serve?

A platform built on alignment

This question leads me to ask why we built Value Research Fund Advisor the way we did and why it operates so differently from the new breed of fintech platforms.

Value Research has been around for over three decades. We didn't emerge from a startup accelerator with venture capital money that needs to be returned at enormous multiples. We weren't built to grow fast, monetise aggressively, and exit to a larger buyer. We're a self-funded, profitable company that has spent 30 years doing one thing: helping Indian investors make better decisions. Our business model is almost boringly simple—we charge a transparent fee for our services, and in return, we work entirely in your interest.

This might sound unremarkable, but in

today's landscape of hidden incentives and misaligned interests, it's actually quite rare. When we recommend a fund, it's because our analysts believe it serves your goals, not because we earn more commission from that recommendation. When we suggest you stay the course during market volatility, it's because our experience tells us that patience pays, not because keeping you invested generates fees for us. Our interests and yours are genuinely aligned, and that alignment isn't a marketing claim—it's the inevitable result of how we've structured our business.

The trust that lakhs of investors have placed in Value Research over the years wasn't built through clever marketing or aggressive customer acquisition. It was built slowly, through tens of market cycles, through honest recommendations that sometimes meant telling people what they didn't want to hear, through being there when other platforms disappeared or pivoted to whatever was

What you actually get

When you pay for something, you deserve to know exactly what you're paying for. No hidden agendas, no cross-selling traps, no bait-and-switch. Here's what **Value Research Fund Advisor** puts in your hands.

fashionable. We've seen the dot-com crash, the 2008 financial crisis, the pandemic market upheaval and countless smaller storms. Each of these taught us something about what Indian investors actually need—not what they can be sold, and what genuinely serves their financial futures.

Value Research Fund Advisor is the expression of everything we've learned. It's a platform designed around how Indian families actually invest—across generations, with intertwined goals, and with existing portfolios that need intelligent management rather than a fresh start. Every subscription covers up to six family members at no extra cost, because we know that investing in India is a family endeavour. Our Portfolio Planner tool creates personalised investment strategies based on your actual circumstances, not generic recommendations. Our Analyst's Choice represents funds we genuinely believe in, selected through rigorous analysis rather than

Fund Advisor is designed around how Indian families actually invest across generations, with intertwined goals and with existing portfolios

commercial arrangements.

When you import your existing investments, our system doesn't just record them—it analyses them, identifies what's working and what isn't, and suggests improvements aligned with your goals. Our continuous re-evaluation ensures your portfolio stays relevant as markets shift and your circumstances evolve. And when you're ready to act, direct transaction capabilities let you implement changes immediately, in commission-free direct plans.

All of this for a transparent fee that you can see upfront—no hidden charges, no commission-based recommendations, no ulterior motives. At ₹499 to start, you can experience everything we offer. If it works for you, continue. If it doesn't, you've risked very little.

In a world where free often costs you dearly, there's something refreshing about simply paying for what you get. That's the bargain we offer, and it's one we've honoured for three decades. ☑

All of this for a fee you can see upfront: ₹499 for your first month, then choose between quarterly and annual plans. No commissions shaping our recommendations. No premium products waiting to be upsold. Just a service that works for you because that's the only way it works for us.

Advice and action in one place

Start a SIP, exit a weak fund, switch from regular to direct—it all happens seamlessly on the platform. No logging into separate systems, no paperwork, no momentum lost between knowing and doing.

Fund Advisor Live

When you're stuck, ask us directly. Our fund research team answers your specific questions every month—no theatrics, no sales pitch, just practical guidance in plain language.

Your whole family, one subscription

Cover up to six family members at no extra cost, because investing in India has always been a family affair.

*Total equity assets of all actively managed mutual funds. Data based on portfolio disclosures of November 2025 and December 2025. Passive funds have been excluded. Worth of shares bought and sold is based on month-end stock prices.

A multi-tasker for your portfolio

Multi Asset Allocation Funds.

In volatile markets, diversification across multiple asset classes can help lower overall portfolio risk. Multi Asset Allocation Funds spread your investment across asset classes like **Equity, Debt, Gold/Silver ETFs, etc.** Fund managers keep track of market changes and shift weightages towards better performing assets, aiming to generate better risk-adjusted returns for you.

Benefits of Multi Asset Allocation Funds

Managing Market Cycles

Responds quickly to macroeconomic and market changes by adjusting allocations to help capitalize on market trends.

Reducing Risk

Diversifying across various asset classes helps mitigate the impact of any one asset's fall in performance on the overall portfolio thus lowering risk.

Optimizing Returns

By investing across asset classes, Multi Asset Allocation Funds tap into multiple sources thereby enhancing overall portfolio performance.

An investor education and awareness initiative.

Letters to the Editor's Note

Your responses to the editorial, 'The system is rigged for you to fail'

Dhirendra Kumar's Editor's Note, *The system is rigged for you to fail*, published on January 31, 2026, examined how the personal finance industry profits from confusion rather than clarity. Drawing on recent academic research, he argued that complexity is often designed to mislead, not help, investors.

The piece resonated strongly with readers who recognised how easily simple financial needs are buried under jargon, features and incentives misaligned with their long-term interests.

Aditya Roy/AI-generated image

Summary

Once in a while, a book comes along that articulates exactly what you've been thinking for years. *Fixed: Why Personal Finance is Broken and How to Make It Work For Everyone* is precisely such a book. It offers rigorous academic validation of a truth observant investors already suspect: the personal finance system is not an accident; it is designed that way. The title carries a double meaning. Personal finance is "fixed" because it is broken, and "fixed" because it is rigged. The authors show that the financial services industry does not profit despite your mistakes; it profits

because of them. This is not a conspiracy, but outcome of markets responding to confused demand.

Capitalism works brilliantly when consumers understand quality and price. But when people are blind to costs and confused by benefits, competition delivers products with exaggerated promises and hidden fees. The authors call this "phishing for phools." Complexity becomes a sales tool, not a sign of quality. A simple term plan earns modest commissions, while complicated products earn far more, making them far more attractive to sell.

The book likens personal finance to medicine before regulation, when

quackery thrived alongside genuine cures. While the comparison has limits, the core insight stands: complex financial products that can harm households are freely sold, while simple, useful ones struggle because they are less profitable.

So what should investors do? The answer is radical simplicity. Complexity is not your friend. Every extra feature is an opportunity for costs to hide and interests to diverge. A term plan for protection, a few well-chosen mutual funds for investing, and the discipline to ignore everything else. The system may be rigged, but recognising that is the first step to not being its victim.

[READERS' VOICE]

What our readers say

I fully agree with your honest and transparent opinion on personal finance, capitalism and related issues. I feel the system itself is deeply corrupt.

Many so-called financial advisors misguide or mis-sell to unsuspecting investors purely for material gain—particularly by pushing “guaranteed return” products. I’ve often felt that

financial education should be taught as a compulsory subject at the higher secondary level, alongside students’ chosen disciplines. As you rightly said, investing should be kept simple: a term policy for protection and well-chosen mutual fund investments, within sensible asset allocation limits.

Ponnudurai Ratna

I completely resonate with your views. Simple is underrated and complex is overrated. The most powerful personal finance strategies often appear simple, which is why they’re frequently overlooked. But simple does not mean easy—this is something I repeatedly emphasise to my clients during our monthly calls.

As a mutual fund distributor, I’ve seen this play out many times. One of my senior citizen clients routinely returns from bank visits with proposals for “market-linked investment-cum-insurance” plans. He checks with me before proceeding, but despite repeated

explanations about features and hidden costs, he often forgets due to age and becomes vulnerable to aggressive sales pitches from younger bank staff. Fortunately, his children have now advised him to consult them or me before taking any decision. I agree that waiting for systemic reform is unwise and that investors must protect themselves. But the question remains—for how long? Little has changed since my days at a major private bank in the mid-2000s. The pressure to cross-sell and upsell remains just as intense today.

Arun Sundar Dhinakaran

That’s how most personal finance professionals are trained to run their business. Complexity and jargon are believed to generate faster profits.

People forget that impatience is rarely rewarded, while patience, discipline and commitment usually are. Unfortunately, many believe that complex AI-driven financial tools can deliver

miracles. Until investors accept that volatility is normal, the system will remain unstable. Greed, fear and impatience remain the enemies of genuine investors across generations. One real concern is the lack of simplicity even in life and medical insurance policies, which should be designed for elderly and genuine users.

Arvind P

This article was a sharp briefing on the present investment ecosystem. I’ve burnt my fingers several times. Banks have increasingly become middlemen for fund houses rather than focusing on core banking. Many people selling policies are absolutely clueless. The worst hit are those nearing retirement or already retired—they are the prime targets for such mis-selling.

Shankar Mitra

Personal finance also has its share of crooked operators who push predefined agendas while quietly benefiting from them. Today’s personal finance journalism often appears to operate on quid pro quo arrangements. That said, one should not blame the entire sales fraternity.

Dilip Raj

Ignorance earns higher commissions for agents. I came to know the term “term plan” only at the age of 50. So-called friends, relatives and colleagues sold me ULIPs and money-back policies instead.

Even mutual fund agents often push NFOs that have no proven performance.

Hina Joshi

Does diversifying beyond mutual funds make sense?

We examine the pros and cons of other investments and give our verdict

By Siddhant Madhav Joshi

‘**M**utual funds sahi hai’ is a sentiment echoed by many young Indian investors today. They are cost-effective and offer diversification, liquidity, scalability and regulation—advantages few asset classes can match. However, as portfolios grow, you may wonder: “Is this all? Should I look beyond mutual funds?”

The appeal of branching out is understandable. But the real test for any alternative investment is not novelty or sophistication, it’s whether it improves long-term returns or meaningfully reduces risk. Here, we examine popular options beyond mutual funds to help you decide if they deserve a place in your portfolio.

The right way to evaluate alternatives

Before you decide to invest in an alternate asset class, it is important to ask: Does the asset enhance long-term returns relative to equity mutual funds? Does it provide meaningful diversification during downturns? How liquid is it? And, how predictable are its outcomes once costs, taxation, structure and investor behaviour are accounted for?

Using this framework, here is how popular alternatives stack up.

How REITs held up in recent corrections

Though they fell less than the broader market, REITs fail to provide complete hedge against downturns

Embassy Office Parks REIT used for its longest track record across all three drawdowns. Drawdowns are when Nifty 500 TRI fell over 15 per cent since 2019.

Gold and silver

Gold and silver are the default alternatives for many. They’re liquid, accessible and perceived as safe. During periods of turmoil, the yellow metal has often delivered strong returns and capital protection.

But over longer horizons, the picture dims. As shown in the graph ‘Gold shields during bad times, but lags in the long run’, gold’s 10-year returns have lagged equity mutual funds more than 62 per cent of the time over the last 20 years. Silver has fared worse, adding volatility without reliable diversification.

So, a combined gold and silver allocation of up to 10 per cent may serve as a hedge when the market is falling, but not as a driver of long-term wealth.

Real Estate Investment Trusts (REITs)

REITs offer affordable, liquid exposure to real estate, with diversification and regular cash flows. However, they behave more like yield-focused equities than safe-haven assets. Prices react sharply to interest rates, leverage and market sentiment. In rising-rate cycles, REITs often see capital losses even when payouts are stable (see ‘How REITs held up in recent corrections’).

Gold shields during bad times, but lags in the long run

10-year rolling returns prove equities do better than gold and silver for the most part

Data from June 30, 2005 to December 31, 2025 considered.

Alternate assets vs Mutual funds: A snapshot

How popular alternative asset classes stack up against mutual funds

Asset class	Primary role	Long-term return potential vs mutual funds	Downside protection during market corrections	Liquidity & exit flexibility	Tax efficiency vs mutual funds
Gold	Hedge against equity	Lower	Yes (especially during sharp drawdowns)	High	Physical: Worse ETF: Similar
Silver	Tactical exposure	Lower and inconsistent	Limited	High	Physical: Worse ETF: Similar
REITs	Diversification and constant cashflow	Comparable	Partial	Medium	Similar
PMS	Concentrated active allocation	Inconsistent across the category	No	High	Worse
SIFs	Strategy-driven equity exposure	Unproven due to limited history	Untested	Medium (currently)	Similar
AIF Category I & II	Diversification in unlisted category	Higher potential, uneven outcomes	Strategy-dependent	Very low	Worse

Our verdict? REITs work as satellite income allocations, not as replacements for debt funds or reliable portfolio stabilisers during market stress.

Portfolio Management Services (PMS)

PMS strategies are high-conviction, fund manager-driven portfolios. A few have outperformed over time, but consistency is rare.

Results depend heavily on the manager's stock-picking skill, and concentrated bets mean deeper drawdowns. Taxation also hurts. In PMS, portfolio churn is taxed immediately at the investor level, unlike mutual funds, where tax applies only when the investor actually sells their units.

Thus, PMS may work for a narrow set of investors with high risk tolerance, patience and the ability to identify skilled managers early.

Specialised Investment Funds (SIFs)

SIFs try to bridge the gap between regular mutual funds and PMS, offering fund managers greater flexibility while retaining regulatory oversight.

Given that the category came into existence only in 2025, it is too early to judge if SIFs have delivered or will deliver over time. On paper, the flexibility afforded to fund managers allows SIFs to pursue strategies that may offer better downside protection during corrections than equity funds. Whether this promise translates into consistent real-world outcomes will become clearer only as the category is tested across multiple market cycles.

For now, SIFs suit investors who understand the strategy and can tolerate uneven outcomes. They complement diversified equity mutual funds, but do not replace them.

Alternative Investment Funds (AIFs)

Category I and II AIFs, covering venture capital, private equity, and private credit, offer investors opportunities unavailable in public markets.

However, they come with steep tradeoffs: lock-ins, uncertain cash flows, limited exit options and low transparency. Although an illiquidity premium exists, it is uneven and highly manager-dependent.

Hence, AIFs are suitable only for those with substantial surplus capital and long-time horizons, albeit with small, deliberate allocations.

So, should you expand beyond mutual funds?

As portfolios grow, complexity often rises faster than returns. Most alternate assets shift risk rather than reduce it. The biggest gains still come from disciplined asset allocation, diversification across equity styles, and staying invested through market cycles.

Mutual funds continue to do the heavy lifting in wealth creation. They remain liquid, transparent, tax-efficient and scalable across life stages, forming the portfolio core even at higher wealth levels. Alternate assets are optional tools, not markers of financial progress. Used thoughtfully, they can support a portfolio. Used aspirationally, they usually complicate it. [☑](#)

[INSURANCE BASICS]

Do you really need term insurance riders?

Riders promise extra protection, but only a few truly help your family

By Siddhant Madhav Joshi

Term insurance works because it is simple. You pay a modest premium so that your family is financially sound even if you are no longer around.

Yet, a product meant to be straightforward often leaves policyholders uncertain. Words such as return of premium, accidental benefit and income riders promise 'extra protection' but can instead blur decision-making. What should have been a clear choice becomes a bundle of add-ons, leaving the policy anything but simple.

Though not all riders are inherently flawed, many do little to improve financial security and merely raise costs. Some overlap with protection better handled by other specified products. The challenge is knowing which riders actually add value and which simply complicate a product that works best when kept clean.

Riders that actually add value

A few riders address risks that can weaken the insurance itself or protect against financially disruptive events.

Waiver of premium. This rider ensures the policy continues even if an illness or disability disrupts income. Although triggered by predefined conditions, its objective is narrow and clear: to prevent the policy from lapsing during financial stress. For primary earners with dependants, this can meaningfully strengthen protection.

Accidental total and permanent disability rider.

Sometimes, disability can be even more financially damaging than death. Income may stop while expenses rise and persist for years. This rider provides a payout if an accident results in permanent and total disability, helping offset the loss of earning capacity. The payout is typically a lumpsum, often linked to the rider sum assured and, in some cases, aligned with the base cover.

Income benefit rider. Some families may struggle to manage a large lumpsum prudently. In these situations, an income benefit rider is ideal. It provides steady payouts, offering stability. However, this may not be useful for everyone. Suitability depends on family structure and financial capability.

Vinayak Pathak/AI-generated image

Riders that sound useful but can be disappointing

Critical illness rider. Critical illness riders are often restrictive and expensive. Coverage is time-limited, claims trigger only at advanced stages of disease and premiums can be disproportionately high. In the accelerated version of the rider, payouts reduce the base life cover, weakening the very protection term insurance is meant to provide. In such cases, health insurance is better suited.

Accidental death benefit. Death from any cause is already covered under a term plan. If the sum assured is adequate, this rider rarely changes outcomes and is often driven by emotional comfort rather than real risk protection.

Return of premium. This appeals to the fear of 'wasted premiums' but significantly raises costs and blurs the line between insurance and savings. Buying pure term insurance and investing the difference is usually the wiser choice.

Keeping term insurance true to its purpose

The strength of term insurance lies in clarity. Riders should be added only when they address a specific, well-understood risk. In insurance, restraint often delivers better outcomes than over-engineering. ☒

Madcap micro caps

Hot index returns mask challenges of liquidity, churn and real execution

By Abhishek Rana

The new year began on a sobering note for India's only fund tracking micro-cap stocks. Motilal Oswal Nifty Microcap 250 Index Fund paused accepting fresh inflows in January 2026 citing regulatory constraints while stressing this had nothing to do with performance or liquidity stress.

The pause, it said, came to comply with SEBI rules because under the regulator's market-cap classification, companies beyond the 250th rank fall under the small-cap category with no formal recognition of micro caps as a separate segment.

Launched in July 2023, the fund began life modestly, gathering just about ₹120 crore. But as investor hunger for India's smallest stocks caught fire, the fund's assets ballooned to ₹2,626 crore by December 31, 2025.

Thus the pause calls for a timely discussion on the underlying index itself. The Nifty Microcap 250 index has delivered eye-popping returns on paper. In practice, it comes with a set of risks that are easy to underestimate, especially when markets are rising and returns look irresistible.

Before unpacking those risks, let's first understand what exactly this index represents.

