Ponmythili Muralidharan

May is here and the Board exam results are out. Your phone is buzzing with calls from relatives and your parents are fielding calls from people you barely remember. Everyone wants to know how you did. Before you answer that, can we pause for a moment? Not to avoid the question, but to ask a better one: what is a result, really?

Think of it like a milestone on a highway. It tells you where you are right now, not where you are going; definitely not who you are. When you see a board that says 500 km to Chennai, it is just a marker. It does not tell you if Chennai is even where you want to go. What matters is what you do when you reach it.

Clues to yourself

If you did well in the exam, enjoy it. But do not stop there. Did you find your own way of understanding things? Did you stay consistent when it got tiring? Was there a subject you genuinely enjoyed? These are clues, not just about exams, but about you.

Each of us has what I like to call a power zone. It is that space where the way your mind naturally works meets something the world actually needs. Some people make complicated things simple without trying. Some carry 10 moving parts in their head without dropping any. Some are the person everyone calls when a conflict needs sort-

GETTY IMAGES/ISTOCKPHOTO

Beyond the marksheet

As board exam results season begins, an educator reflects on what marks mean and how to deal with success and failure

ing. These are not soft skills. These are the engines that run careers and lives.

However, if you did not do well, stay with me. An exam you did not clear is not a wall. It is a question: what happened here? Not “am I a failure?” Because that is a story you are telling yourself. Instead, ask

“What did this exam expect from me? Where did I fall short?” Was it time-management? A gap in understanding? Anxiety taking over? Each has a different answer.

Own the win and the miss
Panic will not help you find it, but an honest question

will. Own both the win and the miss. If you did well, do not brush it aside saying you were lucky. A win you do not accept does not teach you anything. If you did not do well, own that too. Not to be hard on yourself but to stay in control of what comes next. The moment you start blaming the paper or the

situation, you give away your ability to change things. The gap it shows will stay until you are willing to look at it.

If success goes to your head, it makes you careless. If failure goes to your heart, it makes you shrink. What you need is for both to reach your mind. However, be careful of quick fixes.

After the results are declared, there will be a lot of advice: do a course. Take a certification. Try something else. Some of this may genuinely help. But, sometimes, it is just a way to avoid a difficult question. If you move on without understanding why you struggled, the same pattern will repeat itself. The real question is not just “what next?” but “what am I building towards?”

Here is something we do not talk about enough. Many people go through life without asking what they are good at. It is easier to compare marks, colleges, placements. But that is someone else’s measure, not yours. What comes naturally to you? What do you enjoy? What makes you lose track of time? If you do not know yet, it is okay. Look at where the world is heading, then look at what you are drawn to. Where those two meet is a good place to begin. You do not need perfect clarity. You just need direction.

A word to parents. Your child’s result is not your report card. When we make it about our own image, we add to the pressure they are already carrying. What they need is someone who can stay calm and say “this is one moment. I see you beyond this.”

You know your score. Ask yourself what it is telling you and what it is not. The people who go on to do meaningful things are not always the ones with the highest marks. They are the ones who learned to understand themselves and keep moving forward, through both success and failure.

That confidence does not come from marks. It builds when you choose honesty over excuses and curiosity over comparison. May is a good month to begin.

SCHOLARSHIPS

Sports Global Excellence Scholarship

Offered by the University of Gloucestershire, the U.K.
Eligibility: Open to international self-funded fee-paying students, who can cover 100% of their tuition fees and are enrolled in a full-time UG or PG taught degree programme and can demonstrate performance at the required level in their respective sports categories.
Rewards: Waiver of up to £7,500
Application: Online
Deadline: May 31
www.b4s.in/edge/SGSE2

King’s College London Vice-Chancellor’s Awards

Offered by the King’s College London, the U.K.
Eligibility: Open to domiciled Indian students

pursuing full-time, on-campus postgraduate taught degree under one of the specified faculties.
Rewards: £5,000 reduction in fees
Application: Online
Deadline: May 31
www.b4s.in/edge/KCLV1

Nottingham Trent University International Scholarships

Offered by the Nottingham Trent University, the U.K.
Eligibility: Open to international students seeking enrolment in the first year of an eligible UG or PG programme or pursuing second/ third year of a UG course in the case of advanced entry in September 2026.
Rewards: Fee waivers
Application: Online
Deadline: June 24
www.b4s.in/edge/NTUI2

Courtesy: Buddy4study.com

vivo Ignite

vivo India has launched the fourth edition of vivo Ignite: Technology and Innovation Initiative. The programme has seven phases culminating in a national final to be held on October 11 in New Delhi.

Eligibility: Students from Class 8-12 can participate individually or groups of three.
Deadline: June 30
vivoignite.com/

Intern With Icon

Internshala has launched Intern With Icon, in which interns will work with six entrepreneurs across business, marketing, operations, strategy, content, and growth.

Dates: May 27 to July 31
Eligibility: Students or recent graduates from any stream
Deadline: May 10

You need a strategy

Uncertain about your career options? Low on self-confidence? This column may help

OFF THE EDGE
Nandini Raman

I am a first-year B.A. LLB student. I'm not sure if I should prepare for litigation or judiciary. Which is better? How should I prepare and when should I start? Karan

Dear Karan,

There's no universal 'better'; only what is 'better for you'. With litigation, you become an advocate, stand in court, argue cases, draft petitions, and file documents. You will start by working under a senior advocate and learn the trade through apprenticeship. The financial struggle is real in the initial years. But, after building credibility and a network, income does scale significantly.

The judiciary is a stable path to becoming a judge. You sit on the bench, hear arguments, and deliver judgments. You enter through the state-level Judicial Services Examinations (PCS-J) after your LLB. This brings prestige, power and a stable income. The exam is fierce and the success rate is low. The Supreme Court has mandated three years of legal practice as the eligibility requirement for Civil Judge (Junior Division) in most states.

Ask yourself what you will enjoy more. If you enjoy the adrenaline of argument, then litigation may work for you. If you don't, it can be exhausting. Lawyers persuade. Judges decide. Which role suits your personality? How important is 'work-life balance' to you?

You do not need to choose immediately. Build a foundation that keeps both

doors open. Master the core subjects, and follow court proceedings. Sit in the gallery of your local district or High Court and watch lawyers argue and judges react. You will know your calling in time.

I am doing Economics Honours (first year). I am wondering whether to finish the honours course or stop with the third year and do a PG in Economics or Developmental Studies. Or should I take the UPSC, IES or RBI Grade B exams? Ishani

Dear Ishani,

You have the time to explore, decide, and prepare without pressure. You can complete your honours course and enter the job market or start exam preparation. But an undergrad is increasingly becoming insufficient for specialised roles. If you are serious about IES, RBI DEPR, or a research-oriented career, you must do a PG. However, you can sit for UPSC exams with a Bachelor's degree.

An M.A. or M.Sc. Economics or Development Studies will take two years but will open doors to NGOs, research organisations, and international agencies.

You don't need to choose today. But you need a strategy. Introspect on what you enjoy. Is it the policy depth of IES, the monetary power of the RBI, the district collector romance of UPSC or the grassroots connection of development work?

Master the foundations of your subject. Read up on the Economic Survey, the Budget, and track RBI policies, and inflation and trade trends. Maintain a

strong CGPA and gain practical exposure through internships. Then you can decide.

I am in Class 11 Science stream. Though interested in space-related courses, I do not want to study Physics. Does astrophotography have scope? Where can I study this subject? Name withheld

Astrophotography is at the intersection of art and science. The core skills are patience and persistence (nights outdoors, troubleshooting equipment, and sometimes having no usable images), technical photography (understanding aperture, shutter speed, ISO, and composition), and post-processing software (using tools like Deep Sky Stacker or PixInsight).

There are no formal degrees in astrophotography yet but specialised courses and workshops teach the skills. Options include a three-month observational astronomy course by Horizon Astronomical Society and a two-month sky photo trip by Aperture Telescopes. For careers, programmes by SPACE India require a UG or PG in Physics or Astronomy.

Astrophotography has limited job postings but you can work as an astronomy educator, a freelance astrophotographer, or a workshop host. You can also contribute to research through data capture. Related careers include meteorology, geology, and science communication.

Start now with a smartphone's 'Pro Mode' and capture the night sky. Join a community, a local

amateur astronomy club and take foundation courses that will give you hands-on experience.