Inside the Nifty Microcap 250

The Nifty Microcap 250 index sits at the far end of India's market-cap spectrum. It comprises 250 companies ranked from 501 to 750 by market capitalisation—those that fall outside the Nifty 500 universe. The National Stock Exchange labels these stocks "micro caps".

There is, however, a regulatory wrinkle. SEBI does not formally recognise micro caps as a distinct market-cap category. Under its framework, companies beyond the top 250 are all classified as small caps. Micro caps exist more as a market construct than a regulatory one: an important distinction that partly explains the fund house's decision to halt inflows.

Despite being home to some of the smallest listed firms, the index is not a chaotic jumble. Sectorally, it is reasonably diversified. The top five sectors together account for about 54 per cent of the index weight. Capital goods dominates, with close to a 20 per cent share, followed by financial services at roughly 10 per cent.

Mukul Ojha/AI-generated image

Small but mighty

Nifty Microcap 250 index has outpaced large-, mid- and small-cap indices across all time periods

Index	Rolling returns (% pa)			
	3 years	5 years	7 years	10 years
Nifty 100	13.9	13.9	12.9	12.4
Nifty Midcap 150	20.1	19.3	17.1	16.4
Nifty Smallcap 250	18.1	16.8	14.1	13.5
Nifty Microcap 250	25.3	23.2	19.0	17.6

Data as of January 23, 2026. Total Return Index (TRI) considered. Average returns have been calculated based on rolling returns from the base date of the micro-cap index.

FUND RADAR

Where the index really stands out, though, is performance.

The table 'Small but mighty' shows the index has handily beaten its bigger peers over longer periods of time. Over three, five, seven and ten-year rolling periods, its returns tower over those of large-, mid- and small-cap indices.

Strong returns, however, tell only part of the story. Alongside these impressive numbers come a distinct set of risks that rarely show up in glossy return charts but matter deeply in the real world.

The risks beneath the returns

Poor liquidity. Liquidity steadily thins as one moves down the market-cap ladder. What looks like a technical detail quickly becomes a defining constraint for funds investing in smaller stocks.

At low asset levels, liquidity issues are manageable. A fund can deploy money without moving prices too much and exit positions without causing undue disruption. But as assets grow, as they did rapidly in Motilal Oswal's

micro-cap fund, trading in relatively illiquid stocks becomes harder. Buying and selling in stocks with thin trading volumes starts to affect prices. Over time, this friction can weigh on outcomes even if index returns look impressive on paper.

More importantly, liquidity has a habit of disappearing precisely when it is needed most: during market stress.

To understand how this plays out across market cycles, we analysed trading volumes between 2021 and 2025. Stocks were classified every six months, June and December, into large-, mid-, small- and micro-cap buckets based on their market capitalisation. Each stock retained its classification until the next rebalancing date to avoid distortions from daily price movements.

We then identified different market phases by tracking each segment's index:

Bearish phase: When the index fell more than 15 per cent

Recovery phase: When the index climbed back to its previous peak

Bullish phase: When the index rose to new highs

For each category, we calculated average daily trading volumes for all months within each phase. This showed how different groups of stocks typically trade in good times and bad.

The data reveals that micro-cap stocks, which already trade at much lower volumes in normal times, see their liquidity shrink even further when markets crash, making them harder to exit precisely when you need to sell the most. See 'Liquidity has a pecking order'.

Higher churn. Next, micro caps are not just less liquid but also short-lived. In other words, they survive less. The micro-cap index experiences a much higher degree of churn than larger market-cap categories, making it harder to replicate. To quantify this, we did the below exercise.

First, we ranked all stocks by market capitalisation every six months—in June and December—from 2017 to 2020. The top 100 were classified as large caps, 101-250 as mid caps, 251-500 as small caps and 501-750 as micro caps.

Second, we tracked where these companies stood five years later to see how many were promoted, demoted or stayed in the same segment. A stock was counted as promoted if it climbed the ranks to a higher market-cap segment. Those that fell in ranks to lower segments were counted as demoted. Those that remained within their original category despite rank changes within that segment were counted as stagnant. For instance, a stock that was a large-cap in June 2017 but slipped into the mid-cap segment by June 2022 was counted as demoted.

Liquidity has a pecking order

Micro caps trade thinly in normal times and far worse during market downturns

Category	Average daily volume in 000's		
	Bull	Bear	Recovery
Large	 18,337	 8,046	 10,243
Mid	 19,837	 16,082	 12,853
Small	 7,191	 4,903	 5,959
Micro	 5,692	 3,364	 3,854

Liquidity analysis covers 2021–25. Stocks grouped by market cap using June/December data and kept in that bucket until next rebalancing. Phases are bear (>15% fall), recovery and bull, with average volumes by phase.

In micro caps, only a few stay the course

Micro caps show the weakest stickiness over five-year periods and the highest one-year turnover

Segment	No. of stocks over a five-year period			Average 1 year churn (%)
	Promoted	Stagnant	Demoted	
Large-cap	– 	70 	30 	13 
Mid-cap	20 	69 	61 	22 
Small-cap	28 	93 	129 	26 
Micro-cap	31 	61 	158 	36 

Stocks were ranked by market capitalisation in June and December for each year from 2017 to 2020. Companies were classified as large-cap (top 100), mid-cap (ranked 101–250), small-cap (ranked 251–500) and micro-cap (ranked 501–750). Each stock's market-cap segment was then tracked five years later to classify it as promoted, demoted or stagnant. Results are averaged across rolling five-year periods.

This exercise was repeated on a five-year rolling basis starting from each six-month classification point. So, stocks were tracked from June 2017 to June 2022, then December 2017 to December 2022 and so on. Finally, we averaged the results across these overlapping five-year periods.

The findings highlight just how fleeting micro-cap status is. See table titled 'In micro caps, only a few stay the course'. As we move down the market-cap ladder, the number of companies staying in the same segment over the next five years steadily declines. While around 70 per cent of large-cap stocks remained large caps, only 24 per cent of micro caps, on average, managed to stay in their segment. In fact, nearly 63 per cent were demoted over the next five years.

Not just that, they enter and exit the index far more frequently than other segments. On a one-year rolling basis, their average churn rate was 36 per cent, much higher than other broad-based indices.

For an index fund, this is a nightmare. High turnover means frequent buying and selling, higher trading costs and greater scope for slippage. This shows why replicating the micro-cap index is much harder, the impact of which is explained in detail in the next point. **High tracking error.** Tracking error captures the difference between what an index promises and what a fund actually delivers. In segments where stocks are liquid and stable, this gap tends to be small. But in areas where buying and selling stocks is harder, such as microcaps, low liquidity, frequent reshuffles, and higher trading costs make the gap much wider.

As of December 31, 2025, the Motilal Oswal Nifty

Microcap 250 Index Fund reported a tracking error of 0.63 per cent. That may not sound dramatic until it is placed in context.

Funds tracking the Nifty 50 TRI or Nifty 100 TRI typically show tracking errors of around 0.09 per cent. Even mid- and small-cap index funds do better with average tracking errors of about 0.18 per cent.

The difference reflects everything that makes micro-caps tricky: thin liquidity, frequent reshuffles and higher implicit trading costs. Over long periods, these gaps compound.

More volatility. If liquidity and churn are structural risks, volatility is the emotional one.

Five-year rolling return data since 2010 shows a clear pattern: as one moves from large caps to micro caps, volatility rises sharply, lowest possible returns worsen and negative periods become more frequent.

Micro caps have delivered negative five-year returns in over 12 per cent of periods, far higher than any other segment. Their standard deviation is also significantly higher, underscoring the wild swings investors must endure.

During full-blown market crashes, the picture is starker. In 2008, the micro-cap index plunged about 82 per cent from peak to trough, deeper than even the small-cap index. During the Covid sell-off, micro caps fell nearly 70 per cent.

They fall harder, recover later. And they test investor patience unlike other segments.

The final word

The Nifty Microcap 250 index is a reminder that spectacular numbers often come bundled with

Powering
India's
financial future.

Introducing

**CANARA ROBECO BANKING AND
FINANCIAL SERVICES FUND**

(An open-ended equity scheme investing in Banking and
Financial Services Sector)

New Fund Offer Opens on: February 27th, 2026

New Fund Offer Closes on: March 13th, 2026

Scheme Re-opens for continuous sale and repurchase on : Within 5 business days from the allotment date

This product is suitable for investors who are seeking*

- Long term capital appreciation
- Investments predominantly in equity and equity related instruments of entities engaged in banking and financial services sector.

Scheme Riskometer

Benchmark Riskometer[#]

*Investors should consult their financial advisers, if in doubt about whether the product is suitable for them.

The above product labelling assigned during the New Fund Offer (NFO) is based on internal assessment of the scheme characteristics or model portfolio and the same may vary post NFO when the actual investments are made.

[#]The benchmark riskometer is based on the evaluation of the portfolio data as of 30th January, 2026.

Mutual Fund investments are subject to market risks, read all scheme related documents carefully.

[FUND RADAR]

Unstable by nature

Even across five-year periods, the micro-cap index remains more volatile and loss-prone

Index	Min return (% p.a.)	Instances of negative return (% of time)	Standard deviation (%)
Nifty 100	-0.7	0.0	4.8
Nifty Midcap 150	-2.3	0.9	7.7
Nifty Smallcap 250	-6.2	7.5	9.4
Nifty Microcap 250	-11.9	12.4	14.2

Data based on five-year rolling returns from January 2010 to January 2026. Total Return Indices (TRI) considered.

uncomfortable realities. On paper, the index dazzles. In practice, translating those numbers into real-world outcomes is far more complicated.

Index returns assume a frictionless world—instant execution, infinite liquidity and seamless rebalancing. Funds operate in a very different environment. In the micro-cap universe, liquidity is thin even in good times and tends to vanish when markets turn volatile. Stocks churn rapidly in and out of the index, forcing frequent trading. Costs add up. Tracking error widens. Volatility tests patience.

Each of these frictions may appear modest in isolation, but together they can create a meaningful gap between what an index promises and what an investor actually experiences.

This is not to dismiss the segment. Over long periods, micro-caps have outperformed every larger market-cap peer. But that outperformance comes at a price: sharper drawdowns, longer recovery times and a far greater dependence on market conditions. The journey matters as much as the destination.

That makes micro caps a niche allocation, not a core holding. This corner of the market is best suited to investors with a high risk appetite, a long time horizon and the temperament to endure deep and frequent bouts of volatility.

Even then, prudence demands restraint. If investors still wish to participate in this segment, (when avenues are available), it is wiser to do so with a small allocation, while keeping the bulk of the portfolio anchored in large- and mid-cap equities that offer greater liquidity, stability and downside defence.

In micro caps, the rewards can be substantial but so can the risks. Understanding the difference between index mathematics and market reality is not optional here. It is the price of admission. ☒

I invested for my daughter's dreams, not just marriage

Why planning for freedom matters as much as planning for celebrations

When my daughter Ananya turned seven, my mother-in-law handed me a fixed deposit receipt. "This is for her wedding," she said warmly. I thanked her, but something about that moment stayed with me.

Later that evening, I found Ananya drawing a "flying library" that could deliver books to remote areas. When I asked what she wanted to do when she grew up, she replied, "I want to build things that help people, Maa."

There I was planning for one day in her life, while she was imagining an entire lifetime of possibilities. Why was I saving only for her wedding when I hadn't started investing for her education, ambitions, or independence? That realisation changed everything.

What if Ananya wanted to study abroad? Start her own company? Explore the world? The fixed deposit was a thoughtful gesture, but planning only for tradition wasn't enough.

So, I started an SIP with a broader purpose. I wanted to create a financial foundation for whatever path Ananya chose: higher education, entrepreneurship, travel, or even marriage. I began small, with an amount I could commit to comfortably each month. As my income grew, I gradually increased

my contributions.

As Ananya grew older, I included her in these conversations. On her 16th birthday, I showed her the portfolio. "Maa, this could pay for my architecture degree," she said, her eyes wide with excitement.

Exactly. The choice would be hers and that freedom was what I was truly investing in.

This journey taught me that saving only for marriage limits how we imagine our daughters' futures. Even

modest monthly contributions can grow into meaningful wealth over time. Compounding works powerfully, if you give it the years.

Including Ananya in financial discussions also gave her knowledge that she will use for the rest of her life. She learned how investments grow and why financial independence matters.

Planning for my daughter's complete future didn't mean abandoning tradition. With the right mix of investments, a well-structured portfolio can support both education and celebrations. The goal was never to choose one over the other; it was to create options.

Conclusion

Financial planning begins by widening our vision. Starting early and investing consistently through mutual funds may allow compounding to create a substantial corpus over time. This gives young women the financial foundation they need to pursue their aspirations. Our daughters deserve investments that reflect the full range of their potential, not just one anticipated event. When families plan for complete futures rather than only weddings, they affirm their belief in limitless possibilities and empower women with true freedom of choice. 

Key takeaways

- Plan for your daughter's education, independence and aspirations, not just her wedding
- Investing is about having a long-term vision for goals that may unfold over time
- Start early to allow compounding to build meaningful wealth

Mutual Fund investors need to complete the Know Your Customer (KYC) process, which can be done by submitting completed KYC Form along with the required documents at any AMC's branch Office or Official Points of Acceptance. Please refer <https://www.licmf.com/kyc-redressal> to know about KYC documentary requirement, procedure for change of address, phone number, bank details etc. The investors are cautioned to invest only with SEBI registered Mutual Funds, the details of which can be verified on SEBI's website under 'Intermediaries / Market Infrastructure Institutions' (<https://www.sebi.gov.in/intermediaries.html>.) For any complaints and grievance redressal, investors can contact the Investor Relations Officer of the respective AMC and if not satisfied with the resolution given by the AMC, he/she can approach SEBI by registering the complaint on SEBI SCORES Portal (<https://scores.sebi.gov.in/>) and/or escalate the complaint through Online Dispute Resolution Portal (<https://smartodr.in/login>).

MUTUAL FUND INVESTMENTS ARE SUBJECT TO MARKET RISKS, READ ALL SCHEME RELATED DOCUMENTS CAREFULLY.

Budget 2026 Roundtable

What the Budget got right and where it disappointed

Recent Union Budgets have often been defined by surprise announcements. Against that backdrop, Budget 2026 felt restrained, even underwhelming, to many investors. Yet the most important signals were not in what the Budget announced, but in what lay beneath the surface.

Value Research's Budget Roundtable brought together seasoned investment professionals to look past the headline reactions and examine what the Budget implies for investors. The discussion converged on a clear view: the Budget reinforces India's long-term framework, but does little to ease near-term market pressures.

Stability without new triggers

From a macro perspective, the Budget is hard to fault. Fiscal consolidation remains on track, public capital expenditure is sustained, and strategic priorities such as manufacturing, energy transition and capacity building continue to receive policy backing. The commitment to discipline is visible and deliberate.

However, markets had begun to hope for more. Sandeep Tandon, Founder and CIO of Quant Mutual Fund, noted that expectations had built up in the days leading up to the Budget, as foreign institutional investors remained one-way sellers and the rupee

weakened. There was a hope, not an expectation, that the government would take steps on sovereign and pension fund participation, long-term capital and taxation. That hope was not fulfilled.

The outcome is not panic, but paralysis. As several panellists noted, the downside for markets now appears contained, but so does the upside. India's long-term appeal remains intact, yet the Budget did little to improve its relative positioning for global capital at a time when such comparisons matter most.

STT and the risk to market efficiency

The sharpest post-Budget debate centred on the hike in securities transaction tax (STT). While positioned as a curb on excessive speculation, the measure raised broader concerns.

Higher transaction costs are expected to structurally compress arbitrage returns, affecting not just specific strategies but overall market liquidity. Arbitrage plays a key role in keeping prices aligned across segments, and weakening these mechanisms risks reducing efficiency rather than selectively targeting excess.

The concern, as one panellist put it, is that in trying to discourage speculation, the market may end up penalising participation more widely. The impact is

likely to be felt most in volumes and liquidity, not merely in speculative behaviour.

Manufacturing intent is clear, timelines are not

Where the Budget earns credibility is in its consistency. Manufacturing remains a central pillar, with continued policy support across electronics, semiconductors, biopharma, capital goods and clean energy.

That said, the discussion clearly separated intent from execution timelines. Jitendra Sriram of Baroda BNP Paribas AMC highlighted that advanced manufacturing areas such as semiconductors are strategically important but inherently long-gestation. Sectors like textiles, capital goods and sports goods are far more likely to translate policy support into earnings within a visible timeframe.

Announcements around tax stability for AI data centres and nuclear power were seen as directionally positive. These are capital-intensive sectors where continuity matters more than incremental incentives. The signal is constructive, even if the payoff will take time.

Financial market reform remains unfinished

The announcement of a High-Level Committee on banking and financial sector reforms was met with cautious realism. The ambition to deepen capital markets and reduce the cost of capital is neither new nor controversial. Execution remains the challenge.

India's corporate bond market continues to struggle beyond the highest credit tiers. Structural distortions persist, including the dominance of sovereign and PSU borrowing, limited appetite for lower-rated paper, and the continued attractiveness of guaranteed small savings schemes. Incremental

reforms may improve functioning at the margin, but panellists were clear that meaningful change will require addressing these deeper constraints.

Investor sentiment holds, but patience will be tested

For investors, the near-term

< **Jitendra Sriram**
Senior Fund Manager,
Baroda BNP Paribas

Union Budget 2026

Title Associate

multi asset, multi manager

concern is sentiment rather than structure. Market returns over the past year have been uneven, and sustained foreign outflows add to uncertainty. Any further pressure on near-term performance risks tests confidence, especially among newer investors.

Akhil Chaturvedi of Motilal Oswal AMC pointed out that while domestic flows remain steady, sustained underperformance inevitably raises questions. SIP discipline has held so far, but the next few quarters will be critical.