I finished Mechanical Engineering in 2021 and am working as a PLM Analyst in an MNC. I want to move into leadership roles, but am uncertain about how to achieve this. I have completed courses in Business Analytics, Power BI, and related analytical tools. Apart from reading, I am also interested in research and exploration. Sai

Dear Sai,

Get behind the 'why' of 'what' you are doing right now. Instead of just delivering a Power BI dashboard, ask 'How will this dashboard reduce our time-to-market by 10%?' Research your company's quarterly goals. Map your PLM tasks to high-level objectives. When you speak to management, use their leadership language.

Leverage your research mindset by documenting a complex PLM problem you've solved and presenting insights as a white paper or team session. Explore how AI is reshaping PLM and propose pilot ideas. Network across teams, join cross-functional projects, and seek a senior mentor to tackle high-impact, unsolved challenges.

Work on Specialised Certifications such as Lean Six Sigma (Green/Black Belt), PMP, Prince2, SAFe (Scaled Agile Framework).

Tristha Ramamurthy

Many students begin college with great hope but, as the years pass, the clear sense of direction they expected is often replaced by confusion. They look forward to practical, hands-on learning but find that much of their coursework is theoretical. The confidence they had about securing a job after graduation is also challenged by the tough competition in the job market. This gap between expectation and experience is one of the most under-discussed challenges in Indian higher education.

Millions of first-generation learners and aspirational families are investing heavily, both financially and emotionally, in college education. Students enter with clear expectations: that their college will help them discover a meaningful career path, that their degree will translate into employability, that their campus will connect them with industry and opportunity... These expectations are shaped by institutional messaging, peer narratives, and the larger promise of India's demographic dividend. However, employability surveys over the years have consistently suggested qualification does not automatically translate into job readiness. The issue is not one of capability, but of alignment.

Institutional issues

It would be convenient to attribute this entirely to market volatility. That would be intellectually insufficient. Colleges and universities must confront a structural reality: many programmes remain exam-driven rather than outcome-driven. Despite the widespread adoption of Outcome-Based Education frameworks, implementation is uneven. Curricula may articulate outcomes, but assessments do not always measure applied competence. Students may accumulate credits without

GETTY IMAGES/ISTOCKPHOTO

Expectation vs. reality
Why higher education needs to bridge the gap between what students anticipate and what they experience in college

necessarily engaging in sustained real-world problem-solving. Mentorship often depends on the initiative of individual faculty members rather than institutional design.

While the National Education Policy (NEP) 2020 offers a blueprint for reform through multidisciplinary exposure, flexible academic pathways, vocational integration and experiential learning, translating policy intent into classroom practice requires institutional courage and cultural change. Career guidance remains a particularly weak link. Many students navigate crucial academic and professional decisions with minimal structured mentoring. By the time uncertainty becomes visible in the final year, options can feel limited. Industry engagement, too, often remains episodic with annual conclaves, guest lectures, and placement drives rather than deeply embedded collaborations that shape curriculum and assessment. If students expect clarity, institutions must offer structured pathways, not just ceremonial interactions.

Taking ownership

At the same time, the expectation gap cannot be explained solely by institutional shortcomings. Higher education is not a packaged service; it is an ecosystem of opportunity that rewards initiative.

Students who thrive typically begin exploring internships early, build project portfolios, participate in hackathons and research initiatives, approach faculty mentors proactively, and cultivate professional networks. They read beyond the prescribed syllabus and treat the campus as a laboratory of growth rather than a holding space before employment.

Preparedness for higher education must begin even earlier. Foundational literacy and numeracy, communication skills, digital competence and intellectual curiosity are prerequisites. However, many students enter college without having developed independent learning habits. The transition from being taught to taking ownership can be uncomfortable, but is indispensable.

Another contributor to

dissatisfaction is the way success is framed. If college is presented primarily as a placement pipeline, any deviation from immediate employment is perceived as failure. Employment outcomes matter deeply, but education must also cultivate adaptability, ethical reasoning and the capacity for lifelong learning. Developing the ability to navigate multiple career transitions over decades is important and institutions must communicate this distinction honestly, and students must internalise it realistically.

Way forward

Closing this gap requires coherence rather than cosmetic reform. Outcome-based education must shape pedagogy and assessment meaningfully rather than be a compliance requirement. Mentorship systems should be structured, measurable and accessible. Industry partnerships must inform curriculum design, not merely campus recruitment calendars. Experiential learning should begin early through internships, live projects, incubation ecosystems and research exposure. Transparency about programme outcomes, career pathways and skill expectations should be embedded from the first semester.

Equally, students must adopt a partnership mindset. Ownership, initiative, and resilience are essential in an economy increasingly shaped by automation and artificial intelligence. Waiting to be “placed” is an increasingly fragile strategy; building capability is a durable one.

The expectation-experience gap is not a crisis; it is a signal that India's youth expect more from higher education. Bridging the gap will require shared accountability. Perhaps that is itself the most important lesson college can impart.

The writer is the Provost of CMR University, Bengaluru.

Rajiv Gupta

India's education system has much to celebrate. Gross enrolment ratios in higher education have climbed from 10% in 2000 to over 28% today, with more than 43 million students enrolled in colleges and universities. Literacy has risen to 77%. The sheer scale of access built over two generations is a legitimate achievement.

Diminished attention
But access without engagement is an empty promise. Across many lecture halls today, seats are filled, screens are glowing, fingers are moving, but attention is thinning. According to a 2023 study by Emeritus, over 60% of college students admitted to being distracted by devices during lectures for more than half the class time. Faculty report that their energy, enthusiasm, and depth visibly diminish when they sense they have lost the hall. A teacher cannot give their best to an audience that has already left.

Today's student has grown up with YouTube channels that explain

quantum physics in eight minutes with animation, humour, and editing that no professor can match. Attention spans have measurably shortened; Microsoft Research noted a decline from 12 seconds in 2000 to around 8 seconds today. Gen Z learns visually, in bursts, with instant feedback. The generational gap between how a professor in their forties processes knowledge and how a 20-year-old absorbs it is not a character flaw on either side. It is a design mismatch that we have refused to acknowledge.

The deeper problem is the transactional nature of attendance itself. Remove the incentives of attendance requirements, mark sheets, degrees, and placements and many lecture halls would empty overnight. This is an indictment, not of students, but of a system that has allowed itself to become a credentialing machine

India's education system is losing the attention of the students it is meant to serve. Here is why and what must change

GETTY IMAGES/ISTOCKPHOTO

rather than a place of genuine transformation.

In the classroom
So, what can a classroom offer that an AI tool, a YouTube video, or a solo study session cannot? Group dynamics, friction, the presence of people who think differently from you, real stakes in real time. This is where education must

make its stand.
Consider what our students are actually unprepared for. There is a widespread romance with entrepreneurship with startups seen as the path to freedom, autonomy, and meaning. In reality, over 90% of Indian startups fail within five years. If we dive deeper, the skills that make a great entrepreneur – ownership, accountability, the willingness to sit with outcomes that are not going your way – are what make someone exceptional in a job or a family business. But we teach none of it.

We do not teach students how to work alongside people deeply unlike them; different in world view, work style, tempera-

ment. They must learn to hold it together, to make it work with the person who irritates them, whose logic they cannot follow. This is, perhaps, the most important professional skill and it is almost entirely absent from our curricula. The tolerance for difference, for friction, for slow consensus is dangerously low.

Power under pressure

Why stress isn't always bad

THINK
Aruna Sankaranarayanan

The term 'stress' receives bad press. So much so, that people deem all forms of stress as aversive and something to be avoided. In his book, *10 to 25*, psychologist David Yeager says that this "stress-is-debilitating belief" is pervasive in modern societies. However, stress is an endemic feature of life that we cannot live without. Though we need to minimise acute and chronic stress, that does not imply that we banish all stress from our lives. Rather, we may learn to differentiate various forms of stress and learn how to cope with milder forms to realise our full potential.

In a video titled *How to maintain healthy stress levels on Psyche*, psychologist Mirela Habibovic describes the "stress spectrum" and argues that there is an optimal level of stress that we require to thrive in certain situations. The stress system exists in our bodies to warn us of dangers and is essential to our survival. For example, if you are crossing the street and a car unexpectedly comes hurtling at you, your stress response kicks in, causing physiological changes in your body that help you dash onto the pavement to safety. Likewise, when we perform a mildly stressful cognitive task – taking a test you're

prepared for – more oxygen is diverted to your brain helping you focus better. In fact, the term 'eustress' is used to describe the beneficial or healthy forms of stress.