Encouragingly, earnings visibility is improving. Large-cap earnings appear stable, supported by margins and base effects. Beneath the surface, mid- and small-cap segments have already seen meaningful stock-level corrections, creating selective opportunities for investors willing to differentiate rather than chase themes. This is not an environment for broad optimism, but neither is it one of distress.

How investors should read this Budget

The most useful takeaway from the roundtable was not about specific Budget measures, but about investor response. This is not a phase for sweeping allocation changes or reactive positioning. Nor is it a moment to chase momentum.

The Budget reinforces a familiar truth: returns will be driven by earnings and execution, not announcements. Sector selection, stock differentiation and staggered deployment matter far more than binary calls. India's long-term investment case remains intact, anchored by fiscal discipline and structural growth drivers. The near term may remain uneven, but the foundation has not weakened.

The bottom line

Budget 2026 is an exercise in restraint. It strengthens the long-term narrative but offers limited comfort to markets seeking immediate triggers. For investors, the task is not to react to the Budget, but to navigate what follows with patience and selectivity.

Your investing tax guide

Taxation across asset classes, explained

By Siddhant Madhav Joshi

Understanding asset taxation does not require memorising every provision of the income tax act. What investors need is a simple framework to classify any investment and determine its post-tax outcome before committing capital. This guide aims to provide that framework.

For each asset class, this guide answers four essential questions:

- What will be taxed? Whether capital gains, interest income, or periodic distributions?
- When will tax apply? On sale, on payouts, or both?
- How long should you hold? Or the minimum period for long-term classification
- What the applicable tax rate is for short-term and long-term gains

Equity and equity-oriented instruments

Equity investments include listed equity shares, equity-oriented mutual funds (including equity index funds and ETFs), and equity-oriented hybrid funds, which maintain a minimum gross allocation of 65 per cent in domestic equity shares.

Capital gains tax applies only when an investor sells or redeems the investment. Dividends, meanwhile, are taxed separately at the investor's applicable income tax slab rate. If an equity investment is sold within 12 months of purchase, a short-term capital gains tax of 20 per cent

Aditya Roy/AI-generated image

applies. When held for more than 12 months, long-term capital gains tax of 12.5 per cent is levied but only on gains exceeding ₹1.25 lakh in a financial year.

This tax treatment, however, applies only to domestic equity mutual funds. Mutual funds that invest exclusively in international equities are not classified as domestic equity funds for tax purposes. In such funds, gains are taxed at 12.5 per cent if the units are sold after two years from the date of investment. If the units are sold within two years, the entire gain is added to the investor's income and taxed according to the applicable slab rate. As with domestic funds, no tax is payable as long as the units continue to be held.

Debt and fixed income instruments

Debt instruments represent the lending side of the capital market. Their taxation reflects two distinct approaches: instruments where

returns are driven by interest and taxed as income, and those where returns arise from price appreciation and are taxed as capital gains.

A. Interest-driven fixed income products: Traditional fixed income products generate returns primarily through interest accrual. These instruments are taxed annually on the interest earned rather than on capital appreciation. As a result, the tax liability arises each year regardless of withdrawal.

This category includes bank fixed deposits, recurring deposits, post office savings schemes, corporate bonds, government securities, and debentures, excluding market-linked debentures. Interest income from these instruments is classified as 'income from other sources', added to the investor's total income and taxed at the applicable slab rate, which can range from 5 per cent to 30 per cent

depending on overall income. Note that some old government-bonds continue to enjoy exemption from tax on interest income until maturity. Separately, banks and companies deduct tax at source (TDS) on interest once it crosses specified thresholds. Any excess

Illustrations: ANAND

TDS deducted can be claimed back while filing the income tax return.

B. Debt mutual funds, debt ETFs, and non-equity hybrid funds: This category includes debt mutual funds, debt exchange-traded funds (ETFs), and hybrid funds with an equity allocation of below 35 per cent. The taxation of debt mutual funds has undergone significant changes following Budget 2023 and Budget 2024, with the removal of preferential long-term capital gains treatment for most investors.

For debt mutual fund units purchased on or after April 1, 2023, all gains are treated as short-term capital gains, irrespective of how long the investment is held. In effect, the holding period no longer matters for tax purposes. The gains are taxed at the investor's applicable income-tax slab rate, with no long-term tax benefit and no indexation. Debt fund taxation, therefore, now closely mirrors that of fixed deposits. But remember that tax in this case is payable only when the units are sold or redeemed, not on an accrual basis, unlike interest from fixed income products.

The rules, meanwhile, are different for debt fund units purchased before April 1, 2023, which continue to enjoy limited grandfathering benefits. For these older investments, the distinction between short-term and long-term holding still applies. If the units are sold within 24 months, the gains are treated as short-term and taxed at slab rates. If the units are sold after 24 months, the gains qualify as long-term and taxed at 12.5 per cent.

Gold and precious metals

Gold investments span multiple formats, each with distinct tax implications. The choice of wrapper significantly affects tax outcomes despite identical underlying exposure to gold prices.

A. Physical gold, silver and digital gold: Physical gold and silver include jewellery, coins, bars, and digital gold purchased through approved platforms. These are treated as capital assets with taxation arising on both purchase and sale.

At the time of purchase, a goods and services tax (GST) of 3 per cent is levied on the value of gold or silver. In the case of jewellery, making charges also attract GST typically at an effective rate of around 5 per cent.

Capital gains arise when the asset is sold and are taxed based on the holding period. A holding period of up to 24 months is treated as short term, with gains taxed at the investor's applicable income tax slab rate. Holdings beyond 24 months qualify as long term and are taxed at a flat rate of 12.5 per cent.

In the case of inherited gold or silver, the cost of acquisition and the holding period of the original owner are used for tax computation. No separate inheritance tax on such assets is

levied in India.

Note that gold and silver fund-of-funds, as well as hybrid funds with an equity exposure between 35 and 65 per cent, follow the same tax treatment as physical gold or silver. However, unlike physical holdings, no GST is levied on their purchase or sale.

B. Gold and silver ETFs: Gold exchange-traded funds (ETFs) track the price of physical gold and are traded on stock exchanges. For tax purposes, however, gold ETFs are classified as non-equity instruments, despite being market-traded. This category also includes listed silver ETFs.

Capital gains arise only when the units are sold or redeemed. If the holding period is up to 12 months, the gains are treated as short term and taxed at the investor's applicable income tax slab rate. For holdings beyond 12 months, the gains are taxed at a flat rate of 12.5 per cent. As these ETFs are treated as non-equity instruments, they are not eligible for the ₹1.25 lakh long-term capital gains exemption that applies to equity investments.

C. Sovereign gold bonds (SGBs): Sovereign gold bonds (SGBs) are government securities denominated in grams of gold, issued by the

Reserve Bank of India. They represent government debt backed by gold and carry unique tax benefits unavailable to other gold investment formats. The

government stopped issuing new SGBs in February 2024 but existing bonds remain active until maturity. SGBs pay 2.5 per cent annual interest on the issue price, paid semi-annually. This interest income is treated as 'income from other sources' and taxed at the investor's applicable income tax slab rate.

Taxation also applies on redemption. But the treatment depends on how and when the bond is exited. SGBs have a maturity of eight years from the date of issuance, with an option for premature redemption from the fifth year onwards. As per the new rules notified in Budget 2026, only for original subscribers who purchased the bonds at the time of initial issuance, capital gains on redemption at maturity are fully exempt from tax. Bonds purchased from the secondary market do not qualify for this exemption anymore even if they are held till maturity.

Any SGB sold/redeemed before maturity attracts capital gains tax based on the holding period. A holding period up to 12 months is treated as short term and taxed at applicable slab rates. Long-term holding of beyond 12 months attracts a flat 12.5 per cent tax.

Real estate and property

Taxation of real estate operates on two fronts: rental income earned during the holding period and capital gains arising on sale or transfer.

A. Land and buildings (residential and commercial): Immovable property includes land, residential houses, apartments, commercial buildings, and industrial structures. Agricultural land in urban areas and vacant land also

fall under this category. Taxation applies to both periodic rental income and capital gains on eventual sale.

Rental income is taxed as 'income from house property' at slab rates after allowing a standard deduction of 30 per cent for property maintenance.

Interest paid on housing loans is also eligible for deduction only if the old tax regime is opted for.

Capital gains arise at the time of sale or transfer. A holding period of up to 24 months from the date of registration is treated as short term, with gains added to total income and taxed at the applicable slab rates. Holdings beyond 24 months qualify as long term, with gains taxed at a flat 12.5 per cent, without indexation

benefit. Note that properties acquired before July 23, 2024, however, are subject to transitional relief. Resident individuals and Hindu Undivided Families (HUFs) can choose between two options: a tax rate of 12.5 per cent without indexation, or 20 per cent with indexation benefits using the Cost Inflation Index. The option that results in a lower tax liability may be selected. For properties purchased on or after July 23, 2024, only the 12.5 per cent rate without indexation applies.

Capital gains exemptions: The Income Tax Act allows investors to avoid or reduce capital gains tax on property sales if the sale proceeds

are reinvested in specified assets within prescribed timelines.

If you sell a residential property and use the capital gains to buy another residential house, or construct one within the allowed time, the capital gains tax can be fully or partly avoided. This relief is available if the new house is bought within one year before or two years after the sale, or constructed within three years. If you sell any long-term asset other than a residential house, such as land or commercial property, and reinvest the sale proceeds in a residential house, similar relief is available, subject to conditions.

Alternatively, capital gains from a property sale can be invested in specified bonds issued by government-backed entities such as the National Highways Authority of India or the Rural Electrification Corporation. The amount invested in these bonds is exempt from capital gains tax, subject to a maximum of ₹50 lakh, provided the investment is made within six months of sale and held for five years.

These exemptions require careful adherence to prescribed timelines and conditions. Where only a portion of the sale proceeds are reinvested, the exemption on capital gains is available proportionally.

B. Real estate investment trusts (REITs) and infrastructure investment trusts (InvITs): REITs and InvITs combine features of both equity and debt. While their units are traded like shares, investors also receive periodic cash distributions similar to dividends. As a result, their taxation falls in two dimensions: on distributions received during the holding period and capital gains

arising on the sale of units.

Taxation of distributions: REITs and InvITs operate under a pass-through taxation framework, under which income retains its original character as it flows from the trust to the unitholder. Each component of the distribution is therefore taxed differently, depending on its nature.

Interest income distributed by the trust is taxed under the 'income from other sources' head and added to the investor's total income. It is taxed at the applicable slab rate, with tax deducted at source (TDS) at 10 per cent for resident investors.

Dividend income is taxed based on whether the underlying special purpose vehicle (SPV) has opted for the concessional corporate tax regime (which allows companies to pay a lower tax rate if they give up certain deductions and

exemptions). If the SPV has opted for this lower tax option, dividends received by unitholders are taxed at their applicable slab rate, with 10 per cent TDS. If the SPV has not opted for this concessional regime, dividends are exempt from tax in the hands of the unitholder.

Return of capital (a payout of your original investment, not income) is not immediately taxable but reduces the cost of acquisition for future capital gains computation.

To enable correct tax reporting, REITs and InvITs provide a detailed break-up of distributions in Form 64B, which investors should rely on for accurate classification.

Taxation of capital gains on unit sale: Capital gains arising from the sale of REIT and InvIT units are taxed separately from distributions. For capital gains purposes, these units are treated as listed securities. A holding period of up to 12 months is

considered short term, with gains taxed at a flat rate of 20 per cent. Holdings beyond 12 months qualify as long term. Long-term capital gains are taxed at 12.5 per cent on gains exceeding ₹1.25 lakh in a financial year, with gains up to ₹1.25 lakh remaining exempt.

Remember

Taxes don't just shape returns at the time of exit. They shape outcomes from the moment an investment is chosen. Knowing how different products are taxed helps investors avoid surprises and keep more of what they earn.

Remember that similar investments can be taxed very differently, holding periods are not uniform, and tax rule changes in recent years have reduced or removed long-term tax advantages in several categories.

Factoring in these realities early can lead to better decisions and post-tax returns. 

Tax summary across asset classes

Asset class	Short-term holding period	STCG tax	Long-term holding period	LTCG tax
Equity shares, equity mutual funds, equity ETFs, equity-oriented hybrid funds	Up to 12 months	20 per cent	More than 12 months	12.5 per cent on gains above ₹1.25 lakh
Bank FDs, RDs, post office schemes, bonds and debentures	Not applicable	Interest taxed at slab rates every year	Not applicable	Not applicable
Debt mutual funds, debt ETFs, non-equity hybrid funds (units bought on or after April 1, 2023)	Not applicable	Slab rates (all gains treated as short-term)	Not applicable	Not applicable
Debt mutual funds, debt ETFs, non-equity hybrid funds (units bought before April 1, 2023)	Up to 24 months	Slab rates	More than 24 months	12.5 per cent
Physical gold, silver, digital gold, gold FoFs and hybrid funds (>=35% and <65% equity exposure)	Up to 24 months	Slab rates	More than 24 months	12.5 per cent
Gold and silver ETFs	Up to 12 months	Slab rates	More than 12 months	12.5 per cent
Sovereign gold bonds (sold before maturity)	Up to 12 months	Slab rates	More than 12 months	12.5 per cent
Sovereign gold bonds (held till maturity by original subscriber)	Not applicable	Not applicable	8 years	Fully exempt
Residential and commercial property	Up to 24 months	Slab rates	More than 24 months	12.5 per cent
REITs and InvITs (listed units)	Up to 12 months	20 per cent	More than 12 months	12.5 per cent on gains above ₹1.25 lakh

Break up with your regular plan

Direct plans justify the switch. We examine what holds back investors.

Mukul Ojha/AI-generated image

By Abhishek Rana

Two investors can own the same mutual fund with the same portfolios and yet walk away with different returns. Not necessarily because one took more risk or timed the market better but because one paid more to stay invested. That's what investors staying in regular plans usually do. For the same fund, they pay a higher cost.

At first glance, the expense gap looks modest, even ignorable. A few basis points here, a fraction of a percentage there. But investing often turns small, persistent costs into large, permanent drags. And the rule of compounding ensures that what looks

unnoticeable early on rarely stays that way.

In this story, we look at how a seemingly minor cost difference between regular and direct plans can quietly eat into long-term returns, when switching to direct plans makes sense and when it doesn't. But first, let's unpack what really distinguishes the two.

Same fund, different bill

The difference between regular and direct plan isn't in what the fund owns or how it is run. It's in the route you take to invest and the bill that comes with it.

In a regular plan, you invest through an intermediary such as a mutual fund distributor, bank or online

One tax hit. Years of saving.

A one-time capital gains tax looks painful upfront but lower costs help the direct plan pull ahead over time

Continuing with regular plan		Switch to direct plan
SIP started in: January 2006		
Corpus after 10 years: ₹35 lakh		
-	Tax paid (₹ lakh)	1.8
	Net investment (₹ lakh)	
-	Time required to breakeven (years)	4.8
	Final corpus (₹ cr)	

Assumes a monthly SIP of ₹10,000 starting January 2006 in the regular plan of an average flexi-cap fund, with a 10 per cent annual step-up. Capital gains tax was calculated at 12.5 per cent for units held over one year (after accounting for the ₹1.25 lakh exemption) and 20 per cent for units held for one year or less. Final corpus values are as of January 28, 2026.

platform. The fund house pays a commission to this intermediary for selling and servicing the product. This cost is not billed separately; instead it is embedded in the regular plan's expense ratio (as a service charge) and quietly deducted from the scheme's returns.

Before 2013, all funds were regular plans and thus the extra charge could not be bypassed. That changed in 2013 when SEBI made it mandatory for all mutual fund schemes to offer a direct plan. By skipping the middle person, direct plans avoid commission costs, carry lower expense ratios and leave investors with slightly higher returns. Note that investors in direct plans are not upgrading to a better fund but are simply paying less for the same one.

If direct plans are simply a cheaper way to own the same fund, you'd expect regular plans to have faded into the background by now. They haven't. A large number of investors continue to invest through them, guided by beliefs that are somewhat seemingly reasonable. But when examined over time, they don't always hold up.

Here are the assumptions that hold investors back from switching to direct plans, and why they fall short.

What keeps investors in regular plans

1. 'I'd rather avoid the tax hit'. For investors who began their mutual fund journey before direct plans arrived in 2013 or started investing based on the recommendations of a fund distributor (MFD), switching can feel like opening a Pandora's box of taxes.

Moving from a regular to a direct plan is counted as a sale transaction and thus redeeming units triggers capital gains tax. For portfolios built over years, the tax outgo can look large enough to discourage any action. This fear isn't misplaced but incomplete.

While the tax is a one-time hit, the savings from a lower expense ratio is recurring. Over time, those annual savings add up and in many cases, even recover the tax paid within a few years. Beyond that breakeven point, the extra returns are simply the reward for paying lower fees.

Let's say an investor started a monthly SIP of ₹10,000 in the regular plan of an average flexi-cap fund 20 years ago with a 10 per cent annual step-up.

After 10 years, the corpus grew to ₹35 lakh. At this point, the investor faced a choice: pay capital gains tax and switch to the direct plan, or do nothing and continue with the regular plan. The table 'One tax hit. Years of savings' compares how these two decisions would have unfolded over time based on current tax rules (because capital gains tax did not exist for a majority of the time).

As the table shows, the investor who switched to the direct plan would have had to pay ₹1.8 lakh in capital gains tax (as per current tax rules) and reinvest the remaining ₹33.2 lakh with all future SIPs also routed into the direct plan. Because of this upfront tax hit, the direct-plan portfolio initially lags the continuing regular plan portfolio.

But over time, things reverse. By November 2020, the direct plan catches up; this is the breakeven point. From there on, the lower expense ratio does its quiet work and the gap steadily widens. By January 28, 2026, the direct plan ends up with nearly ₹10 lakh more than the regular plan despite taking the initial tax hit at the time of switching.

In short, while the tax is loud and immediate, the cost saving is quiet and persistent. And it's usually the quiet one that wins over time.