However, if we cling on to the notion that all forms of stress are harmful, we may not experience the positive impact of optimal levels of stress because we might shun any task that's mildly challenging. According to Yeager, we need to embrace a "stress-can-be-enhancing belief" to counter the negativity associated with all forms of stress.

While awareness of mental illness has grown considerably over the last decade or so as more people speak out about their struggles, it has had an unfortunate fallout. In *Losing Our Minds*, psychologist Lucy Foulkes says we have begun to pathologise "normal negative emotions and experiences." People are quick to categorise all forms of stress as toxic, failing to differentiate eustress from distress.

According to Habibovic, problems arise when the stress system is activated unnecessarily and often. Lack of sleep, an argument with a friend, pursuing a course that you despise, a boss ghosting you, or even your own negative thoughts can trigger the stress system. Habibovic says that our stress response also gets activated when we are not adequately stimulated, like being stuck in a boring job that doesn't engage us. So, both overstimulation and under-stimulation can evoke a stress response in us.

Strike a balance
Stress becomes toxic when it endures for a long time and you don't have sufficient "recovery time" between recurring bouts. You know that stress has reached unhealthy levels when you enter one stressful situation after another without adequate time to reset your mind and body. This is how you fall victim to either burnout or "bore-out", the two extremes of the stress spectrum, says Habibovic.

When you aren't being sufficiently challenged, you are likely to be unmotivated and bored. If you are given tasks at your level that meld with your interests, you are in your "comfort zone". Just outside this zone, when challenges stretch you slightly beyond your current capabilities, the stress levels are optimal, according to Habibovic. This is when your energy and creativity are likely to peak. But if the tasks continue to get more complicated and demanding, then you are likely to reach a state of burnout.

Habibovic acknowledges that it's okay to be at either end of the spectrum once in a while. But, by and large, we need to pursue tasks that let us operate in the middle ranges of the stress spectrum. Foulkes concurs that we should take "sensible precaution" to minimise "dangerous or traumatic situations", but at the same time we shouldn't shy away from "stress altogether."

The writer is visiting faculty at the School of Education, Azim Premji University, Bengaluru, and the co-author of *Bee-Witched*.

Dhairryya Agarwal

Somewhere right now, a student is staring at a blank document, convinced that the only way to write a graduate school application is to list every win, hide every struggle, and present themselves as picture perfect. I thought the same when I applied to Stanford's Master of Science programme in Management Science and Engineering in November 2024. My application was a picture-perfect highlight reel, the kind social media has attuned us to produce. Yet, in March 2025, it was rejected. My "why" was clear; so was how the programme would accelerate it. What I did not realise was that picture perfect was not the answer; it was the obstacle.

The missing link
Every student assumes they are not good enough when they open a rejection letter. I did too. But what I eventually learnt is that a rejection rarely says something about you; it says something about how you told your story. Three days after the rejection, with my family's encouragement, I stopped

Dr. Savitha Arun

The growing demand for allied healthcare professionals in India, especially in core disciplines such as optometry, is placing renewed attention on the quality of education and training frameworks that prepare them for frontline care roles. Optometry education in India has developed through multiple parallel pathways over time. Programmes have ranged from short-term diplomas to undergraduate degrees, often with differences in curriculum structure, duration, and clinical exposure. This has resulted in uneven skill development, particularly in areas such as diagnostic assessment and referral decision-making. In many cases, academic coursework has not been consistently supported by supervised clinical training, creating a gap between theoretical learning and real-world patient interaction.

New curriculum
The new education guidelines introduced under the National Commission for Allied and Healthcare Professions (NCAHP) Act,

FREEPIK

Tell a real story

A personal account writing and rewriting of a Statement of Purpose to reflect one's true personality

asking what went wrong and started asking what was missing. I shared the application with students in the programme. I reviewed it with a coach. The answer that kept coming back was that the application did not show who I was or what drives me. It was a profile, not a person.

That feedback gave me a direction, but I was not sure how to tell the story. Then it dawned on me that it is no different from the problems I have

solved throughout my education. Every prompt is a question in disguise. I had to sit with it long enough to hear what it was really asking, and build the storyline around that before writing a word.

I broke the statement of purpose prompt apart word by word and built a storyline before writing a sentence. Then I shared it, took feedback, and rewrote. Shared it with a different set of eyes, and rewrote again. I treated it

as a work of art; I would obsess over a single line for days, write something one night, start over the next morning, and redo it two days later. The storyline was rewritten more than three times. The SoP went through over 30 iterations.

Deep thinking
After eight months of burning the midnight oil, the essay had become deeply personal. That kind of depth demands authenticity, honesty, and transparency. And those do not arrive on the first draft; they surface only through deep thinking and rewriting.

Then something shifted. The other two essays came to me during my daily walks and I wrote them each in a single sitting. The months of rewriting had clarified something larger: the entire application needed to read as one person, not one résumé. I rebuilt each piece around a different personal attribute and re-did the letters of recommendation so each reinforced the application from a different angle rather than echoing the same points.

When the final application was done, I could feel

structured conflict, cross-cultural team projects must be the centre of any serious curriculum.

Woven through all this is something we have entirely stopped teaching: civic sense, deep listening, courteous communication, and the capacity for sustained analysis. Low attention span is not a generational quirk. It is the enemy of every serious profession, every functioning democracy, and every complex problem India must solve.

The shift in higher education is already visible. Students want to build, test, and ship real work. Institutions that create these conditions are pulling ahead. Reputation still has weight. But relevance now decides. Remove the degree, the certificate, and the placement numbers. What remains strong enough to earn a student's time and focus is the blueprint for the next classroom. Without it, education risks sliding into transaction instead of transformation.

The writer is the Chairperson, School of Family Business at Masters' Union and author of *The Good Indian Employee's Guide To Surviving A Lala Company*

the difference. For the first time, reading my own application, I recognised the person on those pages. Satisfied that it unfolded every shade of who I am, I reapplied in November 2025. On February 27, 2026, I was admitted to the programme. In that moment, something became clear: it is liberating to present the actual you and not the polished you. We love flawed stories; that is what makes us human.

Remember, the guidance online will give you a starting point. But your story is yours alone to tell; not the consultant's, not the LLMs', not your essay writer's. Do not be afraid to lead with what you have struggled with. The things you are most hesitant to share are often what make your story real. Treat your application like a work of art. And if you are that student staring at a blank document right now; you do not need a perfect application. You need an honest one.

The writer is a product manager at Microsoft who will begin the Management Science and Engineering programme at Stanford University, the U.S., later this year

sion therapy, perform low-vision assessments, and support basic disease screening in a supervised clinical environment.

This standardised curriculum will also help ensure that both graduate and postgraduate students of optometry develop consistent clinical skills in assessment and screening during their training. The competency-based modelling ensures that students are evaluated on monitorable skill outcomes such as patient examination and management, optical dispensing, documentation and professional conduct. Additionally, more weight is given to research capacity development at the postgraduate level; a step in the right direction.

Further improvements
However, there is scope for the curriculum to become more responsive to emerging needs. This requires education and training to be aligned with specialised and evolving areas of practice such as myopia management, advanced diagnostic imaging, tele-optometry, and community-based screening models. This will deliver effective in-person care in ur-

ban clinical settings while supporting remote consultations and community-led screening initiatives in underserved rural areas.

Strengthening academia-industry collaboration is another priority as this is key to activating employment readiness, supporting curriculum development and research participation and ensuring that student training remains aligned with technological advancements. Interdisciplinary workshops and academic-clinical forums also allow students to interact with clinicians and practitioners from diverse backgrounds and gain insight into varied patient management protocols.

Giving a facelift to optometry education cannot be viewed as an academic mandate alone; it is the deciding factor in how effectively primary eye care services will be delivered in the future.

The writer is Principal of Nethradhama School of Optometry and Medical Superintendent, Quality Assurance Coordinator, and Senior Consultant-Anterior Segment and Electrophysiology at Nethradhama Super Speciality Eye Hospital, Bengaluru.