2. 'A few percentage points won't make much difference'. On paper, a few basis points might look harmless, barely worth a second glance. And over short periods, they mostly are. That's why many investors

The slow bite of higher fees

A 1 per cent higher expense ratio means your regular plan ends up with a much smaller corpus

Portfolio value: ● Regular plan ● Direct plan

Assumes annual returns of 12% before expenses on a monthly SIP of ₹10,000. Expense ratios are assumed at 0.5% for direct plans and 1.5% for regular plans.

shrug and stick with regular plans, assuming the extra cost won't move the needle much.

But investing isn't a short sprint; it's a long marathon. Over years, that tiny cost-gap starts compounding. What begins as a rounding error gradually turns into a meaningful gap in the final corpus. The graph 'The slow bite of higher fees' shows this: the difference stays modest in early years but the longer you stay invested, the wider the gap grows.

3. 'Switching is complicated'. For many investors, switching from regular to direct plans feels like opening a box of paperwork and follow-ups. That fear is largely outdated. With better technology and simpler processes, making the switch today is far easier than most assume.

Platforms now offer a simple 'switch' option, allowing investors to move from a regular plan to the direct plan of the same fund in one go. Even where this isn't available, the process is straightforward—redeem the regular plan, reinvest the amount into the direct plan and restart the SIP in the new plan. It's a one-time exercise and can usually be done online.

The Portfolio Analysis feature in the Value Research Fund Advisor mobile app allows investors to easily spot regular-plan investments and switch to direct plans in just a few clicks.

In short, the effort involved in switching is small and temporary. The cost of not switching, on the other hand, can keep compounding quietly for years.

So far, we've looked at why the most common arguments for staying in regular plans feel right at first but age poorly over time. But investing is rarely one-size-fits-all. In some situations, staying with a regular plan could make more sense. Here's when that might be the case.

When sticking with regular plans makes sense

1. You're getting advice that adds value. If your distributor is more than just a transaction facilitator, helping you with asset allocation, keeping you invested during market falls and stopping you from making costly knee-jerk moves, then the extra cost of a regular plan may be money well spent. Good advice can save far more than it costs. But if the relationship begins and ends with an annual statement, paying an ongoing fee for it makes little sense. In that case, switching to a direct plan is simply aligning costs with reality.

2. Switching isn't simply possible. In some cases, switching may not even be an option. Certain funds especially in the international space have paused fresh inflows (due to RBI limits). Since moving from a regular to a direct plan involves redeeming and reinvesting, investors may be unable to enter the direct plan at all. Here, staying put isn't a preference; it's a necessity.

To sum up

Switching from a regular plan to a direct one is simply about paying a lower price for the same one. While the tax hit at the time of switching feels immediate and uncomfortable, note that it's an unavoidable one-time cost. The savings from a lower expense ratio compounds quietly year after year.

That doesn't mean regular plans are never useful. If a distributor's advice genuinely helps you stay invested, manage asset allocation and avoid costly mistakes, the higher cost may be worth paying for. But when advice adds little beyond convenience, continuing with a regular plan is often just inertia at work. ☑

[COVER STORY]

Buy **Low** Sell **High** Automatically

By Pranit Mathur

There is much investors can learn from India's best defender on the pitch. Rahul Dravid built his legend on defence but even 'The Wall' knew that blocking every ball was a slow way to lose a match. Surviving did not mean complete inaction but adjusting to conditions: defending patiently, rotating the strike and stepping out when the moment demanded.

Similarly, the sacred rule of 'Invest and forget', while sound advice no doubt, becomes a problem when confused with passivity. Because while you may sit back, your portfolio rarely does. Markets move, winners grow bulkier and asset allocations drift away from the balance you once chose deliberately. Bull runs especially make this drift look like skill even as risk accumulates unnoticed.

This is where rebalancing comes in. It is the investing equivalent of rotating the strike: small, disciplined adjustments to a portfolio that keep the innings on track and risks controlled. It is not activity for its own sake but the act of restoring balance you always aimed for. Because a good investor like a good defender knows when to be patient and when to adjust just enough to stay in control. By the end of this story, you will hopefully know how to get this balance right. But first, let's begin from the beginning.

Rebalancing, stripped to basics

You start by deciding how you want your money split across broad buckets. Equity for growth. Debt for stability. Perhaps a small allocation elsewhere,

“The risk-return trade-off is the crossroad between greed and fear that shapes human behaviour in financial markets. As we all know, the wealth creation process also includes wealth preservation, hence the need to strive for optimisation and not maximisation.

Krishna Sanghavi

CIO-Equity, Mahindra Manulife Mutual Fund

depending on your needs and your temperament. This split is your target allocation, and it reflects three very personal realities: your goals, your income situation, and your ability to live through market ups and downs without losing sleep or making unforced errors.

Rebalancing is the act of bringing your portfolio back to that target allocation, periodically and deliberately. Nothing more. Nothing clever.

If equity has grown faster than debt and now occupies a larger share than you intended, rebalancing means trimming some equity and moving that money into debt. If markets fall and equity shrinks below your target, rebalancing means adding to equity.

Nowhere in this involves forecasting the market, guessing interest rates, or making brave proclamations about what comes next. Rebalancing simply accepts cycles rather than predicting them.

The slow unravelling of the chosen mix

Without regular checks, your portfolio's asset allocation goes haywire

Analysis based on a lumpsum investment of Rs 1 crore made on January 1, 2006, in the regular plans of an average flexi-cap fund and an average short-duration debt fund, allocated equally at 50:50. Rebalancing was done whenever the portfolio split moved 5 per cent or more from the desired allocation. Data up to January 27, 2026. Taxes were not considered.

Rebalanced portfolio flexed better resilience in the recent correction

[COVER STORY]

What rebalancing actually does

Two crucial things. One is ensuring that excessive risk, more than you intended to take in the first place, does not end up destabilising your portfolio. Second, surrendering your portfolio entirely to market forces means you miss out on gains that naturally arise from buying a little low and selling a little high along the way. By periodically re-adjusting, you ensure you do not miss out. Let's address these one by one.

First, **rebalancing resets risk** that unknowingly creeps into your portfolio. When left unchecked, portfolios tend to drift. The graph 'The slow unravelling of the chosen mix' shows how asset allocation changes over time when it remains untouched. As equity grows dominant and debt fades into the background, the portfolio ends up carrying far more risk than originally intended.

So when equity runs up as it often does in long stretches, your original 50:50 split between equity and debt for instance may end up becoming 75:25, without you touching a single rupee.

This does not feel alarming. It often feels comforting. After all, the 'good' asset did well. But rebalancing asks a blunt question: If the cycle turns, would you still be comfortable with the higher risk that the new split carries?

If the answer is no, action follows. Some equity is sold. Debt gets topped up. The portfolio returns to 50:50.

This restoration of balance is what ensures you are cushioned better when the cycle does turn. The recent market fall provides a useful illustration. Portfolios that allowed allocation drift fell much harder than those that kept risk in check. And the difference was meaningful.

Second, **rebalancing grows your portfolio better**. Investors understand, in theory, that money is made

Illustrations: ANAND

The added muscle of rebalancing

A ₹1 crore investment with rebalancing grows larger than without rebalancing

Analysis based on a lumpsum investment of Rs 1 crore made on January 1, 2006, in the regular plans of an average flexi-cap fund and an average short-duration debt fund, allocated equally at 50:50. Rebalancing was done whenever the portfolio split moved 5 per cent or more from the desired allocation. Data up to January 27, 2026. Taxes were not considered.

by buying low and selling high. In practice, behaviour moves the other way. Money flows towards what feels reassuring. Underperforming assets are avoided.

Rebalancing gently pushes against this instinct. It trims assets that have appreciated significantly more than others in your portfolio and adds to those that have gained much less than the rest. By doing this, it locks in some gains from what has run up and moves that money into what has been left behind, keeping the portfolio ready for the next turn.

The graph 'The added muscle of rebalancing' illustrates this through two portfolios. Both start with the same allocation. Both face the same markets. One is left alone. The other is periodically brought back to its intended shape. Over time, a gap emerges. The portfolio that accepted periodic resets ends up ahead of the one that did nothing. This gap simply appears because one portfolio was allowed to change character unchecked while the other was corrected intentionally in small steps.

The point is not that rebalancing guarantees higher wealth but that it improves the odds meaningfully. In essence, portfolios that drift tend to grow less over time and fall more sharply during stress.

Now that it's clear why rebalancing is important, the obvious follow-up question is this: if risk is defined by the allocation you choose (and stick with), how should that allocation be decided in the first place?

[COVER STORY]

What 'your' asset allocation should be

Most investors search for an ideal allocation the way they search for the best mutual fund. They expect a precise answer.

That expectation leads to disappointment.

Asset allocation reflects personal circumstances, not market opinions. It reflects how much uncertainty your life can absorb without pushing you into poor decisions. Thus, our framework in the 'Where are you on the asset allocation map?' visual attempts to answer that by offering ranges over fixed numbers. It uses two variables.

The first is time horizon. A 25-year-old saving for retirement can tolerate sharper swings than a 55-year-old approaching the same goal. The second is risk capacity. Two people of the same age can experience volatility very differently. Income stability, number of dependents and familiarity with market cycles all matter.

Together, these variables show why asset allocation would differ for everyone. High risk appetite and a long investment period allows for a higher tilt towards equity. The lesser the risk appetite and investment horizon, the more reliance on debt. The ideal ratio should eventually reflect a mix that's uniquely suited to your risk tolerance and goals.

Why beginners can ignore rebalancing (for now)

Rebalancing plays a vital role in shaping outcomes over time. But that does not mean it's equally urgent for everyone. For many investors, especially those

Where are you on the allocation map?

A framework to find your uniquely personal fit

just starting out, rebalancing is rarely the most important task.

In the early stages of wealth building, fresh monthly contributions should take priority over everything else. Because this is the stage where being robotic and unconcerned matters the most. The graph 'SIPs make portfolios drift less' shows why.

It compares how portfolios evolve when money is added regularly through SIPs versus invested upfront as a lump sum. SIP-driven portfolios tend to stay closer to their intended allocation, while lump-sum portfolios drift more widely over time.

This happens because rupee cost averaging also performs a rebalancing function. When equities fall, the next instalment buys more equity units; when debt outperforms, new money naturally flows in proportion to the allocation. The portfolio self-corrects a little without conscious effort.

More importantly, early-stage investors have a bigger job at hand: building the habit of investing itself. An excessive focus on rebalancing can distract from the far more powerful driver of long-term wealth: steady, uninterrupted contributions.

But this comfort does not last forever. As portfolios grow and market swings begin to feel larger in rupee terms, the emotional stakes change. Volatility that once felt manageable can suddenly trigger anxiety and waiting until that moment to think about rebalancing may prove costly.

So when does rebalancing go from being optional to essential? It's when a portfolio reaches a size where market moves can meaningfully alter outcomes.

When it stops being optional

There is no single number that works for everyone. But a practical rule of thumb we often use at Value Research is this: begin rebalancing once your

SIPs make portfolios drift less

Regular investments act as a built-in stabiliser

Analysis based on a lumpsum investment made on January 1, 2001 and SIP investments made at the beginning of each month, using the regular plans of an average flexi-cap fund and an average short-duration debt fund in a 50:50 allocation, from January 1, 2000, to January 27, 2026.

portfolio grows to roughly three times your annual expenses. At that stage, a drop of 33 per cent or one-third of your portfolio would equal a year's worth of spending, a loss large enough to change behaviour and test conviction. That is the moment when rebalancing becomes necessary.

The graph 'Your savings rate sets the rebalancing clock' shows how long investors typically take to reach that threshold across different savings rates. Savings rate simply refers to the proportion of income invested regularly. Investors who save and invest more reach this stage sooner and vice-versa.

Your savings rate sets the clock

The more you invest, the faster your portfolio reaches a size where risk starts to bite

Analysis based on SIP investments made at the beginning of each month in the regular plans of an average flexi-cap fund and an average short-duration debt fund, in a 75:25 allocation, from January 1, 2001, to January 27, 2026. Annual expenses are assumed to be equal to $(1 - \text{savings rate})$ while total income is assumed to grow 5 per cent per year.

Thus, it becomes relevant when the portfolio finally has enough weight to hurt you if ignored. Once that milestone is crossed, the question is no longer whether to rebalance but how to do it consistently across changing market cycles. That is what we turn to next, understanding how rebalancing behaves when markets rise, fall and move sideways.

Rebalancing through market cycles

Markets do not move in a straight line. They move in phases, often changing character just when investors grow comfortable. To understand how rebalancing behaves over time, it helps to first define these phases clearly.

Bullish phase: When markets move to new highs from a previous peak, largely trending upward despite interim corrections.

Bearish phase: A sharp fall from peak to trough, typically exceeding 15 per cent.

Recovery phase: The climb from that trough back to the earlier market high.

Together, these three stages form a complete market cycle.

Using this framework, we examined the past 22 years of market data and identified eight distinct market cycles, each made up of these three phases. The table 'Across rallies, falls and recoveries' summarises what happens when rebalancing is applied across each of these cycles.

To keep the comparison clean, we ran a simple thought experiment.

Eight investors enter at the start of different cycles (that begin with the bull phase), each investing ₹1 crore split equally between equity and debt. Portfolios are rebalanced whenever allocation drifts more than five percentage points from the 50:50 mix. At the end of each cycle, the investor exits fully. Each journey stands on its own, shaped only by the market cycle it experiences.

Our table compares final portfolio values with and without rebalancing, highlights the absolute gain or lag, how many times rebalancing was triggered demonstrating how often markets created opportunities to act.

Crucially, it also tallies the excess number of equity and debt fund units held by the rebalanced portfolio compared with the non-rebalanced one. Units are tracked for a simple reason. When markets diverge, rebalancing trims the asset that has surged and adds to the one that has lagged. This works by accumulating more units of the underperforming

COVER STORY

asset at lower prices and releasing some of the outperforming asset at higher ones.

Over time, this builds a stronger net unit position across assets, showing how disciplined rebalancing puts more money to work where it matters most.

How rebalancing tilts the odds

Each market phase affects the portfolio in a different way. During bullish periods, rebalancing trims equity repeatedly. This limits how far equity exposure can run ahead and can result in slightly lower returns during strong rallies.

During bearish phases, the process works in reverse. Debt is pared back and equity is added at lower prices, increasing the number of equity units held. Recovery phases tend to be slower and steadier, which often leads to smaller allocation changes. Even so, portfolios that accumulated more equity units during downturns often emerge stronger once markets reclaim earlier highs.

Across a full market cycle, these small adjustments add up. In five of the eight cycles studied, rebalanced portfolios finished meaningfully ahead of those that were left untouched. In the remaining cycles, the difference was modest. Over multiple cycles, these outcomes compound. That cumulative effect explains

“Rebalancing during market rallies can feel counterproductive, as trimming outperforming assets may limit short-term gains. However, across full market cycles, this discipline adds value by systematically realising gains and reallocating toward relatively undervalued assets. The outcome is more stable, risk-adjusted returns and improved resilience during market downturns.

Devender Singhal

Senior Fund Manager, Kotak Mahindra AMC

the long-term portfolio gap shown earlier in the story. Rebalancing does not rely on predicting market phases. It benefits from the simple fact that markets continue to change direction and character over time.

That said, the process is neither perfect nor failproof. There will be stretches when returns feel underwhelming even when investors believe they have followed every rule correctly.

This is when it helps to remember that the primary benefit of rebalancing lies less in maximising returns

Across rallies, falls and recoveries

A cycle-by-cycle look at outcomes with and without rebalancing

		Market cycles

and more in ensuring the portfolio continues to reflect the asset allocation originally chosen. That helps investors stay invested through turbulence.

And once investors accept the value of rebalancing, a common mistake quickly follows: assuming it needs to be done very frequently.

How often should you rebalance?

Long-time readers will know that we are strong proponents of letting wealth compound quietly in the background. Investing works best when left alone. But rebalancing requires occasional intervention. This is when it's important to assess how often portfolios should be checked and at what point should action be taken.

To answer that, two decisions matter. First, how frequently should rebalancing occur? Second, how much drift from the intended allocation should be tolerated before action is taken? In the table 'How often is too often to rebalance', we examined portfolio

behaviour across different rebalancing thresholds to bring clarity to both.

The analysis looks at a simple 50:50 equity-debt portfolio over the past 20 years, starting with an initial investment of ₹1 crore. Rebalancing is triggered only when the allocation moves beyond a predefined band. That band ranges from a very tight 1 per cent on either side to a very loose 30 per cent. Everything else remains constant.

Too much or too little? Neither works

The first insight from the table is how sensitive outcomes are to the frequency of rebalancing. At very tight bands, rebalancing becomes a near-constant activity. With a 1 per cent band, the portfolio needs to be rebalanced close to 300 times over the period. That works out to more than once a month. Such intensity does not improve outcomes. Returns do not rise meaningfully and drawdowns remain pronounced. The portfolio ends up reacting to minor movements rather than meaningful shifts in risk. This is a clear case of overdiscipline. Activity increases but benefits do not.

At the opposite extreme, wide bands introduce a different problem. When portfolios are allowed to drift by 25 or 30 per cent before any action is taken, rebalancing barely occurs. Equity is allowed to run far ahead during rallies and come to dominate the portfolio. When markets fall, the portfolio behaves much like one that was never rebalanced at all. Volatility rises and drawdowns deepen.

The sweet spot

Between these two extremes lies a narrow but

[COVER STORY]

important middle ground. Leeways in the range of 5 to 15 per cent produce more balanced outcomes. Rebalancing occurs occasionally rather than constantly. The number of interventions drops sharply. Returns remain competitive and drawdowns are contained better than in portfolios that are either left unattended or adjusted too frequently.

The takeaway is simple. Rebalancing works best when it responds to meaningful drift instead of small fluctuations. While excessive precision turns discipline into distraction, neglect allows risk to build quietly.

A well-chosen leeway keeps portfolios aligned with their original intent without demanding constant attention. It allows investors to remain invested, stay calmer through market swings and stay closer to the outcomes they planned for.

That calm, more than any numerical edge, captures the real value of rebalancing.

To sum up: Do less and do it better

By now, rebalancing should appear less like a tactic and more like a temperament. It asks very little of investors. There are no forecasts to make, no bold calls to get right and no clever manoeuvres to execute. What it demands instead is consistency at moments when most people prefer comfort. That demand explains why it tends to work as well as it does.

The biggest benefit of rebalancing rarely shows up on spreadsheets. It shows up in behaviour. Investors who rebalance within a clear system tend to act less at the wrong time. They panic less during sharp falls because their portfolios already carry some buffer. They feel less tempted to chase returns during rallies because gains are periodically set aside. In effect, the portfolio begins to argue on

their behalf, removing the need for emotional decisions at inconvenient moments.

This matters because history shows time and again that most investing mistakes are behavioural rather than analytical. People abandon plans after losses they did not anticipate. They increase risk after gains that feel reassuring. Over time, these reactions compound in ways that are rarely helpful. Rebalancing introduces friction into these impulses. It slows them down and replaces urgency with routine.

There is also a quieter discipline at work. Rebalancing forces investors to revisit their original intent from time to time. Why was this allocation chosen in the first place? What has changed since then? Has income become more stable? Have goals moved closer? Has the portfolio grown large enough to carry real consequences? These questions help keep money aligned with everyday life rather than market headlines.

Remember, rebalancing does not promise perfection. There will be periods when portfolios left untouched look better. There will be rallies where trimming exposure feels premature. There will be long stretches where no action is required at all.

The strength of the system lies in how it behaves across multiple full market cycles rather than isolated moments.

Viewed over time, rebalancing offers something rare in investing. It allows participation in growth while keeping excesses in check. It creates opportunities to add when prices are lower without demanding courage. It encourages trimming risk as it builds, without relying on conviction.

For investors who seek excitement, this approach will feel dull. However, for investors who value endurance, it provides structure. ☑

‘Quality as a factor is now far more widespread’

Shreyash Devalkar on why valuation discipline matters more as quality broadens

After a sharp correction and a year of global underperformance, Shreyash Devalkar believes Indian equities have moved to a more balanced, though still selective, valuation phase. The Head of Equity at Axis Mutual Fund, Devalkar brings over two decades of experience in Indian equities and currently oversees six schemes with assets of around ₹1.21 lakh crore. He joined Axis AMC in 2016 and was elevated to his current role in 2023, after earlier stints at BNP Paribas AMC and IDFC.

Devalkar notes that while headline valuations have eased and India’s premium to emerging markets has moderated, pockets of excess remain, particularly in mid- and small-cap stocks. In a market that has become far more valuation-sensitive, he argues that quality alone is no longer sufficient. With growth broadening across sectors and elevated multiples becoming harder to justify, his focus has shifted to growth at a reasonable price, tighter portfolio concentration and selective capital allocation.

In this conversation, he explains how valuation discipline and sector choices are shaping portfolio outcomes in a more demanding market phase.

After the recent correction, some valuation excesses have eased, but

markets still don't look cheap. How are you reading valuations and the earnings outlook now, and how does that influence your portfolio positioning?

As far as valuations are concerned, the headline valuations of the Nifty have corrected. It is well established that India's underperformance relative to the world, both emerging and developed markets, has been quite significant over the last calendar year. We have underperformed by almost 20 per cent or more in certain markets, especially in US dollar terms.

With that, our valuation premium compared to emerging markets, which had reached nearly 100 per cent at certain points during the post-Covid cycle, has now come down to closer to 60 per cent, which is broadly in line with the 10-year mean. From that point of view, headline valuations look reasonable.

However, if you drill down further into valuations, they are still slightly expensive on both the mid-cap and small-cap sides. Historically, the Nifty Midcap one-year forward P/E is still almost 1.5 to 2 standard deviations above its historical mean. A similar observation holds true for small caps as well.

As you rightly asked about growth and base effects, when we look at valuations and drill down further, we analyse two aspects: growth and valuation re-rating. When I talk about re-rating, I am referring to the multiple compared to pre-Covid levels, which would be somewhere around 2019.

What we observe is that sectors which have not shown growth or have failed to demonstrate meaningful growth have not seen much valuation re-rating. In some

cases, there has even been de-rating. A classic example is the private sector banks, which, as a segment, have been de-rated.

If you look at FMCG and other segments, they have been re-rated by only about 20 per cent. These include staples, PSU banks, consumer discretionary and autos. These segments have seen only around 20 per cent re-rating compared to pre-Covid levels. On the other hand, segments that have shown substantial growth have seen re-rating ranging from 30 per cent to almost 100 per cent. These include capital goods, electric utilities, electrification themes, construction materials, CDMO, space and metal mining.

The broader point I am making is that most fast-growing themes—whether hotels, hospitals, capital goods, electrification, electronics

manufacturing services, and so on—have seen significant re-rating. Even after the recent correction, one cannot call them cheap or attractive from a valuation perspective. On the other hand, segments where growth has been relatively slower appear visually cheaper than pre-Covid levels.

You've often said your core philosophy, anchored in quality, has remained consistent even as markets have changed. How has that philosophy played out across very different phases, from the period of strong Axis performance to the environment we see today?

Our philosophy has remained the same: focus on quality and growth. However, the market environment between 2015 and 2020 was quite different. During that period, multiple factors, including demonetisation, crisis with a certain NBFC and related concerns, as well as relatively high levels of debt in the system, shaped market behaviour. Because of these factors, the market placed a much higher premium on quality compared to the rest of the market. Quality, as a percentage of the overall market, was relatively limited in the classical sense across parameters such as corporate governance, debt levels, management quality, and consistency of growth. Given these parameters, the number of companies capable of delivering was relatively small at the time.

Today, debt levels across the corporate sector are much lower. Corporate governance issues are not as pronounced as they once were. Many new companies are entering the market, and multiple sectors are delivering growth, whereas earlier, only a few did at

INTERVIEW

any given time. As a result, quality as a factor is now far more widespread. Based on basic quality parameters, many companies can be classified as quality businesses. Therefore, this factor is no longer emerging as a disproportionate winner, as it did during that earlier phase.

Across several schemes, relative returns have lagged category peers not just recently, but across multiple market cycles. At a broad level, what do you see as the key reasons for this persistent gap?

Most of the underperformance began emerging during the post-Covid market recovery. A large part of the underperformance occurred in 2022 and 2023, with some impact in 2021 as well. Calendar year 2024, however, was relatively better from a performance standpoint.

In calendar year 2025, there was also a good recovery in performance until around August-September. However, over the last three to four months, we saw sharp corrections across multiple stocks and themes. That phase again eroded a significant portion of the alpha for the full year 2025. Broadly, our investment approach has remained unchanged. As mentioned earlier, 2024 was a good year from a performance standpoint. In 2025, however, the drawdown in the last quarter, driven by sharp falls across multiple themes and sectors, resulted in underperformance.

This included airlines, capital goods, e-commerce, and several other themes, many of which corrected sharply simultaneously. That broad-based correction across multiple segments contributed to the recent underperformance. As a fund house, we continue to focus on

Performance snapshot

Direct plans considered as per VR classification.

quality and growth. However, in this market environment, there has been a much stronger emphasis on growth at a reasonable price. When markets become highly valuation-sensitive, even quality growth stocks can face sharp drawdowns, and that has been a key factor influencing relative performance in recent periods.

Given this experience, have you made any changes to portfolios to improve returns in the future?

Yes. As mentioned earlier, there has been a stronger focus on growth at a reasonable price. This is not new, but over the last year, you will have

In the mid-cap fund, our exposure has been skewed towards large-cap financials rather than mid-cap names

seen us increase exposure to certain segments such as financial services and autos. At the same time, wherever valuations became excessively high, we reduced exposure, particularly in the second half of last year. These changes are visible in the portfolio adjustments we have made.

The third aspect relates to concentration. While the number of stocks in the portfolio may not have changed sharply, if you look at the top five, top 10, top 20, or top 30 holdings, you will see that we have increased concentration over time. This shift has become more apparent in portfolios since last month.

There were periods when mid-cap indices and categories delivered strong returns, but your funds did not fully capture that upside.

In the mid-cap fund, the key point is that the mid-cap universe is very diverse, with multiple segments behaving differently. We have been relatively more positioned towards capital goods and related segments. At the same time, over the last one to one and a half years, we have been underweight banks and financials within the mid- and small-cap space. Some of these mid- and small-cap financials have performed extremely well over the last six to eight months. Our approach to financial services has been to prefer larger, more established names. As a result, even within the mid-cap fund, our exposure has been skewed towards large-cap financials rather than mid-cap names, which was an area where we lagged.

Secondly, our relatively higher exposure to capital goods worked well until around September. After that, the segment saw a sharp

correction, resulting in drawdowns that affected performance. Additionally, certain segments that did well over the last year, such as metal mining, are areas where we traditionally do not carry significant exposure. That, again, contributed to relative underperformance versus the mid-cap category.

These are some of the specific mid-cap-related factors that affected performance during this period. That said, the core focus of the portfolio remains unchanged: investing in businesses with good growth, strong balance sheets, sustainable earnings, and high-quality management. Even in this fund, as in our other strategies, we have been working to make the portfolio more compact. In the current market environment, you can already see some changes in that direction.

Even in schemes like Large & Mid Cap, where you have flexibility, small-cap exposure has remained consistently low. What is the core reasoning behind that, and has your outlook on small caps changed?

In our large & mid-cap fund, and even in our mid-cap fund, small-cap exposure has remained quite low. The reason is not that we are negative on small caps. I would not frame this as a large-, mid-, or small-cap debate. The key point is that very large companies tend to grow broadly in line with nominal GDP growth, because beyond a certain size, it becomes difficult to grow at 1.5 or 2 times GDP on a sustained basis. As a result, growth in the large-cap space tends to be relatively lower, but valuations there are generally more reasonable.

In the mid- and small-cap space, companies benefit from size advantages and often operate in niche segments. In addition, strong themes—such as electrification, EMS, travel, tourism, and related areas—have played out across these segments. As capital repeatedly flowed in, valuations became elevated. Again, this is not about singling out any one market-cap segment. Even within large caps, there can be pockets of excess. The difference is that in the large-cap universe, such excesses tend to be limited to a relatively small portion of the benchmark by weight. In mid and small caps, that proportion is

much higher for the reasons mentioned earlier.

That is why relying purely on market-cap allocation, large versus mid versus small, as a tool to outperform may not be ideal. Instead, capital allocation needs to be selective and anchored around the principle of growth at a reasonable price.

Axis, as a fund house, has historically maintained a largely large-cap-oriented portfolio, even over the past 10-15 years. In recent years, however, we have seen a surge in IPOs and opportunities in the

mid- and small-cap space. Given this backdrop, what factors would lead such companies to find a place in your portfolios?

First and foremost, Axis, as a fund house, runs a dedicated small-cap fund that has performed well across multiple time periods.

This highlights our capability, research depth, and processes for tracking and investing in small-cap stocks. We actively track a large number of companies in the small-cap universe.

If you look at our small-cap fund and even our multi-cap fund, you will see meaningful exposure to small caps. So, it is not that Axis avoids this space altogether. However, in funds with discretion across market capitalisation, the approach is guided more by category discipline than by a top-down call. For example, in large-cap funds, we have largely stayed within large caps. In mid-cap funds, the portfolio has predominantly been mid caps, with some exposure to large caps. This has been a consistent approach over time. Similarly, in a small-cap fund, the portfolio naturally focuses on small-cap stocks.

In diversified categories such as ELSS and flexi-cap funds, we do have exposure to small caps. While we may not have the highest small-cap allocation in these categories, we still have a meaningful presence. So, as a fund house, we do invest in small caps when it fits the scheme's mandate and risk framework.

In short, small-cap inclusion in Axis portfolios is driven by fund mandate, valuation comfort and stock-specific conviction rather than any broad thematic or cyclical push into the category. ☑

‘We expect Nifty earnings to improve into the mid-teens’

The senior fund manager sees an earnings-led upside ahead

After a volatile start to 2026 and an uneven market correction, Shibani Kurian believes Indian equities are entering a more balanced phase, with earnings back in focus. The Senior Fund Manager and Head of Equity Research at Kotak Mutual Fund, Kurian brings over two decades of experience in Indian equity markets and has been with the fund house since 2007. She oversees seven schemes with combined assets of ₹14,784 crore, including the four-star-rated Kotak Focused Fund.

In this interview, Kurian explains

why large and mid caps now offer a more favourable risk-reward than small caps, how muted earnings have shaped valuations over recent quarters, and why disciplined, bottom-up stock selection anchored in earnings visibility remains central to portfolio construction.

Markets have corrected recently, though unevenly across sectors. How are you reading the market at this stage, and has this correction meaningfully changed the opportunity set for investors?

2026 has started off slightly volatile

for our markets. Our view has been that markets are typically driven by three key factors: fundamentals as a starting point, flows and sentiment. Now, before I come to the fundamental aspect of what is happening in the market, in terms of sentiment, there has been considerable uncertainty driven by global geopolitical risks and trade and tariff issues that continue. Added to that, if you look at it from a sentiment perspective, there has been some negative and volatile sentiment, primarily driven by the fact that flows, especially foreign institutional investor flows, in

January have been negative. FIIs have been net sellers to the tune of almost \$3.8 billion, countered by strong domestic flows.

Now, if you look at the market in the context of fundamentals, keeping sentiment and flows aside for the moment, the last six quarters have seen fairly muted earnings growth in Indian markets. That has been one of the reasons why, relative to other markets, India's valuation appeared expensive, especially when viewed in the context of emerging markets. But today, when you look at India, especially given that India has underperformed in the 2025 calendar year and even in January, what we see is that valuations, in relative context to emerging markets, particularly if you look at the premium at which India trades, have come down to long-term average multiples.

The second point is that, from here on, we expect the earnings trajectory to improve. We are in the midst of the third-quarter earnings season, and so far, if you look at the 21 Nifty companies that have reported numbers as we speak, earnings have been largely in line with expectations. Therefore, going into FY27, we expect earnings for Nifty companies to improve closer to the mid-teens.

Now, in that context, when you look at markets today, large caps are trading at reasonable valuations, broadly in line with their long-term averages, so the risk-reward appears favourable. Mid caps, on the other hand, have delivered strong earnings over the last few quarters and have been beating expectations. Therefore, while mid caps trade at multiples above their long-term averages, given the strong earnings profile of the mid-cap segment, we

Fund manager snapshot

see bottom-up opportunities there.

Where we continue to remain cautious is in small caps. Here, earnings delivery has been poor. In fact, if you look at earnings expectations versus actual delivery, there has been a considerable mismatch. Valuations, both absolute and relative to the Nifty, are trading at significantly higher premiums. Therefore, from a portfolio construction perspective, we do expect large and mid caps to be better placed than small caps. Ultimately, for the markets, earnings delivery will be the key driver going forward.

The Kotak Focused Fund has delivered strong outperformance in 2025 after a more mixed phase earlier. How do you assess this period, and what do you think worked

particularly well for the fund?

The philosophy of stock picking has remained consistent in terms of strategy, and we have continued to apply it. Now, remember that when you are running a concentrated strategy, patience becomes very important, both in terms of your conviction and the underlying reasons for buying a particular stock, and in allowing that thesis to play out over time. I think that is what has actually played out in this case.

There can always be a timing mismatch. Of course, you cannot time the entry of a stock in the portfolio to perfection. If adequate research has been done and we have a very strong research team of 17 members who go in-depth into companies and sectors, this portfolio is an outcome of the strong research capabilities at Kotak Mutual Fund. We follow a bottom-up approach across a wide universe of stocks to identify the 30 best ideas, which represent our highest-conviction research ideas.

The fund is a flexi cap, so there is no market-cap constraint. The way we look at portfolio construction is very much aligned with what we discussed earlier, going in depth to understand business quality, earnings capability and management quality. The construction of the portfolio has remained largely along the same lines over time. And as I mentioned, since this is a concentrated strategy, there can be some timing mismatches along the way, but ultimately, the outcome is now there for everyone to see.

Over time, the fund's market-cap exposure has evolved gradually rather than through sharp shifts. How do you think

about market-cap allocation when building and managing a focused portfolio?

So there is an overall house view that we look at across asset allocation strategies, covering large-, mid-, and small-cap strategies. However, the Focused Fund is primarily a bottom-up strategy. Therefore, while managing the portfolio, there is always a thought process about which segments are better positioned at a given point in time, based on earnings visibility and valuations. But that does not mean that we shy away from any particular segment, nor do we assign a specific focus to any market-cap category. It is largely a bottom-up construct, driven by where we find the best ideas.

To explain this a bit differently, the overall Indian equity market comprises more than 5,000 listed stocks. If you narrow that down to companies with a market capitalisation of, say, more than ₹1,000-1,500 crore, the universe reduces to around 1,500 stocks. If you drill down further into our own research universe, as I mentioned earlier, we actively track about 500 stocks, which together account for nearly 85 per cent of India's market capitalisation.

Now, a normal diversified portfolio would typically hold around 55 to 60 stocks on average. From there, we go one step further and distil the best stock ideas, about 25 to 30 stocks, that make it into the Focused Fund. It is almost like distilling gold from ore. These represent the highest-conviction ideas from Kotak as a fund house and from our research team.

Therefore, while we are conscious of which market-cap segments offer better risk-reward at any given time, the portfolio construction itself is

Performance snapshot

Direct plans considered as per VR classification.

entirely bottom-up. The market-cap allocation and the spread across large, mid, and small caps are outcomes of this process, rather than a starting point in portfolio creation.

Interestingly, this gap isn't as pronounced in your Contra Fund, which has taken relatively more exposure to smaller stocks. Could you walk us through the rationale behind this difference in approach between the two funds?

So the contra approach is actually quite different, as we discussed earlier. In contra, the starting point for portfolio creation is the universe of stocks, which are clearly those that have underperformed the index. There are five key criteria we consider in contra. First, the stock should have underperformed the index. Second, it could be a stock trading below its long-term valuation. Third, it could be a stock trading at lower valuation multiples than its peers in the sector. Fourth, it could be a sector that has

underperformed. And fifth, it could be a stock that is trading below its 200-day moving average. A stock we buy in contra must fulfil at least one of these five criteria.

Therefore, if you view the contra as a basket of stocks, the trailing 12-month P/E multiple of the portfolio tends to be in line with, or slightly lower than, the index's trailing 12-month P/E ratio, which, in this case, is the NSE 500. Now, once we have created this initial basket, we apply fundamental filters on business quality and management, and from there we select stocks for the portfolio.

Contra, of course, is a more diversified portfolio. Typically, the number of stocks in the contra has been around 55 to 60. Contra is also a flexi-cap strategy, so there is no specific constraint on market capitalisation. Hence, the approach to stock picking in contra is slightly different from that of the Focused Fund. Focused is more growth-oriented, high-growth and high-quality, whereas contra aims to pick stocks that have typically underperformed but where we see clear triggers for a re-rating.

These triggers could come from changes in business fundamentals, shifts in industry dynamics, or even changes in how management approaches the business. So the approach in contra is truly contrarian. Another important metric to highlight is return on equity. While I spoke earlier about valuations, which reflect the portfolio's value bias, the contra portfolio's ROE has typically been in the 14 to 15 per cent range, which is slightly better than the index's ROE. This indicates that we are buying fundamentally sound stocks that have underperformed for some reason. We are not simply buying

stocks that appear cheap solely on valuation; rather, there needs to be a clear trigger for a re-rating of the multiples of the stocks we own.

The Focused Fund is currently overweight in technology and industrials relative to the category benchmark. Could you share your thinking behind this positioning? Also, given the global concerns around valuations in these sectors, what opportunities are you seeing that give you confidence in this stance?

So let me start with the technology sector first. Here, valuations are reasonable because the sector has gone through its own period of turmoil. Stock selection within the sector is very bottom-up in nature. We have exposure to both large-cap and mid-cap technology stocks in the portfolio, where we believe there are clear triggers for earnings upgrades to play out over the next year to a year and a half.

The second factor from a technology perspective is that, while the sector has underperformed due to concerns about slowing growth, particularly on the top line, we expect to see growth improve going forward. This is especially likely as some of the discretionary technology spending, which has been absent over the last 18 to 24 months, begins to come back. We do not expect a sharp revival like the one we saw during the Covid period, when companies delivered mid-teens earnings growth. However, given the currently muted levels of low single-digit earnings and revenue growth, we do expect an improvement toward higher single-digit growth.

Given that valuations are favourable, the sector currently

offers relatively lower downside risk, along with the potential for multiple re-rating if the earnings growth trajectory and revenue improvement play out as expected. That has been the key rationale for our technology positioning. Once again, this is a very stock-specific exposure, where we focus on selecting the best companies in the sector with scope for improvement in both earnings and valuations.

Your second question was on capital goods. In this segment, we are clearly cognisant of valuations. Here, too, our approach is highly stock-specific. For instance, we are positive on certain sub-segments,

such as defence, where we expect order books to remain strong, driven by robust order inflows and execution capabilities, as well as the power transmission equipment space, amongst others.

Therefore, while capital goods are a segment with somewhat elevated valuation multiples, our exposure is selective. We are investing in companies where we expect earnings growth trajectories and margin profiles to remain stable and strong over the next few years.

After strong outperformance in 2023 and 2024, the Kotak

Contra Fund's margin of outperformance versus the benchmark narrowed in 2025, even as the fund ended the year in the second quartile. How do you interpret this phase of performance, and what were the key factors and contributors during the year?

Our approach remains focused on consistent alpha generation over the benchmark in the medium to long term. As I mentioned earlier, the contra strategy is about identifying, slightly ahead of market movements, stocks that have underperformed but where we expect a change in business dynamics or in the earnings growth trajectory.

Contra, the strategy typically requires a fair amount of patience, because, as market participants, you cannot time everything to perfection. Therefore, you may need to be positioned in a particular stock or sector slightly ahead of time. It naturally takes time for the thesis to play out, given the nature of the strategy and the way it is constructed. As I mentioned, before we buy any stock, we ensure it fulfils at least one of the five criteria we have outlined, as this helps us adhere to the portfolio mandate, which is extremely important. From there, we wait for the re-rating to take place based on our fundamentally driven thesis.

I would also add that this is not unique to contra alone; it is true for most equity strategies. There can be phases of lead and lag, and this can be more pronounced in a contrarian strategy like ours. Over longer periods of time, we have consistently delivered alpha over the benchmark, and that remains our endeavour and objective going forward as well, the caveat being the past performance is not an indicator of future returns. ☑

When the dust settles

Despite near-term noise, long-term performance continues to hold its ground

Data as of January 31, 2026 for BSE indices. Total Return Index (TRI) considered for all indices. Returns of over a year have been annualised.

New kid on the block

Exploring the newly launched Nifty Smallcap 500 index

Index snapshot

Parameter	Details
Launch date	January 23, 2026
Index methodology	Companies selected by total market capitalisation; weights based on free-float market cap
Largest / smallest constituent (market cap, in ₹ cr)	Multi Commodity Exchange of India (64,751) / Hikal (2,411)
Median market capitalisation	₹10,334 cr
Weight of top 10 constituents	10.8%
Top sectors by weight	Financial services (22%), Capital goods (14%), Healthcare (12%)

Source: NSE Factsheets. Market capitalisation data as of Feb 3, 2026.

Small caps have a modest edge over large & mid caps

On a five-year rolling basis, Nifty Smallcap 500 outperformed 51 per cent of time

Data as of February 2026. Returns analysed from the index's base date in 2005. Total Return Index (TRI) considered.

The return-risk trade-off in smallcaps

The index offers stronger long-term returns, but with sharper drawdowns and longer recoveries

Index	Avg. drawdown (%)	Avg. recovery time (days)	Standard deviation - 5Y (%)	Instances of negative return		
				1 year (%)	3 year (%)	5 year (%)
Nifty 100	35.9	347	14.0	17.8	2.9	0
Nifty Midcap 150	39.1	616	16.6	23.9	9.7	0.9
Nifty Smallcap 250	41.5	601	18.4	34.4	17.3	7.4
Nifty Smallcap 500	41.1	512	18.8	33.6	17.8	6.9

Based on periods of 20 per cent or higher declines since 2005. Annualised standard deviation based on daily returns. Negative returns are calculated on a rolling basis. Total Return Index (TRI) considered.

Final verdict

Launched in January 2026, the Nifty Smallcap 500 widens the small-cap universe by tracking 500 stocks ranked 251 to 750 by market cap. Though new, it has a back-tested history from January 2005, showing strong five-year rolling returns and the upside potential of smaller firms.

However, it has also seen sharper volatility, deeper drawdowns and longer recoveries than large- and mid-cap indices. With micro-cap index funds pausing inflows due to classification issues, this index could eventually offer a route into that space once funds launch. However, such exposure is best kept only as a satellite allocation.

A crack in the silver lining

Why the mispricing problem of silver ETFs should not be overlooked

By Abhishek Rana

A good way to gauge how ‘hot’ an asset is at any moment is to consider its trading activity. As volumes jump, what once may have been a quiet corner of the market instead becomes a noisy, one-way trade. That is exactly what has happened with silver or more precisely silver ETFs.

Over the past year, turnover in silver ETFs (total value bought and sold daily) has exploded. In January 2025, average daily turnover sat at ₹4 crore and a year later, it is ₹327 crore. One obvious reason was the metal’s rally. And another was the convenience of ETFs (that can be bought from an exchange just like any share), which made them an investor-favourite.

High activity however becomes a problem even in simple instruments like ETFs when excess demand pushes prices away from the actual value of the underlying metal.

Price is not always value

An ETF has a net asset value or NAV. That is the per-unit value of the assets the fund holds. Then there is the trading or market price on the exchange at which the ETF is bought or sold.

In an ideal world, the market price should sit very close to the NAV. Yet in periods of frenzy, a divergence appears. When demand spikes suddenly, buyers often accept higher prices just to get in quickly. That pushes the ETF above its NAV and results in a premium.

A gold rush in silver

Growing investor interest sharply pushed ETF turnover up as silver rallied

Average daily turnover calculated for each month. *Silver prices rebased to 1,000 as of January 1, 2025.

When sellers dominate, prices slip below NAV and result in a discount. In simple terms, you end up paying more than the silver held by the ETF is worth. Or selling it for less. Both are distortions but they do not hurt investors equally.

How buying at premiums wrecks your returns

Premiums are the bigger danger because they are self-inflicted. You choose to overpay.

Here's how they hurt: We examined the five silver ETFs with the highest-ever one-day premiums and compared their one-week returns from those dates with silver's performance over the same period.

The results in the table 'Too dear to deliver' show how buying at a steep premium wipes returns even when silver itself performs well. The 360 ONE Silver ETF, for instance, traded at around a 14 per cent premium. Over the next week, silver rose 18 per cent. But the investor who'd have bought the ETF at that inflated price earned only about 1 per cent. The missing return did not vanish into thin air. It was simply the premium collapsing back towards NAV.

That is the key point. When excitement cools, the gap between fair and market value tends to close. The investor who paid too much watches part of silver's gain get used up in repairing the entry mistake.

This is why silver ETFs can disappoint even in a rising silver market. If you pay above the NAV, that excess becomes a permanent drag on returns.

Discounts sting, but temporarily

Discounts tell a different story. They often appear after selling pressure, which means investors who entered earlier can be left nursing losses even if silver has not actually fallen.

See table 'Pain precedes discounts'. The top five silver

Too dear to deliver

Buying silver ETFs at premiums drags returns even when silver fares better

Fund	Highest 1-day premium (%)	Date	Next one-week return (%)	
			Silver	ETF
Tata Silver ETF	15.5	Oct 13, 2025	-7.2	-10.9
Kotak Silver ETF	15.1	Dec 29, 2022	-1.6	-16.7
UTI Silver ETF	13.9	Apr 28, 2023	4.2	-7.6
360 ONE Silver ETF	13.7	Jan 19, 2026	18.2	1.1
Bandhan Silver ETF	11.1	Dec 29, 2025	2.1	-8.5

Top 5 ETFs based on highest single-day premium since their launch considered.

Pain precedes discounts

Selling pressure leaves investors with losses before prices return to fair value

Fund	Highest 1-day discount (%)	Date	Previous one-week return (%)	
			Silver	ETF
SBI Silver ETF	-11.6	Jan 30, 2026	5.4	-5.5
DSP Silver ETF	-11.1	Jan 30, 2026	5.4	-5.1
Tata Silver ETF	-11.1	Jan 30, 2026	5.4	3.2
ICICI Pru Silver ETF	-10.7	Jan 30, 2026	5.4	-4.0
Kotak Silver ETF	-10.4	Jan 30, 2026	5.4	-5.1

Top 5 ETFs based on highest single-day discount since their launch considered.

ETFs by the highest one-day discounts, all simultaneously hit on January 30, 2026, fell up to 11.6 per cent below their NAV this day. At first glance, a bargain. But look at the week prior: investors who bought just before this decline were sitting on losses of up to 5.5 per cent even as silver itself gained 5.4 per cent.

Still, discounts are less dangerous than premiums. If you bought when price and NAV aligned, a subsequent discount is merely driven by temporary market dynamics. Over time, prices converge. The mistake is panicking and selling into the discount, crystallising a temporary dip into permanent loss. Premiums, however, are unforgiving. You pay extra upfront and that excess never comes back.

A reality check

Silver's long-term numbers look impressive at 12 per cent per annum from January 2006 to January 2026. But strip out the last year and that 19-year return shrinks to 7 per cent. One blockbuster year did the heavy lifting.

That's how market excitement works. When an asset is flying, it feels eternal. But silver has had quiet phases too. After peaking in April 2011, it plunged 61 per cent over the next four-and-a-half years.

This isn't a warning to avoid silver but a reality check. Some exposure to precious metals can balance a portfolio. But only in small doses. So treat silver exposure as a portfolio ingredient, not a portfolio plan.

What to remember

ETFs are one of the easiest ways to invest in silver but remember to glance at the price tag before buying. When premiums are steep, wait. When discounts appear, don't panic and sell. In markets swept by excitement, the best returns often go not to those who rush in first but to those who enter wisely. ☑

Sapno ko skip nahi, **SIP Karo!**

Dream Car, Dream Holiday, Dream Home... are, in reality, financial goals on our mind which we hold as dreams. But along with these, there also exists a doubt: "How many can I truly achieve, and if I really can?" And so we work hard, investing ourselves into our jobs, so we can make more money and give ourselves a chance of achieving atleast some of the dreams. That's good. But just not enough because every dream is important. So what to do?

To put it simply – Start investing financially through SIP!
Invest your hard-earned money as smartly and systematically as you are yourself invested in your dream.

What is SIP?

Systematic Investment Plan, or SIP as it is called fondly, is a smart, easy and convenient way of investing a fixed amount of money, regularly over a defined period of time. The best part about SIP is its ability to arrest market-related ambiguity, by purchasing more units when the market's low, and vice versa.

SIP is powering

10.29 Crores
folios, helping people
fulfil their dreams!

Source : SIP Accounts as on January 2026

SIP is a good plan in more ways than one!

Inculcates Financial Discipline

Monthly and timely investments make you set aside a fixed sum, which helps you become a Disciplined Investor.

Rupee Cost Averaging

Since the market tends to be cyclic, SIP averages out the cost by buying more units when the market is low and lesser when the market is up.

Power of Compounding

It is like earning interest on interest – so, the longer you stay invested, more you benefit from the Power of Compounding.

Helps in Achieving Financial Goals

The best thing about SIP is that you can go about your financial goals, systematically, without putting a burden on your budgets, through small fixed investments that suits your wallet.

No Need to Time the Market

Since SIP is designed in a way to weather market volatility to the best of its capacity, it helps you counter the stress of timing the market.

Plan for your dreams, systematically, using our SIP Calculator.

- 1** Choose the Amount you want to Invest
- 2** Choose the Time Line for your SIP
- 3** Choose the Investment Tenure
- 4** Select the Rate of Interest
- 5** Hit the "Calculate" Button
- 6** The Calculator will show you the Estimated Returns on your SIP Investment

Further more, your Financial Advisor can guide you through the entire process, in a simple way.

Scan to start calculating your SIP.

Frequently Asked Questions about SIP?

What is an SIP? Why should go for it?

SIP is a planned way to invest in Mutual Funds, on a regular basis.

How to start an SIP?

Easily by answering 3 simple questions: What is your tenure to achieve this Goal? What is your Risk Appetite?

Should I invest directly or through a Financial Advisor

Under Section 80(C) of the Income Tax Act, 1961, investing in Equity Linked Savings Scheme (ELSS) through SIP enables you to claim a deduction of ₹1.5 lakh from your taxable income.

Can investing in SIP also give me Tax Benefit?

Investing through ELSS, Equity Linked Saving schemes gives you Tax Benefits under Section 80C.

What is an ideal investment horizon in an SIP?

This is determined according to your Financial Goals being Short-term: like a Holiday, or Long-term: like a Child's Education.

What kind of returns shall I expect from my SIP?

Simple... the Longer you stay Invested, the Better the Chances of Wealth generation.

How do I stop my SIP and withdraw my money?

Simply by filling a Withdrawal Form, Online or Offline.

When should I start an SIP?

Now! Anytime is a good time to start an SIP.

An investor education and awareness initiative by Kotak Mutual Fund

Visit: <https://www.kotakmf.com/iap-disclaimers/> to know more about the process to complete a one-time Know Your Customer (KYC) requirement to invest in Mutual Funds, procedure w.r.t. change of address, phone number, bank account details, etc. Investors should only deal with registered Mutual Funds, details of which can be verified on the SEBI website (www.sebi.gov.in/intermediaries.html). For any queries, complaints and grievance redressal, investors may reach out to the AMCS and/or Investor Relations Officer. Additionally, investors may also lodge complaints on <https://scores.gov.in> if they are unsatisfied with the resolution given by AMCS. SCORES portal facilitates you to lodge your complaint online with SEBI and subsequently view its status.

NIRMAY CHOKSI

Power of a balanced line-up

Why multifactor strategies deliver more consistent outcomes

Factor investing rests on sound economic logic, but factor returns are inherently cyclical. Leadership shifts as market conditions change, which is why single-factor investing often becomes an unintended timing exercise. Investors tend to chase what has worked recently, only to lose patience when the cycle turns and performance cools.

Different factors lead in different market phases. The graph titled 'Multifactor: Built for all phases' captures this rotation clearly and shows how no single factor consistently leads across all environments.

A cricket analogy makes the idea intuitive. You would not build a team of only Rohits or only Sehwargs and expect consistent wins. A balanced side works better, with different players stepping up as conditions change. Multifactor investing follows the same principle. By combining multiple factors in a rule-based

framework, it reduces reliance on any single market phase and helps investors stay invested as leadership rotates.

Staying invested across regimes

Markets move through broad phases shaped by economic conditions. Recoveries follow periods of stress. Expansions are marked by improving growth and rising risk appetite. Slowdowns emerge as upswing fades, while contractions coincide with economic and market stress.

Identifying these phases accurately in real time is extremely difficult. Yet factor performance is closely tied to them.

Momentum tends to benefit during sustained expansions. Value often performs better during recoveries as pessimism unwinds. Low Volatility usually offers relative protection during slowdowns and contractions. Quality tends to provide resilience across

Multifactor: Built for all phases

Designed to stay resilient across all market regimes

Recovery	Expansion	Slowdown	Contraction
Value (46.8%)	Momentum (26.0%)	Low Volatility (2.4%)	Low Volatility (-10.6%)
Quality (34.7%)	Value (24.2%)	Multifactor (0.8%)	Multifactor (-12.0%)
Multifactor (32.3%)	Multifactor (19.8%)	Quality (0.4%)	Quality (-13.1%)
Low Volatility (27.2%)	Quality (17.3%)	Momentum (0.1%)	Momentum (-16.7%)
Momentum (23.6%)	Low Volatility (16.0%)	Value (-6.8%)	Value (-16.9%)

Source: NJ AMC Internal Research, CMIE, NSE, NJ AMC SmartBeta Research Platform. Factors refer to Nifty 500 (Value 50 TRI, Momentum 50 TRI, Low Volatility 50 TRI, Quality 50 TRI, Multifactor MQVLv 50 TRI). The half-yearly periods from April 2005 to December 2025 are classified into four market phases; the shown returns are the average absolute half-yearly returns for each phase. Past performance may or may not be sustained and is not indicative of future returns.

Better returns for the risk taken

Multifactor offers a better return-risk balance

Source: NJ AMC's Internal Research, CMIE, NSE, NJ AMC's Proprietary SmartBeta Research Platform. Factors refer to Nifty 500 counterparts, namely Nifty 500 Value 50 TRI, Nifty 500 Momentum 50 TRI, Nifty 500 Low Volatility 50 TRI, Nifty 500 Quality 50 TRI, and Nifty 500 Multifactor MQVLV 50 TRI. Data is for the period April 1, 2005 to December 31, 2025.

phases, even if it isn't the top performer in every rally. The regime-wise data below clearly show this rotation. Leadership shifts meaningfully across phases, and no single factor performs well across all environments.

Multifactor strategies are built around this uncertainty. Instead of requiring investors to predict the next regime, they combine factors with different sensitivities so that portfolios can participate more evenly across phases.

Why multifactor strategies deliver steadier outcomes

A simple way to judge consistency is to look at calendar-year performance relative to the broader market. Between April 2005 and December 2025, the multifactor index outperformed the Nifty 500 in 14 out of 21 calendar years, higher than most single-factor indices. More importantly, while several single-factor indices went through sharp spells of relative underperformance, the multifactor index was never the worst performer in any single year. This distinction matters.

Frequent outperformance helps build confidence, but avoiding deep and prolonged underperformance is often more important. Severe underperformance increases the risk of investors exiting at exactly the wrong time.

Multifactor strategies aim to smoothen this

Multifactor stands out for its balance. It combines relatively strong returns with moderate volatility.

experience. When one factor falls out of favour, others often provide support. The result may not translate to leadership in every phase, but a more consistent pattern of performance across cycles, which is easier for investors to stay committed to.

Efficiency matters

Stability alone is not the end goal. Investors ultimately care about how much return they earn for the risk they take. This is where efficiency becomes a useful lens.

The chart titled 'Better returns for the risk taken' illustrates this risk-return trade-off with point-to-point volatility (%) on the x-axis, median rolling five-year returns (%) on the y-axis, and sharpe ratio of factor strategies showing return earned per unit of risk. Low Volatility sits at the lower-risk end with modest returns. Momentum offers stronger returns, but with greater swings. Single factors tend to excel in specific environments and struggle in others.

Multifactor stands out for its balance. It combines relatively strong returns with moderate volatility, resulting in the highest Sharpe ratio (~0.67) as compared to single-factor strategies. By blending factors, multifactor strategies aim to deliver returns more efficiently, making investors' journeys steadier.

Conclusion

Each factor plays a distinct role, but their combination addresses the core challenge of factor investing: market leadership changes frequently and often without warning. Rather than attempting to anticipate these shifts, multifactor strategies are designed to help investors remain invested through them.

At NJ AMC, multifactor investing is approached as a disciplined, rule-based framework rather than a response to recent performance. By focusing on the Quality factor and meaningfully combining it with other factors such as Value, Low Volatility, and Momentum, the strategy seeks to deliver smoother outcomes across market cycles. ☒

RANJIT BHATIA

The temperature check

Why your portfolio needs a thermostat, not a thermometer

It was 3 AM when Rahul checked his portfolio for the seventh time that day. The Indian markets had closed hours ago, but the US markets were open, and his tech-heavy portfolio was down another 2 per cent. He had already moved 15 per cent to cash that afternoon. Should he move more? By morning, he had changed his mind multiple times.

A few weeks later, those same holdings had recovered. But Rahul's portfolio lagged; he had locked in losses and missed the rebound. His problem wasn't that he was measuring his portfolio's temperature. It was that he had no thermostat.

The thermometer trap

How many times last week did you check your portfolio? If you are like most investors, probably more often than you would admit. We have become obsessed with taking our portfolio's temperature, tracking daily swings, refreshing apps, watching every tick.

But here's the paradox: the more you measure, the worse you tend to perform.

Constant monitoring creates an illusion of control. Each check feels responsible. In reality, it exposes us to noise. Daily swings are mostly meaningless, yet our brains treat every dip as danger and every spike as opportunity. Loss aversion kicks in. FOMO follows.

That is why the average equity investor underperforms the market, not because they pick terrible funds, but because they buy when

markets feel safe and sell when fear takes over. A study by Axis Mutual Fund found that from 2003-2022, the average investor underperformed the average equity fund by over 5.3 per cent annually. Consider March 2020. The Nifty plunged more than 30 per cent in a month. Every login felt like a psychological assault. Many investors sold simply because doing nothing felt unbearable. The temperature reading was too frightening to ignore.

But those who exited near the bottom missed what came next, one of the sharpest recoveries in market history. By December 2020, the Nifty hit new highs. By March of next year, it stood at around 15,300.

The thermometer told them the temperature. It didn't tell them what to do about it.

The thermostat solution

Think about your home's air conditioner. You don't walk around with a thermometer checking every room hourly, manually adjusting the temperature each time you feel a little hot. You set a thermostat to keep the ideal temperature between 20 and 22 degrees.

Your portfolio needs the same thing: a thermostat, not a thermometer.

A portfolio thermostat has three components:

- 1. A target allocation** – The desired temperature range. That might be 60 per cent equity, 30 per cent debt, 10 per cent commodities for an investor, depending on their risk appetite.
- 2. Rebalancing bands** – An acceptable deviation

Constant monitoring

creates an illusion of control. Each check feels responsible. In reality, it exposes us to noise.

before action is needed to bring your portfolio back to target. Say, equity markets rallied, and the 60 per cent target became 65 per cent. It would be prudent to rebalance half-way back to target to be in proximity to the desired allocation.

3. Automatic triggers – Rules that execute without emotion. When equity drifts outside its band, you rebalance back to the above desired allocation. No panic, no prediction made, just simple math.

When discipline beats prediction

Here's the mathematical beauty of a thermostat: rebalancing forces you to do what every investor knows they should do but rarely end up doing – buy low and sell high. Not because you are smart and know how to time the market, but because you are systematic. The thermostat helps remove ego and emotion from the equation. It doesn't require you to be right about the future, a fallacy that most investors don't understand. But it helps be disciplined about the present.

A good example would be the small-cap rally in 2023. The Nifty Small Cap 250 index rallied over 47 per cent that year, followed by 26 per cent in 2024. Retail investors piled in, and many portfolios shifted from their original allocation if they didn't rebalance. Those without systematic rebalancing were now sitting on unintended concentrated small-cap bets, exposed to the extreme swings in volatility in the asset class.

A thermostat approach would have trimmed small caps as they exceeded a predefined limit, booking profits, and reallocating those to underweight sections of the portfolio. This would have helped contain concentration risk in the portfolio and hence helped them save capital when small caps eventually underperformed, as they did in 2025.

The psychology behind the thermostat solution

The thermostat isn't just about better returns, though the evidence is there that you get them. It's about peace of mind. It's about going to bed without checking your portfolio at midnight. It's about staying invested through

Rebalancing creates accountability as it becomes hard to deviate from your own predetermined rules

Illustration: ANAND

volatility because you trust your system more than your emotions.

Rebalancing removes decision fatigue. The rules are already set in advance. It eliminates timing anxiety, as you need to be correct twice when timing the market—when to sell and then when to buy, or vice versa. Rebalancing creates accountability as it becomes hard to deviate from your own predetermined rules. It helps shift your focus from daily noise to long-term happiness. It helps shade your portfolio from emotional biases. The thermostat doesn't fight these biases; it just makes them irrelevant in the long run.

Do you have a thermometer or a thermostat?

If you checked your portfolio yesterday and today, felt a flutter of anxiety at the numbers you saw, and wondered if you should do something, then you definitely have a thermometer.

On the other hand, if you have target allocations, rebalancing bands and rules you follow regardless of market fluctuations, you have a thermostat.

If you fall into the former, the good news is that you can set up your thermostat this weekend itself. It's a DIY approach—define your allocation, set your bands and commit to quarterly reviews to adjust it. Once you do, you'll wonder why you spent so much time obsessing over your portfolio's temperature. Because in the end, investing isn't about reading the temperature perfectly. It's about setting the thermostat wisely and then let math do what it was designed to do. ☑

SHYAMALI BASU

The hardest part of investing

Why patience matters more than predictions

Patience and perseverance are virtues behind most meaningful achievements in life. Lately, watching the mood around investors, I'm reminded of a Sanskrit shloka:

“शनैः पन्थाः शनैः कन्था शनैः पर्वतलङ्घनम्।
शनैर्विद्या शनैर्वित्तं पञ्चैतानि शनैः शनैः॥”

It speaks of progress that comes slowly, step by step, whether it is walking a path, weaving a fabric, climbing a mountain, gaining knowledge or creating wealth. None

of these can be rushed without cost.

Yet, every morning we wake up to a fresh headline that claims to change everything. The rest of the day is spent reacting to it. The noise is relentless, and staying unmoved by it has become harder than ever.

When markets test patience, not conviction

Over the past year, markets have gone nowhere on the surface, but beneath the index, many stocks have corrected far more than benchmarks. At the same time, precious metals have delivered one of their strongest rallies in decades.

Narratives have shifted quickly. Artificial intelligence (AI) dominated equity conversations. I heard many investors express regret that India did not offer a direct way to participate in the theme. Expectations from equities, once stretched, are now being reset to more reasonable levels than before.

What stood out during this phase was not clever stock selection, but asset allocation. Portfolios with exposure across multiple asset classes behaved better and felt easier to live with. While the FIIs, FDIs, and a few promoters cashed out, retail investors, through steady SIP flows, have continued to provide stability.

This phase has also reminded us of a basic truth. Equity returns cannot be extrapolated

Illustration: ANAND

endlessly. Markets go through cycles of price movement and time correction. If India's fundamentals remain strong and policy continuity holds, opportunities will emerge again, often when attention is elsewhere.

Look beyond the noise, stay anchored to life

In the mental circus that investors often find themselves in, it helps to shift perspective. Businesses continue to run. Salaried employees largely go about their work as before, unless their sector faces disruption. Life events do not pause just because markets are volatile.

That is how countries progress, too, brick by brick, slowly but steadily. India has often moved forward when tested, and this phase is no different. Efforts are being made across sectors, sometimes quietly, without

If India's fundamentals remain strong and policy continuity holds, opportunities will emerge again, often when attention is elsewhere

dramatic headlines.

Wealth creation works the same way. It demands time, discipline and the ability to ignore narratives that are not aligned with your own goals. People who amplify market noise rarely know your financial needs, responsibilities or time horizon.

Even at the risk of sounding repetitive, the reminder is worth making. Successful investing is less about reacting to every new development and more about staying invested in a plan that fits your life. Patience is not passive. It is an active decision to stay the course when distractions are loudest. ☒

[THE PLAN]

Prepay the home loan or keep investing?

Why this decision is more emotional than it looks on paper

By Siddhant Madhav Joshi

At 38, Rohan is making the biggest financial commitment of his life. He is buying a home in Bengaluru worth ₹2.20 crore and has taken a home loan of ₹1.76 crore. The EMI fits within his income, but the sheer size of the loan has made him pause and rethink how he should manage his savings going forward.

Until now, Rohan invested ₹1.5 lakh a month through SIPs for long-term goals. With the home loan in place, he plans to cut this to ₹50,000 a month. He also expects annual bonuses and lumpsums of around ₹5 lakh a year.

What troubles him is not affordability, but direction. Should he aggressively prepay the loan and become debt-free early? Should he continue investing and let the loan run its course? Or is there a middle path?

Why this decision feels harder than it should

The home loan versus investing debate has always

Equity vs home loan rates

For a loan taken in 2006, equities lagged home loan rates for nearly a quarter of the time

Portfolio returns are calculated on an XIRR basis, assuming SIP investments from January 1, 2006, with a lumpsum invested every 12th SIP. Home loan rates reflect the maximum floating rate applicable each month. Actual monthly data is used up to May 2019; for the remainder of 2019, the average of January-May 2019 rates is applied. From 2020 onwards, rates are conservatively modelled using publicly available ranges, with linear increases assumed within each period; hence, rates may vary.

Worst months for all-equity

Periods when equity investors saw the deepest interim losses

existed. What has changed is how intensely it is now analysed.

On one side is modern optimisation thinking, which compares home loan interest rates with long-term equity returns and suggests investing instead of prepaying. On the other is traditional wisdom that prioritises eliminating debt as early as possible, often without considering opportunity costs.

Both views make sense in isolation.

The problem begins when long-term financial decisions are reduced to neat comparisons that assume stable incomes, smooth markets and perfect investor behaviour.

Personal finance does not play out on spreadsheets alone. It unfolds over decades, across market cycles, job changes and emotional stress. That is where nuance matters.

Why balance beats extremes

Investing while prepaying the loan delivers better outcomes over time

100% annual surplus: ● toward loan pay-off ● in diversified equity
● 50% annual surplus toward pay-off and rest to investing

Assuming home value grows at 6 per cent per annum (inflation rate) and equity investments are based on an average regular flexi-cap fund since January 2006. Net worth includes home value and mutual fund investments, less outstanding home loans. In cases where savings are used to pay off a loan, the loan is paid off early, for the remaining years, SIP in equity funds is considered.

Why recent returns can mislead

Strong equity returns over the past few years have added another distortion. Many investors have experienced markets largely in an upward phase, reinforcing the belief that equity reliably beats loan costs over time.

Over long periods, equity has indeed delivered superior returns. Over the past two decades, an average flexi-cap fund has generated annualised returns of around 13-14 per cent in the long-term, comfortably higher than a typical home loan interest rate of 7-9 per cent.

But averages hide uncomfortable realities.

There have been extended phases when equity returns lagged home loan interest rates. Check the graph 'Equity vs home loan rates.' More importantly, equity portfolios experience sharp interim declines even as loan obligations remain unchanged. Check the graph 'Worst months for all-equity.'

During periods of market stress, such as 2008 or early 2020, falling portfolio values combined with a large outstanding loan can strain both finances and behaviour. Optimisation looks easy in hindsight. Living through volatility is harder.

The right way to think about a home loan

A home loan is fundamentally different from other debt. It is long-term, relatively low-cost and backed by a tangible asset that provides utility and long-term value.

Because of this, the rule of eliminating all debt before investing does not apply neatly to home loans. At the same time, treating a home loan as irrelevant because equity returns have been strong assumes a level of emotional resilience and income certainty that few investors consistently possess.

Aggressive prepayment saves interest but often comes at the cost of liquidity. An all-equity approach maximises long-term potential but exposes investors to deeper drawdowns and behavioural risk during market stress.

A balanced approach offers a more stable experience. Portfolios that combined continued equity investing with gradual loan prepayment experienced meaningfully lower drawdowns during market corrections than portfolios that were heavily skewed to equity. That stability often matters more than maximising returns on paper.

What Rohan should focus on instead

Before worrying about optimisation, Rohan needs to secure the foundation.

An emergency corpus covering at least six months of household expenses and EMIs is essential. Adequate term insurance and comprehensive health insurance ensure the home does not become a vulnerability during unforeseen events.

His reduced SIP of ₹50,000 a month should remain focused on long-term goals and invested primarily in equity mutual funds. These investments should not be treated as a source for routine loan prepayments.

Annual bonuses offer flexibility. Deploying a portion of this surplus towards loan prepayment, 50-60 per cent, while investing the rest allows the loan to reduce steadily without disrupting wealth creation. This balance helps investors remain calm during volatile market phases.

The objective is not to eliminate the loan at the earliest, but to reach a point where repaying it becomes optional.

The bottom line

Loans should be used thoughtfully, not feared or endlessly optimised. Markets behave differently from expectations, incomes are not perfectly predictable and emotions play a far bigger role than most investors acknowledge.

A home loan represents a long-term commitment to a deeply personal goal. Excessive aggression, whether towards prepayment or investing, can increase stress and, in extreme cases, put that goal at risk.

By avoiding extremes, investing steadily and prepaying regularly, Rohan can protect his home, build long-term wealth and retain the flexibility to adapt as reality unfolds rather than as theory suggests. ☑

Value Research

For expert advice

Valuation of mutual funds

Can mutual funds also become overvalued like individual stocks? If yes, should one start SIPs in such markets?

– Shivani Dharmesh Shah

Equity mutual funds mirror the valuations of the stocks they hold. As a result, during expensive market phases, their portfolios can appear stretched on metrics such as the price-to-earnings (P/E) ratio.

That said, valuation measures are far less meaningful for mutual funds than for individual stocks. Unlike stocks, which can correct sharply when valuations unwind, mutual funds tend to be more stable thanks to diversification. Further, in active funds, managers can also shift portfolio positioning and valuation exposure to cushion the impact of market corrections.

Over the long term, our analysis shows a negligible difference in outcomes between investors who attempt to time entry points and those who stay invested through overvalued phases.

For this reason, SIPs remain a sensible approach even in expensive markets. While they do not guarantee higher returns, they help manage timing risk through rupee cost averaging and reduce the impact of sharp valuation-led declines.

Lumpsum investment in small-cap funds

Is a lumpsum investment in small-cap funds advisable?

– Janardhan Nair

We have long advocated for SIPs over lumpsum investments, as they spread the money over time and reduce the risk of entering the market at an unfavourable peak.

This risk is especially high in small-cap funds, where lower liquidity leads to sharper stock price swings.

A lumpsum investment can therefore

If you are holding surplus cash, it is more prudent to deploy it through SIPs or systematic transfers over 12 to 18 months

Gold can act as a stabiliser during equity downturns, but it is not a growth asset, so its allocation should remain modest

expose investors to steep short-term losses if markets correct soon after entry.

Staggered investments also reduce the risk of poor timing. If you are holding surplus cash, it is more prudent to deploy it through SIPs or systematic transfers over 12 to 18 months.

While this may not enhance returns, it can make the investment journey significantly smoother and stress-free.

Diversifying a large sum

Once a portfolio crosses ₹1 crore, should investors diversify across multiple funds within the same category, add international funds or include gold funds?

– Arjan Kumar Bhatia

Crossing ₹1 crore does not automatically mean you need more funds. The real issue is concentration risk.

If a large portion of your portfolio depends on a single fund manager or investment style, adding another fund can help, provided portfolio overlap is low. Otherwise, it merely adds complexity without meaningful diversification.

A more effective step, especially for larger portfolios, is diversification across asset classes. International equity can reduce India-specific risk and provide exposure across geographies and currencies, but it is suited to long-term goals and should be allocated in a measured manner.

While gold can act as a stabiliser during equity downturns, it is not a growth asset and therefore, its allocation in your portfolio should remain modest.

For most investors, the priority should be clear: ensure core equity is spread across a few well-chosen funds, add international exposure for long-term diversification and use gold sparingly as a shock absorber.

Avoid holding too many funds within the same category.

Process of gifting mutual funds

What has changed in the process of gifting mutual funds, and how does it work for units held in SoA accounts?

Gifting mutual funds has always been legally permitted, but the process was cumbersome. Most investors hold units in Statement of Account (SoA) form and earlier had to dematerialise these holdings before they could be gifted, a step many were unfamiliar with.

SEBI has now enabled direct gifting of units held in SoA form. Since registrars already maintain ownership records, investors can simply authorise the registrar to transfer the units to another person. The records are updated without any need for dematerialisation.

It is an operational change, not a legal one, but a meaningful improvement. It removes an unnecessary hurdle and aligns the process with how investors typically hold mutual funds. Normal tax rules apply when the units are eventually redeemed.

Understanding investment risk

How should investors think about risk instead of being fearful?

Risk has multiple dimensions. First is suitability risk; even the best product is useless if it does not fit your goals. A liquid fund won't deliver growth, while an equity fund won't provide short-term stability. Risk can't be understood intellectually alone; you need to experience it. People can't predict how they'll react to a 30 per cent fall until their money actually drops. Money urgency is critical. Long-term confidence is

Watch video

Unlike gold, silver has strong industrial utility, as renewables and new technologies create genuine consumption demand

Watch video

irrelevant if you need funds in three years. Advisors help match products to your needs, timeline and temperament.

The second risk is behavioural, and hard to predict. We don't know how new SIP investors will react to 15 per cent drops. SIP investing cushions panic.

Finally, markets sometimes go sideways. For patient SIP investors, time corrections allow buying at reasonable prices without the shock of sharp falls.

Silver's blockbuster surge

Investors are treating silver like the new Bitcoin. What is really happening?

Silver's surge is more fundamental than hype suggests. Unlike gold, silver has strong industrial utility, as renewables and new technologies create genuine consumption demand beyond sentiment. Gold remains almost entirely a precious metal, while silver is largely industrial.

India's financialisation of silver through ETFs has added new, steady layers of demand by reducing friction and improving access.

Also, gold is mined directly, but silver is mostly a by-product of mining metals such as zinc. Supply is incidental. You can't simply mine more silver when prices rise, since that would require increasing zinc production for entirely different economic reasons.

When rising industrial demand and financialised investor demand meet a constrained, slow-responding supply, prices move sharply and narratives take over. Treating silver as 'the next Bitcoin' misses these fundamentals. The real story is demand converging with a supply that cannot be switched on quickly.

[SCOREBOARD] Guide

Optimise your investments with clear and comprehensive mutual fund data

► Serial Number

A serial number is generated for every fund and is the first column on the Scoreboard. To locate a specific fund, look for this number in the Index against the name of the fund.

► Portfolio Composition

For equity funds, it shows the portfolio's allocation in large-, mid-, small-cap stocks and cash/others. **Value Research** follows its own market-cap classification to arrive at this. The top listed companies that constitute 70 per cent of the market cap are classified as 'large caps'. The ones that fall between 70-90 per cent of the total market cap are classified as 'mid caps'. The smallest listed companies that comprise the remaining 10 per cent of the market cap are called 'small caps'.

In the case of hybrid funds, the minimum and maximum allocations to equity and debt over the past 12 months are displayed. For funds launched within the last year, the available historical range is provided. The equity exposure is shown net of derivatives (unhedged portion).

Portfolio Composition (%)			
Equity		Debt	
Min	Max	Min	Max

► Alpha

Indicates value added (or subtracted) by the fund vis-a-vis the benchmark, for the risk taken. A positive alpha indicates that the fund has performed better than expected, while a negative alpha indicates the fund has underperformed based on the risk taken by the fund manager. It is calculated using calendar month returns for the last three years.

Performance										Portfolio Composition (%)																									
Returns (%)										Rank				Large Cap		Mid Cap		Small Cap		Cash & Others		Alpha		Info. Ratio		Risk Grade		Expense Ratio (%)		Assets (₹ cr)		Fund Rating		Average Rating	
S.No.	Fund Name		1Y	3Y	5Y	10Y	1Y	3Y	5Y	10Y	Cap	Cap	Cap	Others	Alpha	Ratio	Grade	Ratio (%)																	

Portfolio Composition			
Credit Quality (%)		Avg. Maturity (years)	
High	Medium	Low	

► Credit Quality

Debt fund's portfolio exposure across three levels:

- **High**
Includes exposure to government securities and corporate bonds with the highest grade ratings such as AAA, AAA+, AAA-, A1, A1+, P1+, AA+ and cash.

- **Medium**
Includes exposure to bonds with medium grade ratings such as AA, AA-, A2+ and A2.

- **Low**
Includes portfolio exposure to bonds with lowest grade ratings such as A+, A, A-, A3, BBB+, BBB, BBB-, BB+ and below.

► Average Maturity

Weighted average maturity of all debt securities held by the fund.

► Information ratio

Indicates excess returns generated by a fund relative to the category benchmark and the consistency of that out-performance. A higher information ratio compared to other schemes with the same benchmark reflects better risk-adjusted performance. It is calculated using calendar month returns for the past three years.

► Risk Grade

Value Research Fund Risk Grade measures a fund's risk of loss, focusing only on downside volatility, unlike standard deviation and beta. It accounts for absolute losses and periods of underperformance compared to a risk-free investment. This reflects the risk of earning less than a guaranteed return, such as from a term deposit. Fund risk is calculated by comparing monthly/weekly returns to the risk-free return (State Bank's 45-180 days Term Deposit Rate) and measuring underperformance. Average underperformance is used to derive a risk score, which is rated against the category average. The risk score of a fund is then rated according to the following distribution:

High : Top 10%
Above Avg (+Avg) : Next 22.5%
Average : Middle 35%
Below Avg (-Avg) : Next 22.5%
Low : Bottom 10%

► Fund Rating

The **Value Research Fund Rating** is a convenient composite measure of returns and risk, based on a quantitative system without any subjective components. It provides a quick summary of a fund's historical performance relative to its peers, adjusted for risk. For equity and hybrid funds, the system combines three- and five-year performance periods, while debt funds' ratings are based on 18 months and 36 months of weekly risk-adjusted performance. Only equity funds with a minimum three-year performance history are rated, and for debt funds, the minimum is 18 months. A category must have at least 10 funds with an average AUM of at least ₹5 crore over the past six months to be rated. The rating distribution is as follows:

★★★★★ : Top 10% funds
 ★★★★★ : Next 22.5%
 ★★★ : Middle 35%
 ★★ : Next 22.5%
 ★ : Bottom 10%
 NR : Not Rated

► Average Rating

The average of the monthly fund ratings over the past three years. For newer funds, the available rating history is used.

[END NOTE]

Built to fall less

Market-cap indices lean toward stocks that fall less

Most stocks fall hard. Indices don't, equally

The probability of large drawdowns rises sharply beyond large caps

In % of stocks

Drawdown from peak	Nifty 50	Nifty 100	Nifty Midcap 150	Nifty Smallcap 250	Nifty 500
Less than 5%	18	14	7	4	7
More than 5%	82	86	93	96	93
More than 10%	54	70	87	92	86
More than 25%	18	35	58	74	61
More than 50%	4	8	16	28	20
Index return from peak (%)	-0.39	-1.58	-1.34	-10.58	-2.34

Data as of February 6, 2026.

Index construction shapes downside

Market-cap indices tilt toward resilience

*Equal-weighted

Data as of December 31, 2025.

When markets fall, structure matters

Larger exposure to smaller stocks magnifies falls

**All time high, *Equal-weighted

Total Return Index (TRI) considered.

Nippon India Mutual Fund

Wealth sets you free

GOLD ETFs

BACKED BY

REAL GOLD

A framework built on trust

SECURE

Backed by physical
Gold stored by
SEBI-registered
custodians

PURE

Has a purity
of 99.5%
as per regulatory
standards

REGULATED

By Securities and
Exchange
Board of India
(SEBI)

Want an investment that's truly worth its weight in Gold?

Gold ETFs offer units backed by real Gold that's 99.5% pure, securely stored, and supported by a structure that operates under SEBI's regulatory framework. Plus, with the iNAV serving as a good measure of an ETF's fundamental value, it's best to place your order closer to it. That way, you can invest with confidence; having no concerns of purity and a hassle-free investment experience to back it.

Key highlights

Tax filing and compliance

- Return revision window extended till March 31
- Small taxpayers allowed to update returns even after reassessment (with additional tax)
- Certain procedural tax offences decriminalised; minor offences shifted to a fine-only regime
- Faster dispute resolution through a pay-and-close mechanism
- Form 15G / 15H can be submitted centrally via depositories

Overseas remittances and spending

- Tax collected at source (TCS) on overseas tour packages cut to 2 per cent
- TCS on education and medical remittances under LRS cut to 2 per cent (from 5 per cent)
- One-time six-month foreign asset disclosure window for small taxpayers
- Retrospective immunity for small foreign asset non-disclosure up to the aggregate value of ₹20 lakh

Capital markets and trading

- Higher cost for derivatives trading
- Securities transaction tax (STT) increased on futures to 0.05 per cent from 0.02 per cent
- STT increased on options premiums and exercise of options to 0.15 per cent from 0.1 per cent and 0.125 per cent, respectively
- Clear signal against excessive speculation

Gold and alternative assets

- Sovereign gold bonds (SGBs) are tax-free at maturity only if bought at the original RBI issue

- SGBs purchased from the secondary market are now taxable at redemption

Buybacks and shareholder taxation

- Buyback proceeds are to be taxed as capital gains in shareholders' hands instead of at the company level
- Promoters to bear additional buyback tax, effectively bearing 22 per cent and 30 per cent tax for domestic and non-domestic promoters, respectively
- Discourages tax arbitrage motivated buybacks by promoters, encouraging better corporate governance for investors

New market avenues

- Market-making framework for corporate bonds
- Total return swaps to be introduced for bond markets, increasing liquidity in capital markets
- Incentives for large municipal bond issuances
- CPSE real estate to be monetised via dedicated REITs

Capex beneficiaries

- Continued high public capital expenditure to a record ₹12.2 lakh crore
- Strong support for MSMEs via the SME growth fund and higher liquidity measures by banking channels
- Key sectors targeted include biopharma, semiconductors, electronics, rare earths, textiles, and clean energy technologies
- Focus on defence, electronics, semiconductors and clean energy
- Tax incentives for data centres and cloud infrastructure

Tightening the screws

Higher STT and new buyback taxes to curb excess

Budget 2026 does not alter the fundamentals of long-term investing. Instead, it redraws the boundary of what the government is willing to tolerate in markets.

The clearest signal comes from derivatives trading. Securities transaction tax (STT) on futures has been increased from 0.02 per cent to 0.05 per cent. On options, STT is now 0.15 per cent on both premium and exercise. For high-turnover strategies, the impact is meaningful. With retail F&O participation already surging, the budget raises friction where it had become unusually low. The message is simple: very short-term trading will no longer be subsidised through minimal costs.

An equally important shift concerns share buybacks. Buyback proceeds will now be taxed as capital gains in the hands of shareholders, replacing company-level taxation. Promoters face an additional buyback tax, taking their effective rate to 22 per cent for domestic promoters and 30 per cent for non-domestic promoters. Companies will need clearer capital-allocation logic to justify buybacks rather than relying on promoter-level tax efficiency. For minority shareholders, buybacks funded by genuine surplus capital remain viable; those driven primarily by tax efficiency do not.

Taken together, these changes do not target long-term investors. Their impact is concentrated on frequent trading and promoter-specific incentives, indirectly reinforcing market discipline by adding friction where excess had built up.

Investing beyond equities

Beyond equities, the budget continues

Nitin Yadav/AI-generated images

the effort to deepen other parts of the investment ecosystem. The focus is on market structure, liquidity and clarity, not on launching new products.

A key proposal aims to strengthen the corporate bond market through a market-making framework and the introduction of total return swaps to improve liquidity and price discovery.

Municipal finance receives a push too. An incentive of ₹100 crore is proposed for a single municipal bond issue exceeding ₹1,000 crore, signalling a move toward larger, market-linked funding for urban infrastructure.

Asset monetisation expands through dedicated REITs for real estate held by central public sector enterprises, creating more listed income-generating property while unlocking capital for public entities.

Finally, a clarification on sovereign gold bonds (SGBs): the capital gains exemption at maturity will apply only to SGBs subscribed at original issuance and held to maturity by individual investors. Secondary-market buyers will no longer receive this exemption.

Cross-border tax relief

Budget 2026 cuts TCS and eases foreign compliance

Some of the most practical changes in Budget 2026 are not in the headlines, but in the fine print aimed at Indians whose financial lives span borders. Whether you remit money for education or healthcare, travel frequently, hold overseas assets or manage family finances across countries, this year's proposals bring meaningful relief. The common theme is simplicity: lower friction, fewer surprises and reduced compliance anxiety.

Lower tax hit on education and medical remittances

Remittances under the Liberalised Remittance Scheme (LRS) for overseas tuition or medical treatment will now attract a reduced tax collected at source of 2 per cent, down from 5 per cent. For families already managing high costs, this eases cash-flow pressure.

Overseas travel without upfront tax blockage

TCS on foreign tour packages has also been cut to 2 per cent with no minimum threshold, removing the earlier 5-20 per cent blockage that complicated budgeting for frequent travellers and NRIs.

A softer approach to foreign asset disclosure

Foreign asset reporting has long caused anxiety, with even small omissions carrying severe consequences. The budget introduces a one-time, six-month disclosure window and offers retrospective immunity from prosecution for non-disclosure of non-immovable foreign assets below ₹20 lakh. This recognises the fact that complexity is often the cause of non-compliance.

Smoother taxation for cross-border income

To reduce uncertainty for non-residents, the budget proposes automated systems for lower or nil tax deduction certificates and simpler dispute resolution. It also removes minimum alternate tax (MAT) for non-residents taxed on a presumptive basis, eliminating a common source of unexpected liability.

Easier access to Indian equities for overseas investors

The budget also expands investment access. Persons resident outside India are now permitted to invest directly in listed Indian equities through the Portfolio Investment Scheme, within prescribed limits. This provides a clearer, more direct route for overseas Indians to maintain or build equity exposure to India.

Together, these changes meaningfully reduce friction. For Indians managing money, taxes and investments across borders, Budget 2026 makes the system a little less intimidating and a lot more workable.

No tax cuts, just ease

Longer deadlines and fewer procedural tax risks

Budget 2026 does not bring any change to the income-tax slabs, rates, or exemptions for individuals. However, it does offer a shift in emphasis. The focus is on making compliance easier, timelines clearer and the system less intimidating. The message is consistent: stability and predictability matter more than headline cuts.

What changes for taxpayers

While tax rates remain unchanged, the budget introduces several improvements in filing and compliance.

The deadline for revising income-tax returns has been extended to March 31, giving taxpayers more time to correct genuine errors. Updated returns can now be filed even after reassessment proceedings have begun, subject to payment of additional tax.

Several procedural irritants have been eased. Non-production of books of account or documents, and failure to

deduct tax at source on payments made in kind, have been decriminalised. This reduces the risk of harsh consequences for procedural lapses rather than deliberate evasion.

The process for obtaining lower or nil tax deduction certificates will move to an automated, rule-based system, which should make compliance easier, particularly for small taxpayers and those with fluctuating incomes.

Investors holding securities across multiple companies will also benefit from the ability to submit Form 15G or Form 15H centrally through depositories.

The budget also aims to speed up dispute resolution. Assessment and penalty proceedings will now be combined into a single order, and immunity provisions have been expanded where additional tax is paid.

Together, these steps reduce friction, uncertainty and prolonged litigation.

Personal income tax structure remains unchanged

Tax slabs under the old and new tax regimes for FY2026-27

Old regime		New regime	
Income (₹)	Tax rate(%)	Income (₹)	Tax rate (%)
Upto 2.5 lakh*	Nil	Upto 4 lakh	Nil
2.5 to 5 lakh	5	4 to 8 lakh	5
5 to 10 lakh	20	8 to 12 lakh	10
Above 10 lakh	30	12 to 16 lakh	15
		16 to 20 lakh	20
		20 to 24 lakh	25
		Above 24 lakh	30

*Upto ₹3 lakh if you are a senior citizen and ₹5 lakh if you are more than 80 years old.
An additional health and education cess of 4 per cent is applicable on the tax payable.
